At Gibson Island five yachts of the racing class of the Gibson Island Yacht Squadron sailed in the first of a three-race series for the George A. Whiting trophy and six of the star-class yachts were out for the first time to sail in the initial fleet race.

Fresh Breeze Encountered

Four large cruising yachts and three of the racing class started at the same time to sail the course from Ferry Bar to Rock creek via Swan Point. A fresh breeze that heeled the craft far over was blowing as the yachts jockeyed for position. As the gun was fired, the Mary, sailed by O. L. Tiedeman and Martin Alsey, slid across the line to be first over. The Mary, noted for many years in local boating circles as a fast sloop, has bloomered forth again in her original style of rig after being rigged as a yawl for a number of seasons.

Next came Rowena, William Bertalan's sloop, followed by Virgi Trois, sloop owned by Stanley Trott, which forged rapidly to the front in the early part of the race. Sparkle, a Sound Interclub sloop owned by G. W. Youngkeve, of the Sparrows Point Yacht Club; Natalie, a yawl, Harry Sachs; Gleam, yawl, J. Leo Flanigan, of the Gibson Island Yacht Squadron, and Nirvana, Carl Dochtman's schooner, rounded out the racers.

When the yachts were off the grain elevators at Canton Gleam, the Flanigan yawl, was buffeted by two hard flaws of wind from either side which caused her parachute spinnaker and mainsail to foul. J. Leo Flanigan, Jr., son of the skipper of the Gleam, suffered a "scorched" hand when the spinnaker halyard was ripped from his hand and the sail dragged in the water. To free the canvas young Flanigan dived overboard to cut it loose. Persons on other yachts in the race thought he had been pulled overboard by the sail. The Gleam withdrew from the race.

This was the only untoward happening on the run from Ferry Bar to Swan Point to Rock Creek. Virt Trois, the Trott sloop, with Robert W. Wayland at the tiller, was the first boat to finish reaching the mark in Rock Creek at 5:16 P. M., and placing first in the racing class. The Mary was second and Sparkle withdrew.

In the cruising class Nirvana was first; Rowena second, and Natalie third.

Trophy Is Perpetual

Just before the start of the cruising and racing class, seven of the Snipe Class sloops of the Sparrows Point Club, which participated in the class racing at the Maryland Yacht Club on Saturday were sent off on a race from Ferry Bar back to their own clubhouse. The start was at 10:45 A. M., and Little Mac, Roger Girdling, the first to finish, arrived at Sparrows Point at 12:35.

The Maryland Yacht Club has put up a perpetual trophy, which is awarded each year to winner in this race.

The snipes finished in the following order: Little Mac, R. Girdling; Sampan, L. Wright; Clytie, M. Wrightson; Mermaid, W. Campbell; Skipit, McNeill; Canuck, F. Rushton, and Shim Sham, E. Lipsky.

The first race of the Whiting Trophy series brought out five of the racing class of the Gibson Island club. Quant, R. S. Mueller owner, was first over the line on the triangular Baltimore Light, Swan Point, Love Point course. Ballymona, a 10-meter sloop, owned by Richard E. Reed III, made her first appearance in local racing in the contest. She stepped out in front and held that position until Love Point had been rounded. Then Luke, A. H. Clephane, owner, took charge and headed the rest of the fleet to the finish line On corrected time Valkyrie, P. W. Howard was second; Amethyst, the Amethyst syndicate, third; Ballymona, fourth, and Quest, fifth. The trophy will be decided upon a point basis. The two other races will be run next Saturday and Sunday.

The first fleet race of the star class brought out a new boat, the Wave, built by the noted Eastern Shore yachtsman, Lowndes Johnson, and she distinguished herself. Sailed by her new owner, David Dunigan, the Wave went to the lead of the other stars early and was never headed on the windward and leeward course. Others finished in the order named: Flounder II, Emil Mosbacher, Crest, Randolph Fisher; Albacore, Donald Frey; Onward, G. Graham, and Kingfish, Art Markel.

Irish Booters Score

Boston, June 6 (AP)—Ireland's claim to worthy football team, the Maple Celts, was established today shading a 17-6 decision in a picked team of Massachusetts players.

Light Wins Auto Card

Lancaster, Pa., June 6 (AP)— Mark Light swept the speed events today and several previously. This was the seventh straight he has won in central Pennsylvania.

Total	17½	Total	12½

Mr. and Mrs. O. B. Coblentz won first low net honors in the mixed two-ball tournament held yesterday at the Rolling Road Golf Club. They carded a score of 111-36—77. Second were Claire Wilson and J. B. Donovan, with a 109-30—79. Third prize went to Mrs. Settle and F. Hoffrogge, with 106-24—82.

Ray Rever, club president, and Doris Rever, his daughter, won low gross prize, with 106. Other scores:

Mr. and Mrs. C. H. Hoffrogge	106	24	82
Mr. and Mrs. Claire Wilson	109	26	83
Mrs. G. Strickland and C. Keller	110	26	84
Mrs. Hinke and George Hemsath	110	26	84
Mr. and Mrs. Ray Rever	106	20	86
M. Strickland and W. Brandt	110	24	86
Mrs. B. B. Rose and C. Lodtke	115	26	89
Mr. and Mrs. Hoffrogge	111	20	91
Mr. and Mrs. George Mellinger	121	26	95

Entrants in the women's State championship golf tournament will play their final practice rounds today at the Five Farms course, where qualifying is scheduled tomorrow. Mrs. Betty Meckley, champion for the last two years, and Helen Dettweiler, crowned winner in 1934, will head a list of favored Washington entrants. Thus far 44 have entered, but post entries will be accepted.

Pros of the Middle Atlantic Association and amateur partners will complete today in a regularly scheduled tournament at Hillendale.

Interclub Tennis

• GIBBERISH •

By C. M. GIBBS

THORNCLIFFE PARK, up Toronto way, added an interesting chapter to the ancient game of horse racing when a race was run with one of the entries missing and then ordered run over again.

It developed that the horse which didn't start was an 80-to-1 shot. It came out nice and fresh for the rerun and easily trounced the tired nags. This made those who had won bets on the race as originally run feel swell.

In fact they did swell up with righteous anger, crowded on the track and came near breaking up the plant before the gendarmes, cops or whatever you call 'em managed to clear the malcontents, or irked fans.

It was all a very goofy proceeding as that at least had a touch of originality whatever else you may say against it. What I'd like to know, however, is where the heck was Lassie's Mary, the nag that failed to go to the post at first, and also why.

o—o

Hubbell Hasn't Improved Yet

SPEAKING of going to the post, there seemed to be those who thought that the fracturing of Hubbell's winning streak of 24 straight over two seasons would be beneficial, that he would be tougher to beat after the strain was removed.

Gosh knows if you can't beat a guy in 24 straight times you wouldn't want him any tougher. But anyhow the strain of the streak evidently hadn't worn off the other day when Hub was chased for the second straight time.

Truth is it may take a little time for the great southpaw to get himself straightened out again and start winning consistently.

o—o

SPEAKING about getting straightened out, that was a cute trick of Dizzy Dean's in sitting down on the mound to cool off during Saturday's game. I bet he'll think up some better ones than that before the season is over.

The mysterious angle about all this is that the umpires appear to be afraid to do anything and apparently the Cardinal management isn't inclined to.

It's all a very interesting phenomenon.

o—o

AND as long as interesting phenomenas are the subject, there is Catcher Bolton, of the Washington Senators. You know how Bolton joined the team and then suddenly decides to go home—and hails the team.

He has been doing this a long time. Only recently he decided to return to the Senators, was there a couple of days and now I understand he has disappeared again.

o—o

PERHAPS he would not love baseball half so much did he not love his home more, or vice versa.

At any rate, he is a strange young man. He at least has the courage of his convictions, whatever they are. He loves his own life, baseball slavery to the contrary notwithstanding.

While he has been at it he has caused Owner Griffith to pluck many a hair out of his eyebrows. And I wonder how they decide whether and when the club owes Bolton any back wages, or Bolton owes them service, or do they?

o—o

IT is interesting to note that the umpires forfeited a game against the Phils yesterday for stalling tactics. Stalling, as you know, simply means killing time.

It's true that Dizzy Dean was allowed to take 11 minutes to throw three balls at Charley Wilson a week or so back, and that the umps didn't do a thing about it.

And it's also remembered that Dizzy sat down on the mound to rest the other day with not a whimper from the umps about stalling. But the Phils, well that's different. They stall and the umps run in their wrath and take the game away from them.

o—o

Gosh, The Ideas Are Numerous

THE National League is making a swell name for itself this season.

It's got all the gag writers busy studying the daily sports pages for jokes ideas—and they are finding plenty.

o—o

AND while speaking of jokes and things you may notice that the French Davis Cup team was pushed out of the cup play by Czechoslovakia.

It seems only a short time ago that the great French players were blasting the United States forces over the cup picture.

They had their day in the sun and are now on the way out as the American netters appear to be coming slowly back on the trail.

Ranger Races Rainbow In Today's Cup Trial

Newport, R. I., June 6 (AP)—Ranger, Harold S. Vanderbilt's unbeaten candidate for defense of the America's Cup, tomorrow will meet Chandler Hovey's Rainbow, the sloop with which Vanderbilt vanquished T. O. M. Sopwith's challenger, Endeavour I, in another of the cup trial races.

Ranger has yet to win a race in the trial series. She was designed by both Ranger and Yankee in her first sailing tests, but, to each, hard luck pursued her. When Yankee beat her she blew out her mainsail on the second leg of a 30-mile triangular course when Ranger led by nearly a minute. In the race that favored the Vanderbilt entry by capturing a 45-mile test to windward into a stiff breeze after Rainbow had held the advantage the first five miles.

SNEAD FAVORED FOR GOLF TITLE

Rice Likes Long Hitter's Chances In U. S. Open At Oakland Hills

By GRANTLAND RICE

(Special Dispatch. Copyright, 1937.)

New York, June 6—If you happen to run across a number of betting commissioners or golf bookmakers this week, don't be surprised to see a drawn and haggard look upon their faces. Like Mother Machree, their "brows are furrowed and wrinkled with care."

The answer is a young ex-caddie from the hillbilly country of West Virginia, playing in his first open championship. For it so happens the play on Sam Snead has made him the betting favorite over such stars as Harry Cooper, Henry Picard, Gene Sarazen, Ralph Guldahl, Horton Smith, Johnny Revolta, Ed Dudley and others who have been occupying the top places for the last few years.

"If Snead wins I'll be wrecked," one prominent betting commissioner told me. "I've cut him from 18 down to 8 to 1 and still the money rolls in."

"There are forty men who can win the championship," I said. "Maybe more."

Course For Big Hitters

"I know it," he said, "but as ran Snead. This is a course for big hitters—and Snead is a big hitter. He can also play every other shot—including putting. And he's proved he can win in fast company."

Thinking of Sammy Snead at Oakland Hills, Detroit, this week carries me back to Skokie, Chicago, the year being 1922. All the talk then was around Walter Hagen and Bobby Jones. I was sitting with Damon Runyan as two ex-caddies came by, starting for the first tee.

Who are those two fellows? Damon asked.

"A couple of kids." I said, "by the names of Gene Sarazen and Johnny Farrell."

"Are they any good?" Runyan asked.

"They are both good enough to win," was the answer, "And both will before they are through."

Gene Holes Two 40-Footers

Gene and Johnny were then around 21—Gene with his barrel legs, and lanky Johnny in a sartorial makeup of orange, blue and green. Gene won that championship, a stroke in front of Bobby Jones and dear John Black—but Johnny had to wait six years for his famous playoff against Bobby Jones in the same city—Chicago.

How many keene that, in that Skokie championship, Gene, staggering and struggling, figured he was completely out of the running until he holed two 40-footers in succession? That was the spark that sent him spinning along to the front. I'll never forget young Gene, ex-caddie from Westchester, smoking a big cigar on the clubhouse porch as Bob Jones and John Black were coming in. Gene had finished at 288—seven fives. Someone came rushing up and said that Jones and Black had pars for the same figure. "That's all right with me," Sarazen said. "I've got mine."

Now we have about the same type challenging again in Sammy Snead. Once more an ex-caddie just out of the hamons—a West Virginia hillbilly in place of a Westchester Italian who had lugged clubs on sturdy legs since he was 11 years old.

Whether he wins or loses, Sammy Snead is one of the great golfers of the world today.

Starts With Gallery

Sarazen had his chance to ride along winning and unbridled. He had almost no gallery most of the way. Snead faces a rougher road. He starts with Johnny Goodman, another crowd pleaser, at 1:25 on Thursday, and he is almost sure to carry more than his share of the thundering herd. This is a distinct handicap. Especially for a young player in his first championship. Seventy per cent. of golf—maybe 80 per cent.—in the upper levels—is concentration. It isn't as easy to concentrate with a thumpeting mob charging all over the landscape, swirling around you.

I hope the gallery at Oakland Hills gives Snead his chance. I hope Snead can detach himself from the crowd—take it as another tournament—and play his game. For he has a game worth watching—he has everything except experience. He is a terrific hitter with a loose, willowy body—where body, hands and arms work together in amazing coordination.

But after all, in this field, you are shooting against 143 survivors from more than 1,0[illegible] starters. And you are in a game where anything can happen—and always does.

Armour Misses $300 Putt By Inch In Loss To Cooper And Smith

Toledo, Ohio, June 6 (AP)—Silver-haired Tommy Armour, veteran of the golfing wars, missed by an inch today a putt worth $300 as Lighthorse Harry Cooper and Horton Smith, the red-headed Joplin Ghost, grabbed the first prize of $1,000 in the third annual Inverness best-ball match-play tourney.

The heart-breaking 25-foot putt came on the final hole of the 128-hole tourney, providing the greatest finish the event has ever seen. Armour, winner of the National Open in 1927, and Thomson, not in the group's class at the game has ever known, needed a victory on the last hole to tie Smith and Cooper in the standings.

The 16 professionals scored 298 birdies and 64 eagles during the seven matches. 75 of the sub-par holes being recorded down the stretch.

BUDGE NAMED NET FAVORITE

Rated Even Against Field In Forthcoming Wimbledon Tournament

By the Associated Press

London, June 6 — England's biggest tennis bookmaker today listed Don Budge, red-headed American Davis Cup star, as an even-money favorite to win the all-England singles championship at Wimbledon.

Gottfried von Cramm, of Germany, was second choice at 2 to 1 for the tournament which begins June 21. Bunny Austin, England's leading amateur since Fred Perry turned pro, and Adrian Quist, Australian ace, were quoted at 6 to 1.

Henner Henkel, of Germany, was listed at 7-1; Bryant Grant, the "midget" United States Davis Cupper, and Vivian McGrath and Jack Crawford, of Australia, followed at 10-1, and Frankie Parker, United States; Roderich Menzel, Czechoslovakia, and Bernard Destremau, France, at 20-1.

Mrs. Hilda Krahwinkle Sperling, of Denmark, at 2 to 1, carried the shortest odds among the women. Helen Jacobs was quoted at 3 to 1, Anita Lizana, of Chile, 4 to 1, and America's Alice Marble and England's Dorothy Round at 6 to 1.

Germany Leads Italy In European Series

New York, June 6 (AP)—While the United States team was getting ready in Europe to prepare for the inter-zone round of their zone competition next Friday, Germany, the favorite took the lead in the quarter-final series with Italy.

Hungarians and Czechoslovakia quite tied to zero in the semi-finals by the same margin as Roderich Menzel and Henner Henkel defeated Bernard Destremau and Christian Boussus, respectively.

Belgium turned back Sweden 3-2 as Jacques Brugnon, playing Max Ellmer in the deciding match, defeated Karl Schroeder and Andre Lamot.

TENNIS EVENTS TO BEGIN TODAY

Men's And Women's State Championships To Start At Roland Park

Many Visitors Practice At Baltimore Country Club For Tourney

By CRAIG E. TAYLOR

New champions in both men's and women's divisions will be crowned in the State tennis tournaments scheduled to begin today at the Baltimore Country Club.

Berkeley Bell, victor in 1933, has since turned professional, and Thelma Smith, the California girl who won the women's title that year, will not defend the crown. Neither tournament was held last year.

In both events there will be many newcomers to local courts. Lots of them practiced yesterday on the Roland Park courts. Six youths from the University of California were on hand. So were many others from various institutions of higher learning, with more expected to arrive this morning.

Heads Seeded Eight

Barney Welsh, of Rockville, top-ranking player of the Middle Atlantic list and among the first 20 in national ranking, heads the seeded eight, with collegians taking most of the remaining places. Only Eddie Jacobs, placed sixth, made the grade from among local entrants. All the others are strangers here, but their records indicate that the fight for the crown will be an open one.

University of North Carolina, year in and year out one of the leaders in the collegiate field, has sent three of its regulars and three freshmen. University of Texas has a group headed by Lindsay Franklin, second seeded player. Princeton, Yale and Tulane all have capable racquet wielders in the competition, and the seeded list is not likely to reach the quarter-final round intact.

With the exception of the Davis Cup squad, bound for Europe and 10 it hoped possession of the international trophy, most of the capable players were communicated with by the committee and the result has been a field that promises some good tennis for the revival of the tournament.

Play Begins At 3 P. M.

Play will begin at 3 o'clock, and for the first day the committee will be somewhat lenient on defaults. Starting tomorrow, the default rule will be enforced strictly. It is hoped to conclude the preliminary and first rounds today, reducing the field to 32 tomorrow and 16 on Wednesday. If this is accomplished, the doubles tournament can begin on Wednesday with a fair chance of finishing at the same time as the singles—on Saturday afternoon.

The women's tournament also lists an unusual number of players not so very well known to local galleries. In fact, despite the placing at No. 1 of Mary Coates, from Washington, it is felt that a dark horse may win. Thirty players are entered in this tournament. Play will begin at 10:30 A. M. and continue for three hours.

Blues Win in Maryland Polo Club Match

1937 July Gibson Island Carnival

Full page : [HN00FU][GDrive]

Gibson Island Carnival Set For

Society Notes

By NORAH GITTINGS

GIBSON ISLAND, one of our most popular nearby summer resorts, will be in gala attire on Tuesday for its annual summer carnival, to be held all day for the benefit of the little Protestant Episcopal chapel, St. Christopher's-by-the-Sea. Mrs. Sifford Pearre is general chairman, assisted by Mrs. Walter Galloway as vice-chairman and Mrs. John R. Sherwood as publicity chairman.

For the children it is the big day of the season, everything imaginable being done for their entertainment. The day starts off at 10.30 A. M. with a gymkhana for them, including all kinds of games, a Punch and Judy show, a magician, a talking doll and animal circus, with plenty of soft drinks and ice-cream cones, all under the chairmanship of Mrs. James Sloan, assisted by Mrs. N. Taylor Kennedy, Mrs. Donald McKnew, Mrs. Merrell Stout and Mrs. Stover Foster. Mrs. Rentzell Cleaveland is in charge of the cake and candy committee.

Luncheon And Card Party

Luncheon will be served at the clubhouse, after which a card party will be held in the club from 2 until 4.30 P. M., under the direction of Mrs. Nathaniel S. Kenny. Her committee includes Mrs. Frank H. Linthicum, Mrs. Page Edmunds, Mrs. Edgar Snowden, of Washington; Mrs. E. B. Freeman and Mrs. Robert Miller.

At 2.30 P. M. the greatest excitement of the day comes for the children with the toyboat race under the direction of Mrs. Frederic C. Lee. Helping her will be George Penniman, John Donohue, Harrison Sadtler, of Annapolis; Harry Primrose and Stuart Symington Orrick. Prizes will be awarded to the winners. There will also be some one on hand to cut silhouettes.

In the evening the grownups come into their own with a sea-food supper and dancing, held in the clubhouse. Mrs. Thomas R. Symington is in charge, assisted by Mrs. Richard Breed, Mrs. L. Corrin Strong, of Washington; Mrs. C. Ellis Ellicott, Jr., Mrs. Lawrence M. Bailliere and Miss Margaret Bowen.

Reservations Are Many

Among those who have made reservations are Mr. and Mrs. Symington, Mr. and Mrs. Sifford Pearre, Doctor and Mrs. Merrell L. Stout, Mr. and Mrs. William M. Passano, Doctor and Mrs. Edmunds, Mr. and Mrs. Philip Frohman, Mr. and Mrs. Edward Palmer, Mr. and Mrs. Melville Grosvenor, Mr. and Mrs. Edgar Hoen, Mr. and Mrs. Bailliere, Mr. and Mrs. Edmund L. R. Smith and Mr. and Mrs. Sherwood.

St. Christopher's Day is open to the public and guest privileges of the club will be extended to all. On Tuesday Gibson Island will throw open its doors.

MRS. JOHN R. SHERWOOD

Mrs. John R. Sherwood, who is publicity chairman for the benefit to be given Tuesday for St. Christopher's-by-the-Sea, and Mr. Sherwood, who have long had a home at Gibson Island, are both enthusiastic about water sports

1940

The 1940 Census: In 1940, the Robert Swan Mueller I family in Baltimore, Maryland has added no new children since 1930, but they have moved. Robert Swan Mueller I is now 47 years old. Their oldest son, Robert Swan Mueller II, has apparently moved out of their Baltimore home. Their second child **John Freeman Mueller** is now 21 years old, and their daughters **Emilie G. Mueller** (age 19) and Elizabeth Mueller (age 17) are still in the home. Robert Swan Mueller I's job is now listed as *"a Broker at a Chemical company"*, which is assumed to still be at his own **R.S. Mueller Company** that he started in 1923 (Robert Swan Mueller I would have 17 years with his own company by now). (For full page from census, see : [HS000G][GDrive])

Returned From Miami

Mrs. Robert Swan Mueller and her daughter, Miss Emily Mueller, of Gittings avenue, returned Monday after spending several months at Miami Beach, Fla., where they took an apartment. Mrs. Mueller sons, Ensign John F. Mueller and Ensign Robert S. Mueller, Jr., were both stationed at Miami. Her other daughter, Miss Elizabeth Mueller, is a councilor for the summer at Camp Marlin, in Andover, N. H.

1942 - October - Military Enlistment

In October of 1942, **Robert Swan Mueller I** again completed a War enlistment card. *Robert Swan Mueller I was 49 years old at this time, so it is very strange that he is filling out registration at that age.* His home address of 6 Gittings Avenue in Baltimore, Maryland matches the 1940 US Census data. His continued employment at his chemical/brokerage company **R. S. Mueller Co.** is verified (now opened for almost 20 years) at 905 Garrett Building in Baltimore, Maryland. (Historic info on the Garrett Building can be viewed here : 1982-us-dept-of-interior-national-reg-historic-places-nomintation-706-baltimore-garrett-building.pdf / https://drive.google.com/open?id=1ENVPWcmYugZd4scE-pbBH40QUHOzYh7I).

MISS ELIZABETH ANN MUELLER

The engagement of Miss Mueller and Second Lieutenant Benjamin A. Bosher, USMCR, of Richmond and Baltimore, is being announced today by her parents, Mr. and Mrs. Robert S. Mueller

Miss Mueller Engaged To Marine Lieutenant

MR. AND MRS. ROBERT SWAN MUELLER, of Gittings avenue, have announced the engagement of their daughter, Miss Elizabeth Ann Mueller, and Second Lieutenant Benjamin A. Bosher, USMCR, son of Mr. and Mrs. Lewis H. Bosher, of Richmond, Va.

Miss Mueller was graduated from Miss Hall's School, Pittsfield, Mass., and made her debut here in 1941. Lieutenant Bosher is a graduate of the Massachusetts Institute of Technology, class of 1940, and is a member of the Delta Psi Fraternity. Prior to joining the Marine Corps a few months ago, he lived in Baltimore several years.

The wedding will take place September 11.

Mr. and Mrs. Gresham H. Poe will leave the middle of the month for Magnolia, Mass.

Mrs. George Weems Williams has left for Craftsbury Common, Vt. Mrs. John S. Gibbs plans to go to the resort later. Every summer she visits Mrs. J. H. Covington, of Washington, who has a summer home at Craftsbury.

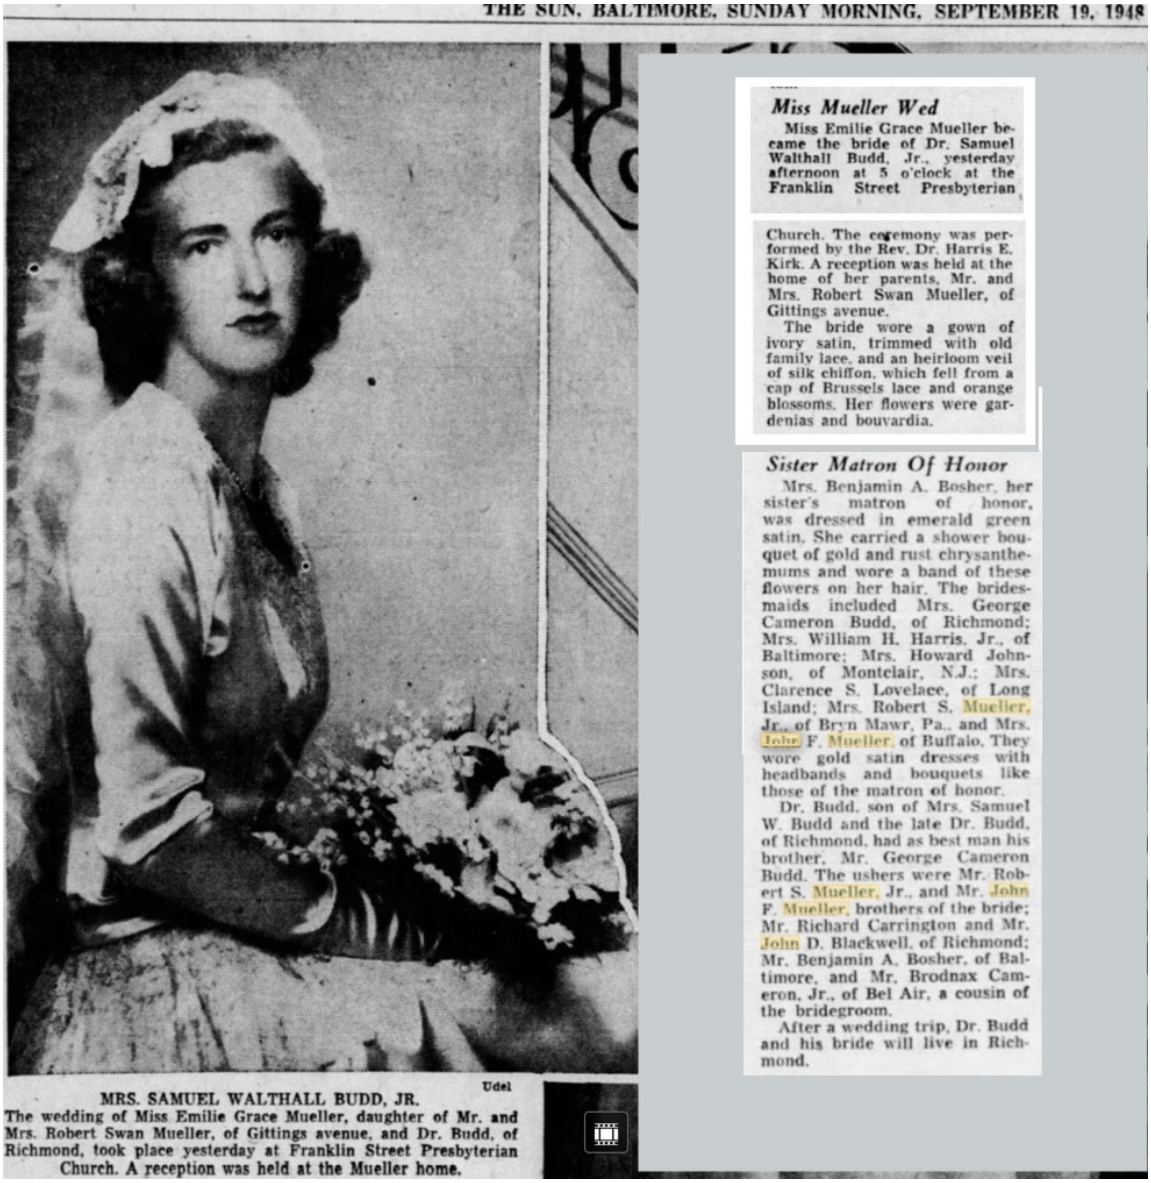
1948 (September) - Wedding of daughter Emilie Grace Mueller to Dr. Samuel Walthall Budd

(See full page in 1948 newspaper at [HN00FI][GDrive])



THE SUN, BALTIMORE, SUNDAY MORNING, SEPTEMBER 19, 1948

Udel

MRS. SAMUEL WALTHALL BUDD, JR.
The wedding of Miss Emilie Grace Mueller, daughter of Mr. and Mrs. Robert Swan Mueller, of Gittings avenue, and Dr. Budd, of Richmond, took place yesterday at Franklin Street Presbyterian Church. A reception was held at the Mueller home.

Miss Mueller Wed

Miss Emilie Grace Mueller became the bride of Dr. Samuel Walthall Budd, Jr., yesterday afternoon at 5 o'clock at the Franklin Street Presbyterian Church. The ceremony was performed by the Rev. Dr. Harris E. Kirk. A reception was held at the home of her parents, Mr. and Mrs. Robert Swan Mueller, of Gittings avenue.

The bride wore a gown of ivory satin, trimmed with old family lace, and an heirloom veil of silk chiffon, which fell from a cap of Brussels lace and orange blossoms. Her flowers were gardenias and bouvardia.

Sister Matron Of Honor

Mrs. Benjamin A. Bosher, her sister's matron of honor, was dressed in emerald green satin. She carried a shower bouquet of gold and rust chrysanthemums and wore a band of these flowers on her hair. The bridesmaids included Mrs. George Cameron Budd, of Richmond; Mrs. William H. Harris, Jr., of Baltimore; Mrs. Howard Johnson, of Montclair, N.J.; Mrs. Clarence S. Lovelace, of Long Island; Mrs. Robert S. Mueller, Jr., of Bryn Mawr, Pa., and Mrs. John F. Mueller, of Buffalo. They wore gold satin dresses with headbands and bouquets like those of the matron of honor.

Dr. Budd, son of Mrs. Samuel W. Budd and the late Dr. Budd, of Richmond, had as best man his brother, Mr. George Cameron Budd. The ushers were Mr. Robert S. Mueller, Jr., and Mr. John F. Mueller, brothers of the bride; Mr. Richard Carrington and Mr. John D. Blackwell, of Richmond; Mr. Benjamin A. Bosher, of Baltimore, and Mr. Brodnax Cameron, Jr., of Bel Air, a cousin of the bridegroom.

After a wedding trip, Dr. Budd and his bride will live in Richmond.

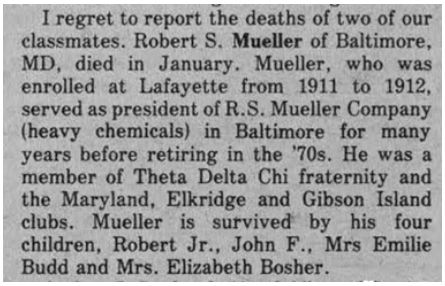
1970(s) - Retirement

In the 1970s (unknown date, but absolutely no earlier than April 1971), Robert Swan Mueller I retired according to his obituary from the May 1981 issue of Lafayette Alumni News (full issue here: [HE000I][GDrive])

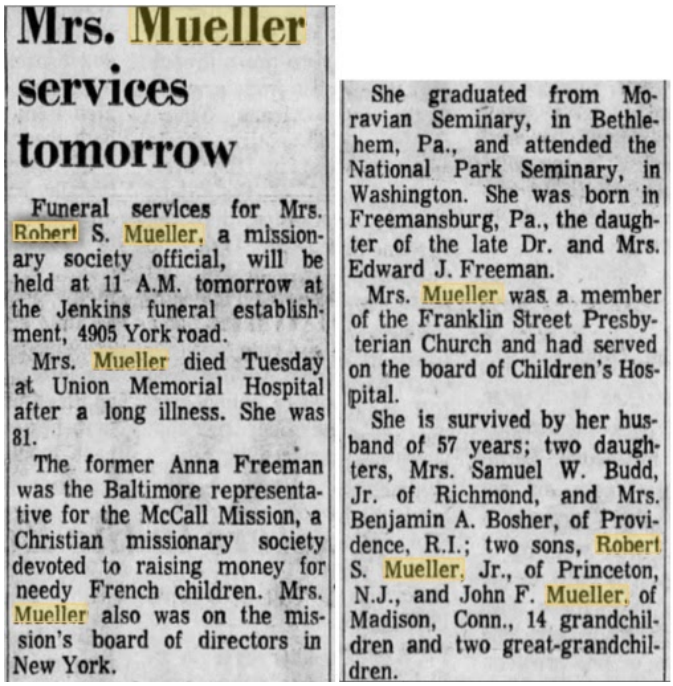


I regret to report the deaths of two of our classmates. Robert S. **Mueller** of Baltimore, MD, died in January. Mueller, who was enrolled at Lafayette from 1911 to 1912, served as president of R.S. Mueller Company (heavy chemicals) in Baltimore for many years before retiring in the '70s. He was a member of Theta Delta Chi fraternity and the Maryland, Elkridge and Gibson Island clubs. Mueller is survived by his four children, Robert Jr., John F., Mrs Emilie Budd and Mrs. Elizabeth Bosher.

[HE000J][GDrive]

1973 (May) - Death of wife Anna Elizabeth Freeman Mueller

Anna Mueller passed on May 8, 1973, at age 81 [HL001A][GDrive]. A news article regarding funeral services can be found below (full page from Baltimore Sun visible here : [HN00DZ][**GDrive**]).



Mrs. Mueller services tomorrow

Funeral services for Mrs. Robert S. Mueller, a missionary society official, will be held at 11 A.M. tomorrow at the Jenkins funeral establishment, 4905 York road.

Mrs. Mueller died Tuesday at Union Memorial Hospital after a long illness. She was 81.

The former Anna Freeman was the Baltimore representative for the McCall Mission, a Christian missionary society devoted to raising money for needy French children. Mrs. Mueller also was on the mission's board of directors in New York.

She graduated from Moravian Seminary, in Bethlehem, Pa., and attended the National Park Seminary, in Washington. She was born in Freemansburg, Pa., the daughter of the late Dr. and Mrs. Edward J. Freeman.

Mrs. Mueller was a member of the Franklin Street Presbyterian Church and had served on the board of Children's Hospital.

She is survived by her husband of 57 years; two daughters, Mrs. Samuel W. Budd, Jr. of Richmond, and Mrs. Benjamin A. Bosher, of Providence, R.I.; two sons, Robert S. Mueller, Jr., of Princeton, N.J., and John F. Mueller, of Madison, Conn., 14 grandchildren and two great-grandchildren.

Robert Swan Mueller II (born 1916)

Robert Swan Mueller II , age 47, Princeton 25-yr yearbook photo

---

Robert Swan Mueller II was **born on July 30, 1916**, in Pittsburgh Pennsylvania [HL0019][GDrive].

Robert Swan Mueller II is the son of **Robert Swan Mueller I (born 1893)** , and father of **Robert Swan Mueller III (born 1944)** . He is also the older brother of **John Freeman Mueller (born 1919)** .

1916 (July) - Born

Robert Swan Mueller II was born on July 30, 1916, in **Pittsburgh Pennsylvania** [HL0019][GDrive]. His name at the time was **Robert Swan Mueller Jr**.

1930

The 1930 Census: In 1930, the Robert Swan Mueller I family in Baltimore, Maryland has grown and appears to be thriving. Robert Swan Mueller II is now 13 years old, lives with his father, mother, 3 siblings, and one servant. His younger brother **John Freeman Mueller** is now 10 years old. The new siblings are sisters **Emilie G. Mueller** (age 9, born in 1921) and **Elizabeth Mueller** (age 7, born in 1923). In 1930, the Mueller household still employs one servant (now **Maurine Scott**, a female from Virginia who is 21 years of age). The occupation of father Robert Swan Mueller I on the 1930 Census is now listed as a "*Broker in the Banking industry*", which we know that he opened his own company **"R.S. Mueller Company"** in March 1923. (For image of Census doc see [HS000F] [GDrive]).

1932 - HS

24 THE EVENING SUN, BALTIMORE, WEDNESDAY, APRIL 20, 1932

It's All In The VIEWPOINT by Paul Menton Sports Editor

New Fans; New Favorites

THEY are still eating it up. They are just as enthusiastic as ever. They are just as partisan. They suffer and they triumph with their favorites. They are worn out at the end.

I refer to the wrestling fans.

I sat among them last night from the first bout until the last. I was right up in the midst of the bleachers, where the real critics are located each Tuesday night.

It was the first time in many months I have sat through the entire weekly program. Ed Contos arranges and I get quite a shock.

There was a new group of fans attending the shows today than once each week when John Contos first revived wrestling here nearly three years ago.

But if the hangs in the audience was a shock — me I got a bigger one as the matches went on. There's an entirely new group of matmen providing the thrills for these new fans.

Reaction Just The Same

LATER I inquired from Joe Kelly, secretary of the Maryland Athletic Commission, re: his doormen, who have been on the job throughout the regime of wrestling here, as to whether the old fans have deserted.

"No," replied Joe. "After about a year they stop coming every week. They now come when certain of their favorites are on the card. But their places at the weekly shows were taken by others. Pretty soon this crowd will take a rest and the others will be coming out again more frequently. Few drop out entirely. The action holds them."

There was a different audience, but the fans react to the shows in the old manner.

They become all wrapped up in the bouts. They strike and cringe with their favorites. They lose themselves in the roughhouse that is taking place on the mat. They imagine themselves delivering the blows.

Go Through The Motions

A CHAP next to me nudged me in the ribs. I looked around, thinking it as some one I knew. He was watching the ring. Then he jabbed me again. Finally he gave me a rather stiff jolt.

At that I called his attention to the fact that he and I were not wrestling. He got red in the face and apologized. He didn't realize he had poked me. He had simply been helping George McLeod get in a few blows on Mike Rossano.

A little later, about two rows in front of me, a small middle-aged man, weighing about 140 pounds, stood up shaking his fist and calling Frank Speera a "dirty bum." He was immediately challenged by Speera's admirers and for a while it looked like we might have an extra attraction.

I did not have to see the bout between George Zaharias and Cueball Kvariani, the feature of the evening. A party of four, two men and two women, all pulling for the Greek, sat to my right. I simply watched the expressions on their faces.

Wrestling Hard Life

THESE little occurrences around me were not unusual. They take place continually all over the house every time a wrestling show is held, regardless of the city, state or section.

These wrestlers have been doing things to people now for nearly three years, from Maine to Florida and from New York to California, and so long as they can make people forget themselves, can stir them, they will remain in the spotlight.

But what about the wrestlers themselves?

How long will they continue to stand the constant grind night after night? There's a lot of new fellows in the game. They are big. They are strong. They are young.

But they take some awful beatings physically. They do not know the tricks of the oldtimers and they are not allowed to learn them because the public wants action. It wants blood. It would not be adverse to a murder or two at times and wrestlers cater to the wants of the fans.

We are going to have punch drunk wrestlers around the country just as surely as the land is infested with punch drunk fighters.

Zaharias An Example

THERE is more punching, more wild diving, more throwing of men around the ring and through the ropes than ever before.

There was less wrestling and more action last night than a year ago and the action then was faster than the year before that.

As big as are those bulls that now arouse the audiences they are getting hurt with more frequency. They quietly drop out for a while.

The show goes on, with others in their place.

Take, for instance, last night. Ed Brockman, referee of the early bouts, told me Frank Speers had burned a blood vessel in his eye and the doctor told him it was dangerous for him to work for at least a week.

Then there is George Zaharias, the "big shot" here at present. In the last two years he has taken some unmerciful beatings in the ring. He won't quit. Of course, he gives some brutish ish, too.

And that's the reason he is so popular here today. He arouses the fans. He makes them forget themselves. You can watch them suffer and triumph with him—they work hard.

TICK ON TO RACE AT 'GRAW ON SATURDAY

JIMMY PARKS, HURT, DUE BACK IN JOHNNY STICK LINE-UP SOON

St. John's Twelve Points For May Tilts—Terps First Big Foe

By Paul Broderick

NEARING the turning point in the regular season, St. John's College's lacrosse team is looking ahead to the more decisive games on its schedule with the prospect of having greater resources at its command than even the most ardent Johnnie follower had hoped for a month ago.

When speaking of St. John's decisive games, the clash that the Annapolis outfit has with Maryland on May 7 at College Park first comes to mind.

To Spring Parks

By the time the Terrapin game rolls around, Dinty Moore, St. John's coach, expects to give his defense just the touch it needs by springing Jimmy Parks, veteran close defense stickman, into action.

Parks, one of the few holdovers from the crack 1931 team at St. John's, has been unable to play so far due to an injury. However, Parks is fast recovering and he is expected to break into the line-up almost any day now.

As a defense player, Parks had few equals last season. He is big and rugged and an expert stickhandler. When he gets into uniform again, Moore will have Phil Letz paired with Parks at point and cover point, with Sonny Jim Morris at first defense and Larry Carpenter, second defense.

Few New Faces

The only new faces in the Johnny line-up then will be Gibbs LaMotte, at goal, and Ed Williams, third defense. Both of the latter jumped from the Freshman team of last year to the varsity this season.

A defense combination of the known capabilities of these players should give Moore a feeling of security.

The attack is a hodge-podge of 1931 veterans and newcomers. Johnny Trader, center; Bill Zeigler, third attack, and Bill Athey, outhouse, are action last year as regulars, while Willie Lynch broke into things occasionally.

Lynch plays first attack. Doug Ranzay, in home, and Carl MacCartney, second attack, are new but were familiar with lacrosse, both coming up from the freshmen team.

Fans Must Wait

It seems that curious stick people hereabouts anxious to see St. John's under pressure will have to bide their time until the Terrapins take their annual crack at the Johnnies at College Park.

On Saturday, St. John's plays Penn State at State College, Pa., and the following week the team is away again, playing Colgate at Hamilton, N. Y. Then comes Maryland.

Sutherland, Mentor Of North's Gridmen, Visits Jackson Here

Jack Sutherland, football coach at the University of Pittsburgh, who has agreed to act as coach of the Northern team next fall in the North-South football game, which is scheduled for the Stadium on December 10, was in Baltimore for a short while today.

He paid a visit to Mayor Jackon and then left for Washington.

It is expected that an announcement will shortly be made as to the coach of the Southern team.

Week-End Busy

The Shamrock A. C. will play the Blue team Saturday at Carroll Park in the opening game of the Industrial League. Sunday the Shamrocks will travel to Pimlico to take on the All-Stars at the latter's oval. May 1 is open for a game to be played away Gardenville, Overlea, Essex or Middle River nines preferred. Address Fay MacGabee, 851 Mangold street.

Golf's Goofiest Goofs Glorified By Gambol

By Jean Rouchard

GOLF etiquette will have no place in the scheme of things tomorrow when Maryland State Golf Association divot lifters usher in the competitive season with a novelty tournament at Rolling Road. Officially termed a "goofy" competition the affair is fashioned after the hilarious links parties common in the mid-West, and State officials are quite cognizant of the fact that good golf may be conspicuous by its absence, what with musicians stationed at various points on the course and prizes being awarded for grotesque costumes and achievements not generally recognized in hard and fast tournaments.

Unusual Rewarded

True, worthy feats will be properly rewarded, but the prize list fairly bugles with awards for out-of-the-ordinary accomplishments.

Starting at 9 o'clock in the morning when the notes of "How I Hate To Get Up In The Morning" will pierce the atmosphere of the usually placid Catonsville countryside, the linksmen will attempt to play 18 holes of golf.

Saxophones will blare forth mournful notes, and cymbals will clash as the club swingers tee up and try to sink their putts. Contestants will be allowed to run, walk, talk or shout during the proceedings; as a matter of fact, anything not in keeping with the fine traditions of the ancient and honorable game will be tolerated.

Feast In Order

Following the putt-putt on the greensward, the golfers will gather around the festive board, and during the dinner prizes will be awarded the successful contestants. The prize-winners must remain for the dinner to receive their prizes.

According to Ed Peppler, president of the State Association, the Baltimore Country Club would be represented by approximately 50 golfers, while all the other clubs hereabouts will have numerous linksmen playing.

Woodholme Country Club will be the scene next Tuesday of the State Association's first 18-hole medal tournament.

The usual three classes will vie for prizes, and only those golfers who possess 1932 association handicap cards will be eligible to compete.

Following the usual custom, the players can make up their own foursomes and play in the forenoon if they so desire.

And You Can See These Clever Young Athletes In Action By Traveling Out To Roland Park

BOBBY MUELLER PEPPER CONSTABLE COOPER WALKER

BASEBALL and lacrosse are two big pastimes at Gilman these days, and the young men you glimpse above are stellar performers on the stick and diamond teams at Roland Park. Constable is a hard-hitting ball player, while Mueller and Walker are rated two of the best stickwielders wearing the Blue and Gray. Friday the Gilman lacrosse team plays Poly at Homewood, while today Constable was to be in action against the Forest Park ball nine.

EIGHT NET MATCHES FOR FORESTER TEAM

Forest Park High School's tennis squad faces a schedule of eight matches this spring. The card had nine tests until the Foresters have already played one opponent.

A strong nucleus is on hand to carry on for Forest Park this year. The Green and Gray has been very successful during the past few years, winning the Maryland Scholastic championship two years in the last five.

Earl Shaver, Herbert Fribush, Sylvan Goldberg, Tom Conner and Jacob Selis are veterans in the line-up.

The schedule follows:

April 23—Towson High, home.
April 26—Catonsville High, away.
April 30—Western High, Washington, away.
May 3—Mount St. Joseph's, at home.
May 7—Knox Police, away.
May 14—Towson High, away.
May 18—City tilts, home.

Chippewa Win

The Chippewa A. C. defeated the Martin A. C., 24-21.

Hornsby Sees Hurling Key To National Pennant Race

Cub Boss Relies More On Moundsmen Than Sluggers—Says 93 Or 94 Games Will Win Flag, .335 To .350 Bagging Swat Crown

By George Kirksey

CHICAGO, April 20 (U.P.)—This is an interview with Rogers Hornsby, who has his ideas about baseball and isn't afraid to speak them. Hornsby is entering his second full season as manager of the Chicago Cubs, has put in 17 years in the National League, held the batting championship seven times, and three times in his career hit more than .400.

"How do you size up the National League race?"

Pitching To Decide

"Four or five teams will battle for the pennant and pitching will be the deciding issue," says Hornsby. "St. Louis is weaker than last year. They will miss Haley's hitting and Grimes' pitching. The Giants have a strong team except in the box.

"Cincinnati has lots of hitting strength but outside of Johnson and Lucas they don't seem to have much pitching. Brooklyn is hard to figure because of their many changes. Pittsburgh is an improved team over last year. I don't know anything about Boston or Philadelphia."

"What about your team?"

"The Cubs rank as good as any of 'em. I call my pitching staff the best in the league. I have nine nine pitchers to—are going to be winners. They are Root, Malone, Bush, Grimes, Warneke, Smith, Baecht, May and Tinning. We may lack hitting strength but I figure pitching is 80 per cent. of any team and we may get by without any real sluggers."

Looks To Grimes

"How many games will Grimes win?"

"He's been set back by the flu and an infected tooth which he had pulled Monday in St. Louis but he'll win from fifteen to twenty."

"Do you consider yourself through as a player?"

"No. I may have to get in there later if we don't now enough hitting strength. That's one of the things we'll have to decide when we come to it. Right now Herman and Hack, the two young infielders, are making good. They'll make a few mistakes, but they are hustlers and good ball players."

"How many games will win the National League pennant?"

"Ninety-three or ninety-four." (The Cardinals won 101 last year and 92 in 1930).

Changes In Game

"Any noticeable changes in baseball?"

"Yes, the game is going back to speed. Base running, pitching and pitching. Three isn't likely to be one outstanding hitter, and anywhere from 325 to 350 probably will win the batting championship."

"Do you have any good base runners?"

"Yes, I have players like Cuyler, Herman, Hack and Hemsley, who will

Dan'l Turns Greedy

DEAR EDITOR—Once again I did better than break even, but, fans, I don't care for that sort of thing. I'm greedy. Like to win 'em all and that's what I'm out to do today . . . when, if possible. Had a winner at the Stadium yesterday and some of my baseball boys won, but not enough to suit me. Now for today:

Orioles to beat Montreal.
Toronto to beat Jersey City.
Buffalo to beat Reading.
Newark to beat Rochester.
Senators to beat Red Sox.
A's to beat Yanks.
Phils to beat Giants.
Reds to beat Cubs.
Cards to beat Pirates.
Gilmen to beat Forest Park, baseball.

Tred Aron at 'Graw.

Yours,
DAN.
W. L.
Dan's record 358 180

White Sox Woefully Weak On Offensive

Chicago, April 20 (AP)—The early suspicion that Chicago White Sox batsmen would not push back fences with their drives this season already is becoming a fact.

In their last three games with Cleveland, all of which were lost, the Sox collected just eighteen hits and all of them were singles.

INTERCITY SCRAPS BOOKED TO AID FUND

Washington amateur boxing stars will match punches with leading simon pures of Baltimore tonight on a program to be held at the former site of the Carroll Outing Club, 3134 Frederick avenue, which is now the Cross Country Club.

The proceeds of the show will be turned into the local Olympic Fund. Al Farrell, heavyweight titleholder of the District of Columbia, will perform in the feature bout. Farrell's opponent will be Walter Richmond, of the host organization, the only battle to gain a draw with Duke Crinkley, present South Atlantic champion. The card follows:

[illegible] vs. Earl Dixon, Washington, vs. Joe Bernard, Billy A.
[illegible] Charles Jones, Washington, vs. Jack Hall, Baltimore, 3 rounds.
[illegible] Pinkie Hall, Washington, vs. Jack Hall, Baltimore, 3 rounds.
[illegible] Bobby Ross, Washington, vs. Bobby Ross, Washington, vs. Jack Hall, Baltimore, 3 rounds.
[illegible] Bobby Ross, Washington, vs. Charles Mack, Baltimore, 3 rounds.
[illegible] Harry Haas, Washington, vs. Harry Haas, Washington, 3 rounds.
[illegible] Jones, Washington, vs. [illegible] Jones, Washington, 3 rounds.
[illegible] Jones, Washington, vs. [illegible] Jones, Washington, 3 rounds.
[illegible] Washington, vs. Charles Mack, Baltimore

ALICE TRUESDALE WILL BE MARRIED

Graduate of Miss Hall's School Is Fiancee of Lieut. Robert S. Mueller Jr. of Navy

WEDDING SET FOR AUTUMN

The Prospective Bridegroom Is an Alumnus of Princeton University, Class of '38

Lieut. Commdr. Melville D. Truesdale, USNR, and Mrs. Truesdale of 580 Park Avenue have announced the engagement of their daughter, Alice, to Lieut. Robert Swan Mueller Jr., USNR, son of Mr. and Mrs. Mueller of Baltimore. The wedding will take place in the early autumn.

Miss Truesdale was graduated from Miss Hall's School, and was introduced to society in 1938. She is a granddaughter of the late Mr. and Mrs. William Haynes Truesdale of this city and of the late Mr. and Mrs. Frederick William Moss, also of New York; a niece of Mrs. Richard Bissell of Washington and of the late Mrs. Jonathan Bulkley.

Lieutenant Mueller was graduated in 1938 from Princeton University, where he was a member of Cap and Gown.

1943 (Sep) - Marriage to Alice Truesdale

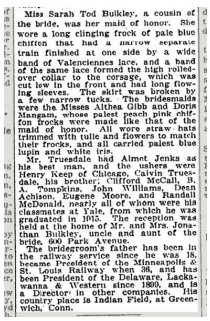
ALICE TRUESDALE'S PARENTS

*The **William Haynes Truesdale** is the grandfather of Alice Truesdale. He was the president of the **Lackawanna** **Railroad** back 1917. He was previously president of the Minneapolis and St. Paul railway by age 36.*

*LINK to 1917 news article : **WAR HURRIES NUPTIAL OF M.D. TRUESDALE; Son of Lackawanna's President, a Member of Coast Defense Reserve, Weds Miss Alice Moss.** Another link in the long chain of hurried war weddings was forged yesterday afternoon when the marriage of Melville Douglas Truesdale, youngest son of William Haynes Truesdale, President of the Lacka... https://timesmachine.nytimes.com/timesmachine/1917/05/13/102342728.html?action=click&pageNumber=16*

WAR HURRIES NUPTIAL OF M. D. TRUESDALE

Son of Lackawanna's President, a Member of Coast Defense Reserve, Weds Miss Alice Moss.



Miss Sarah Tod Bulkley, a cousin of the bride, was her maid of honor. She wore a long clinging frock of pale blue chiffon that had a narrow separate train finished at one side by a wide band of Valenciennes lace, and a band of the same lace formed the high rolled-over collar to the corsage, which was cut low in the front and had long flowing sleeves. The skirt was broken by a few narrow tucks. The bridesmaids were the Misses Althea Gibb and Doris Mangan, whose palest peach pink chiffon frocks were made like that of the maid of honor. All wore straw hats trimmed with tulle and flowers to match their frocks, and all carried palest blue lupin and white iris.

Mr. Truesdale had Almet Jenks as his best man, and the ushers were Henry Keep of Chicago, Calvin Truesdale, his brother; Clifford McCall, B. A. Pomplins, John Williams, Dean Achison, Eugene Moore, and Randall McDonald, nearly all of whom were his classmates at Yale, from which he was graduated in 1915. The reception was held at the home of Mr. and Mrs. Jonathan Bulkley, uncle and aunt of the bride, 640 Park Avenue.

The bridegroom's father has been in the railway service since he was 18, became President of the Minneapolis & St. Louis Railway when 36, and has been President of the Delaware, Lackawanna & Western since 1899, and is a Director in other companies. His country place is Indian Field, at Greenwich, Conn.

bride, 640 Park Avenue.

The bridegroom's father has been in the railway service since he was 18, became President of the Minneapolis & St. Louis Railway when 36, and has been President of the Delaware, Lackawanna & Western since 1899, and is a Director in other companies. TRUESDALE COONNECTION TO BISSELL FAMILY

Robert Mueller's great aunt (mom's side) married a #Bissell ... what are the odds ? (see https://pbs.twimg.com/media/DxeiWoGWsAAlIMi.jpg)

#RobertMueller is related to By Richard M. Bissell, Jr. ... "Richard Mervin Bissell Jr. was a Central Intelligence Agency officer responsible for major projects such as the U-2 spy plane and the Bay of Pigs Invasion." (see https://pbs.twimg.com/media/DxejTi-WwAAZajU.jpg)

1943 (November / December) - In Florida

From the Dec 3 1943 issue of Princeton Alumni Weekly (see the full page at [HE000O][GDrive] / Princeton Alumni Weekly, Volume 44 in full (Sep 1943 to Summer 1944) available at [HE000M][GDrive]): It says that in November (of 1943), **Mr. and Mrs. Robert Swan Mueller** attended a Princeton reunion dinner along with 45 other Princetonians in Miami, most of them stationed at the Sub-Chaser Training Center in Miami, Florida. A Submarine Chaser (or "SC") is a small and fast naval vessel that is specifically intended for anti-submarine warfare. Many of the American submarine chasers used in World War I found their way to Allied nations by way of Lend-Lease in World War II. (WikiPedia - https://en.wikipedia.org/wiki/Submarine_chaser).

SEE HTTP://WWW.SPLINTERFLEET.ORG/

Over 40,000 men served on subchasers in World War II, and in those days the word "Subchaser" was as familiar to the folks at home as the words "PT Boat," "Tin Can Destroyer," "Liberty Ship" and "Jeep Carrier." Today only the people who lived during that time remember that subchasers existed and even many of these have forgotten about them. That's because subchasers didn't have the glamour of PT boats, the power and speed of destroyers, or the silent mystery of the submarines. Consequently they weren't romanticized by the media and kept in the public eye.

The **U.S. Navy Sub Chaster Training Center** in Miami, Florida is shown below in this May 11, 1942 photo. (80-G-16043 U.S. Navy sub chaser training center, Miami, Florida)

[HW001K][GDrive]

A week later, in the December 10 1943 issue of the Princeton Alumni Weekly, we read that Robert Swan Mueller II is decommissioning his old ship in Miami, turning her over to a foreign government under lend-lease. He them comes to N.Y. to get a new and better subchaser. (Princeton Alumni Weekly, Volume 44 in full (Sep 1943 to Summer 1944) - [HE000M][GDrive])

38 CHARLES A. POWERS

New York City 18

Ken Frick is now in the Navy at the Sampson Naval Training Station. He is studying for a commission and he is working now as a chief clerk. Lt. (j.g.) *Robert Mueller* is decommissioning his old ship in Miami, turning her over to a foreign government under lend-lease. He then comes to N.Y. to get a new and better subchaser. Married Alice Truesdale of N.Y., Sept. 3.

[HE000N][GDrive]

1944 (Feb)

From the Feb 1944 issue of the Princeton alumni weekly : *"Lt. (j.g.): **Bobby Mueller** [aka Robert Swan Mueller II] has been in New York for a short time, fitting out a new type PC boat; then out to sea again."* (Full page : [HE0014][GDrive] / Clip : [HE0015][GDrive])

1944 (Aug) - Birth of first son (Robert Swan Mueller III)

Robert Swan Mueller III was born on August 7, 1944. The birth took place at Doctors Hospital in the New York City borough of Manhattan , most likely because father Robert Swan Mueller II was in NYC in the US Navy at the time.

1945 (Feb) - Robert Swan Mueller II Navy assignment

Record of Lt. Robert Swan Mueller II, 1945 assignment to USS PC 1169. File number 119931.

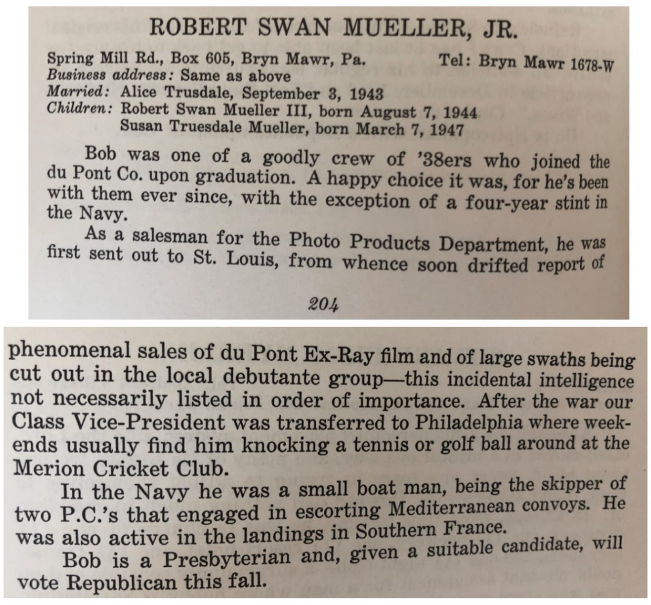
1947 (Nov) -Still a salesman with the X-Ray film division of Du Pont

From the Nov 28 1947 issue of Princeton Alumni Weekly (Pg 23) - *"Bob Mueller had child daughter **Susan Truesdale** on March 7 1947. Bob is a salesman with the X-ray film division of du Pont."'* ([HE000P][GDrive]).

1948 - Princeton 10-yr graduate update

(See full PDF generated from a copy of the book at [HE000Q][GDrive]).



ROBERT SWAN MUELLER, JR.

Spring Mill Rd., Box 605, Bryn Mawr, Pa. Tel: Bryn Mawr 1678-W
Business address: Same as above
Married: Alice Trusdale, September 3, 1943
Children: Robert Swan Mueller III, born August 7, 1944
Susan Truesdale Mueller, born March 7, 1947

Bob was one of a goodly crew of '38ers who joined the du Pont Co. upon graduation. A happy choice it was, for he's been with them ever since, with the exception of a four-year stint in the Navy.

As a salesman for the Photo Products Department, he was first sent out to St. Louis, from whence soon drifted report of

204

phenomenal sales of du Pont Ex-Ray film and of large swaths being cut out in the local debutante group—this incidental intelligence not necessarily listed in order of importance. After the war our Class Vice-President was transferred to Philadelphia where week-ends usually find him knocking a tennis or golf ball around at the Merion Cricket Club.

In the Navy he was a small boat man, being the skipper of two P.C.'s that engaged in escorting Mediterranean convoys. He was also active in the landings in Southern France.

Bob is a Presbyterian and, given a suitable candidate, will vote Republican this fall.

[HE000R][GDrive]

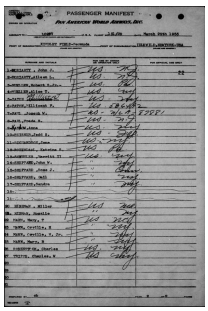
- Address - Spring Mill Rd., Box 605, Bryn Mawr, Pa.
- Joined du Pont Co. upon graduation.
- As a salesman for the Photo Products Department, he was first sent out to St. Louis, from whence soon drifted report of phenomenal sales of du Pont Ex-Ray film and of large swaths being cut out in the local debutante group. .. suggests he did not yet meet Alice when he went to St. Louis

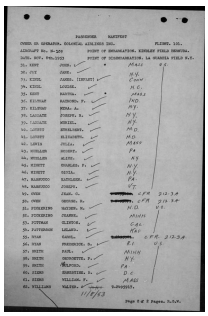
1953 (March) / 1953 (Nov) / 1954 (Oct) - Travel (Vacation) to Bermuda

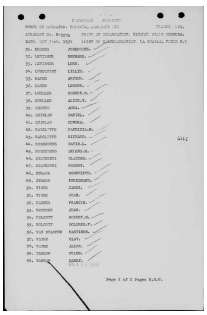
1956 (Nov) - Return from travel to Bermuda

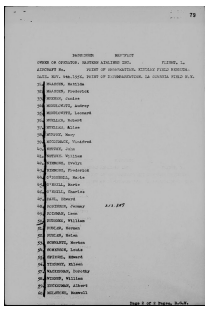
1957(Jan) - Return from travel (vacation) to Bahamas

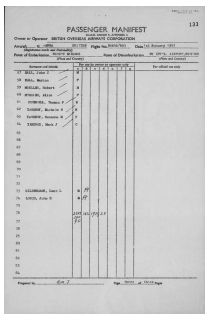
With wife Alice.











1956 (July or August) - Move from Philadelphia to Princeton, New Jersey

*"[**Robert Swan Mueller II**] and his family moved to Princeton in the 1950s so that he could commute to Dupont's New York office.[...] The Muellers lived at 158 Springdale, 120 Winant Road, and 49 Balcort Drive. Young [**Robert Swan Mueller III**] attended Princeton Day School before heading off to St. Paul's School in New Hampshire."* [HW001J][GDrive]. Also see, from Oct 19 1956 Princeton Alumni Review :

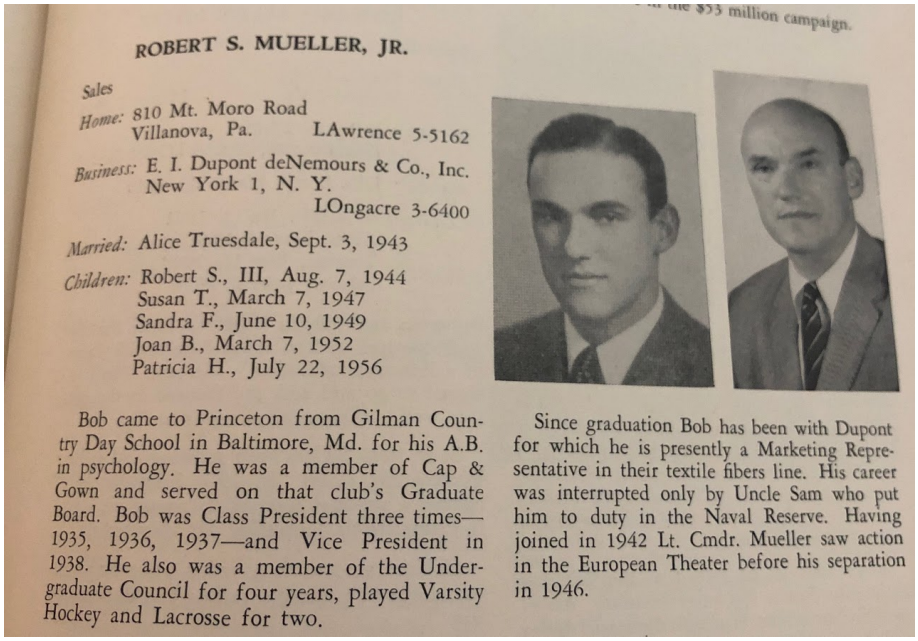
38 FREDERICK C. FIELD JR.
2409 West 17 St., Wilmington 6, Del.
Tel.: WIlmington 2-8240

Here in the fair city of Wilmington our stout '38 contingent has been reduced from a normal of eleven to a mere nine, and as of the date of this issue will be reduced temporarily to eight.

The basic eleven consisted of *Howie Brokaw, Sam Carpenter, Don Cook, Freddy Field, Charlie Freeman, Al Furbeck, Bill Johns, Sam McCune, Ed McLean, Bob Orr* and *Willie Tams*. To this list with a slight stretch could have been added *Bob Mueller* who worked in Wilmington but lived in Philadelphia until a few months ago, when he moved to Princeton.

Princeton Alumni Review, Vol 57
(Oct 19 1956, p29)

1963 - Graduation 25yr Update



the $33 million campaign.

ROBERT S. MUELLER, JR.

Sales

Home: 810 Mt. Moro Road
Villanova, Pa. LAwrence 5-5162

Business: E. I. Dupont deNemours & Co., Inc.
New York 1, N. Y.
LOngacre 3-6400

Married: Alice Truesdale, Sept. 3, 1943

Children: Robert S., III, Aug. 7, 1944
Susan T., March 7, 1947
Sandra F., June 10, 1949
Joan B., March 7, 1952
Patricia H., July 22, 1956

Bob came to Princeton from Gilman Country Day School in Baltimore, Md. for his A.B. in psychology. He was a member of Cap & Gown and served on that club's Graduate Board. Bob was Class President three times—1935, 1936, 1937—and Vice President in 1938. He also was a member of the Undergraduate Council for four years, played Varsity Hockey and Lacrosse for two.

Since graduation Bob has been with Dupont for which he is presently a Marketing Representative in their textile fibers line. His career was interrupted only by Uncle Sam who put him to duty in the Naval Reserve. Having joined in 1942 Lt. Cmdr. Mueller saw action in the European Theater before his separation in 1946.

Robert Swan Mueller II and his family as of 1963 were living at 810 Mt. Moro Road, in **Villanova PA**. This is within diving distance of Philadelphia, ext to **Bryn Mawr**. The home, described by Zillow :*" Built in 1930 under the design talents of Durham and Irvine, Stony Lawn remains one of the Main Line's landmark estate properties. Set on almost three acres and enriched by centennial trees, pool, paddle ball court and warming hut, this 6-7 bedroom, 5 full and 2 1/2 bath home..."*

Purchasers elect Mueller

Robert S. Mueller Jr. of the Du Pont Co. was elected president of the Purchasing Agents Association of Wilmington yesterday.

Mueller succeeds Richard M. Blakeman of the University of Delaware, who was named the association's director of national affairs.

Other officers, whose election was announced at a luncheon meeting in the Hotel du Pont, are Walter L. Cleaver of Hercules, Inc., vice president; Branford P. Hoffman, also of Hercules, treasurer; and M. R. Colletta of the Getty Oil Co., secretary.

All were elected for a one-year term. Cleaver was treasurer last year and Hoffman was secretary.

[HN00DY][GDrive]

1972 (June) - Daughter Susan T. Mueller Married To Louis Timchak Jr.

Full NY Times article - See [HN00GI][GDrive]

Commentary on current job of Robert Swan Mueller II - *"Mrs. Timchak's father is **senior purchasing agent with the E. L du Pont de Nemours & Co. In Wilmington**"*

Miss Susan T. Mueller Married To Louis Timchak Jr., Lawyer

Special to The New York Times

BRYN MAWR, Pa., June 3 — Miss Susan Truesdale Mueller, daughter of Mr. and Mrs. Robert Swan Mueller Jr. of Haverford and Hillock, Warick, Bermuda, was married here this afternoon to Louis John Timchak Jr., son of Mr. and Mrs. Timchak of Johnstown, Pa.

The Rev. Francis X. Metzbower performed the ceremony at the Blessed John Neumann Church here, assisted by Msgr. Patrick J. Ryan, Major General, Chief of Chaplains, U.S.A., retired, and the Rev. Rex F. Clements, retired pastor of the Presbyterian Church in Bryn Mawr.

The bride is executive assistant to the president of the Government Research Company, publishers of The National Journal in Washington. Her husband is a lawyer with the Marriott Corporation in Washington.

Mrs. Timchak's father is senior purchasing agent with the E. I. du Pont de Nemours & Co. in Wilmington, Del.

Mrs. Timchak's father is senpresident of the Laurel Development Company, Latrobe, Pa., real estate developers.

The bride is an alumna of Miss Porter's School in Farmington, Conn., of Bradford Junior College in Massachusetts and received an A.B. Degree from George Washington University in 1970.

Mr. Timchak is a graduate of the Georgetown Preparatory School, of Georgetown University, and of the University of Pittsburgh School of Law. He served as a lieutenant in the Judge Advocate General's Corps, U.S. Naval Reserve from 1965 to 1968 and for 16 months he was on the staff of the Commander, U.S. Naval Support Activity, Danang, Vietnam, as a Judge Advocate and as Foreign Claims Officer.

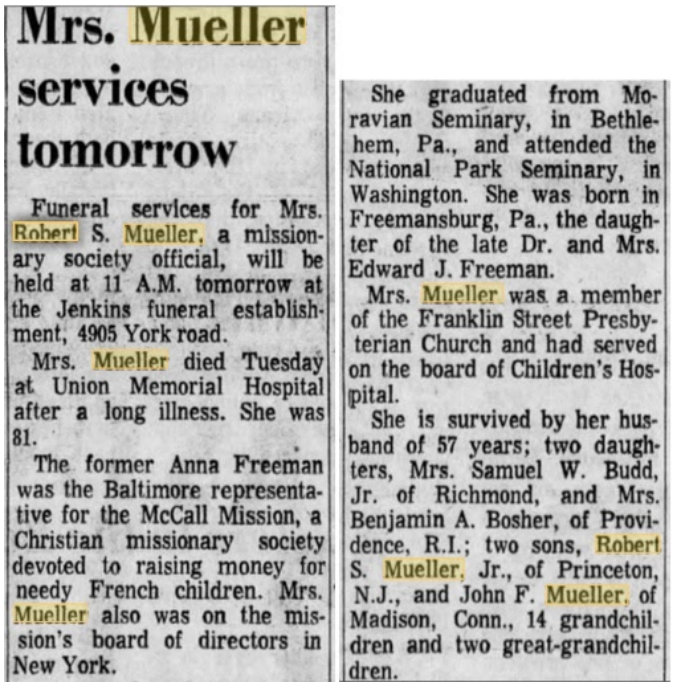
Tom McCaffrey

Mrs. Louis Timchak Jr., was Susan T. Mueller.

[HN00GJ][GDrive]

1973 (May) - Passing of mother Anna Elizabeth Freeman Mueller

Anna Mueller passed on May 8, 1973, at age 81. A news article regarding funeral services can be found below (full page from Baltimore Sun visible here : [HN00DZ][GDrive]).



Mrs. Mueller services tomorrow

Funeral services for Mrs. Robert S. Mueller, a missionary society official, will be held at 11 A.M. tomorrow at the Jenkins funeral establishment, 4905 York road.

Mrs. Mueller died Tuesday at Union Memorial Hospital after a long illness. She was 81.

The former Anna Freeman was the Baltimore representative for the McCall Mission, a Christian missionary society devoted to raising money for needy French children. Mrs. Mueller also was on the mission's board of directors in New York.

She graduated from Moravian Seminary, in Bethlehem, Pa., and attended the National Park Seminary, in Washington. She was born in Freemansburg, Pa., the daughter of the late Dr. and Mrs. Edward J. Freeman.

Mrs. Mueller was a member of the Franklin Street Presbyterian Church and had served on the board of Children's Hospital.

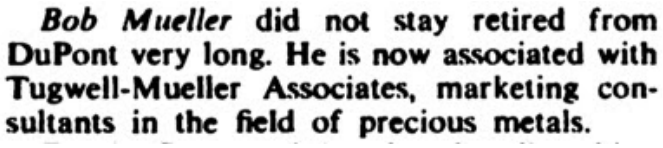
She is survived by her husband of 57 years; two daughters, Mrs. Samuel W. Budd, Jr. of Richmond, and Mrs. Benjamin A. Bosher, of Providence, R.I.; two sons, Robert S. Mueller, Jr., of Princeton, N.J., and John F. Mueller, of Madison, Conn., 14 grandchildren and two great-grandchildren.

[HN00E0][GDrive]

1975 (Jan/Feb) - Recently retired from DuPont, Robert Swan Mueller II launches TMA Inc.

Robert Swan Mueller II worked at **DuPont** for a 35 year career. The Princeton book say he did not stay retired long through, and shortly afterwards started **Tugwell-Mueller Associates Inc.**. We do not know his retirement date, but the Feb 1975 in the Princeton Alumni Review suggests it was late 1974 or early 1975.

(See full issue at [HE000S][GDrive]). TMA Inc. was started in Feb 1975, then Robert Swan Mueller II would have a few months before his 59th birthday.



Bob Mueller **did not stay retired from DuPont very long. He is now associated with Tugwell-Mueller Associates, marketing consultants in the field of precious metals.**

[HE000T][GDrive]

More on **Tugwell-Mueller Associates, Inc. ("TMA, Inc.")**. ... This company was started with **Gilbert Leonard Tugwell (born 1919)** , who was born in Sussex England, but had enjoyed a nearly 40 year career with **Engelhard Corporation** , where he succeeded in 1969 of becoming President of the **Engelhard Industries Division of Engelhard Minerals & Chemicals Corporation** .

1977 (Aug 28) - Wedding - Patricia H Mueller to Henry H Lewis - RSM2 and RSM3 there

The Burlington Free Press (Burlington, Vermont) · 28 Aug 1977, Sun · Page 26

Lewis— Mueller

PRINCETON, N.J. — Patricia H. Mueller, daughter of Mr. and Mrs. Robert S. Mueller Jr., and Henry H. Lewis of Jericho, N.Y., were united in marriage Aug. 20.

Rev. Charles T. Fritsch officiated at the single ring ceremony in the Columbus Boy Choir School.

The bride wore an eyelet lace gown with train.

Joan B. Mueller was maid of honor. Bridesmaids were Polly Lewis, Cynthia Heyer, Cynthia Hoyt, Alice Mauran, Elizabeth Baker and Hanna McCrum.

Best man was Henry Lewis III, the groom's father. Ushers were Gregg Preston, John Nichols, Joe Cacioppo, Jay Dowling, Richard Priem and Robert S. Mueller III.

A reception was held at the Columbus Boy Choir School, following which the couple left for Vermont. They will live in South Burlington, Vt.

Mr. and Mrs. Lewis are students at the University of Vermont.

1946 (November) - John Freeman Mueller working with DuPont while living in Buffalo

Johnnie ***Mueller*** is in Buffalo working in the sales department of duPont. John's engagement to Miss Jermain Johnson of Buffalo was announced August 27; the wedding is set for November 29.

Princeton Alumni Review, Vol 47 (Nov 1 1946, p24)

1948 (September) - Wedding of sister Emilie Grace Mueller to Dr. Samuel Walthall Budd

(See full newspaper page at [HN00FI][GDrive] / clipping at [HN00FJ][GDrive]).

1948 or 1949 - Birth of daughter Jermain Johnson Mueller

She was 70 yrs old as of March 2019 (married in 1976 - see later).

1950 (Jan 27) - Birth of son John Freeman Mueller Jr.

1951 (March 1) - 197x(?) - Career at Reynolds Metals

1950 (March) - Having just left Du Pont in Buffalo NY, John Freeman Mueller joins aluminum window distributor

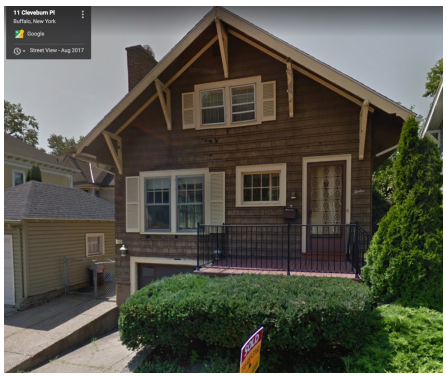
March 1950 - Having just left Du Pont in Buffalo NY, John Freeman Mueller joins aluminum window distributor

"Johnny Mueller says he's settled in Buffalo to stay, having bought a house then at 12 Clevebum Place last October. He resigned from the Du Pont Company the end of the year to accept a position as sales engineer in charge of the aluminum window division of "Alsco" Distributors, Inc. of New York State, where he's associated with Ed Kryder '42. Daughter Jermain, who will be two in March, acquired a baby brother January 27, John F., Jr."

41 H. PHILIPS AUSTIN JR.
4 Griffin Lane
Haverford, Pa.

Princeton Alumni Review, Vol 47 (March 17 1950, p24)

Johnny ***Mueller*** says he's settled in Buffalo to stay, having bought a house there at 12 Cleveburn Place last October. He resigned from the Du Pont Company the end of the year to accept a position as sales engineer in charge of the aluminum window division of "Alsco" Distributors, Inc. of New York State, where he's associated with Ed Kryder '42. Daughter Jermain, who will be two in March, acquired a baby brother January 27, John F., Jr.



March 1963 Princeton Alumni Review - *"**Jack Mueller** has rejoined Reynolds Metals Company, located in N.Y.C. Jack was formerly with Reynolds from 1950 to 1955 in Louisville, Kentucky, and Philadelphia".*

Reynolds Metals had their sales force offices in Louisville Kentucky, but moved them to Richmond Virginia in the (late) 1950s.

*"In June 1958, Reynolds Metals Co. entered a new era in Richmond. Big changes began several years earlier with the transporting of the company's **sales** force from Louisville, Kentucky, to Richmond. This involved moving over 400 employees and their families, 600,000 pounds of office files and equipment and 2,400,000 pounds of employees' household goods almost 600 miles. For several employees this included company-paid visits to Richmond for several months to look for homes in the area"*

See - https://www.richmond.com/from-the-archives/from-the-archives-reynold-metals-richmond-office/article_52ba42fa-0708-11e6-bb2a-a35bf95548fc.html

The other big employer at the time in Louisville Kentucky was Du Pont -

"The 1950s shift from Louisville increased Reynolds's employment in Richmond to 3,050—the largest of any private industrial organization except the Du Pont Co., which had 3,700 (in 1958)."

... Meaning that John Freeman Mueller, working in sales for Du Pont in Buffalo in the late 1940s, might have had some level of continuity if he transitioned to sales with Reynolds Metals in Louisville Kentucky in the early 1950s.

We also read that John F Mueller joined Reynolds Metals "after the way" (See [HL001C][GDrive]), but that is not specific ....

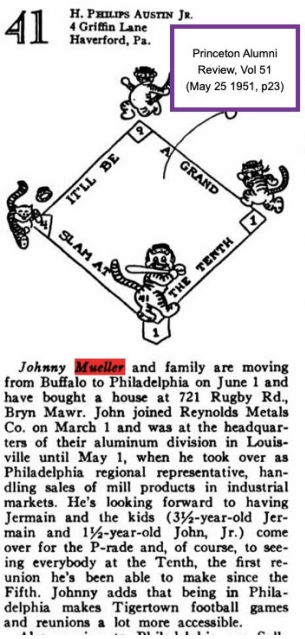
"After the war, Johnnie went into the aluminum-extrusion industry, initially with Reynolds Metals. After his retirement he was still working as a consultant with Indal Extrusion Co. of Gainesville, Ga."

As of April 1969, we know John Freeman Mueller is commuting to Manhattan where is an **"architectural and highway industry manager for Reynolds Metals."**

See WikiPedia articles : https://en.wikipedia.org/wiki/Reynolds_Group_Holdings /

We dont know when John Freeman Mueller retired - But we know "*After his retirement he was still working as a consultant with **Indal Extrusion Co.** of Gainesville, Ga.*" [HL001C][GDrive]

1951 (May) - John Freeman Mueller joins Reynolds Metals on March 1, moved to Bryn Mawr (iow Philadelphia)



41 H. Philips Austin Jr.
4 Griffin Lane
Haverford, Pa.

Princeton Alumni Review, Vol 51 (May 25 1951, p23)

Johnny Mueller and family are moving from Buffalo to Philadelphia on June 1 and have bought a house at 721 Rugby Rd., Bryn Mawr. John joined Reynolds Metals Co. on March 1 and was at the headquarters of their aluminum division in Louisville until May 1, when he took over as Philadelphia regional representative, handling sales of mill products in industrial markets. He's looking forward to having Jermain and the kids (3½-year-old Jermain and 1½-year-old John, Jr.) come over for the P-rade and, of course, to seeing everybody at the Tenth, the first reunion he's been able to make since the Fifth. Johnny adds that being in Philadelphia makes Tigertown football games and reunions a lot more accessible.

1957 (Sep) - Working with the growing New Jersey Aluminum Extrusion Company in New Brunswick, NJ

quite an experience.
John Mueller is with the growing New Jersey Aluminum Extrusion Co., Inc., New Brunswick, N.J., and is associated with Paul H. Metcalf '37, president, and Harold B. Erdman '46, vice-president, both co-founders of the company. The company fabricates custom extrusion and tubing.

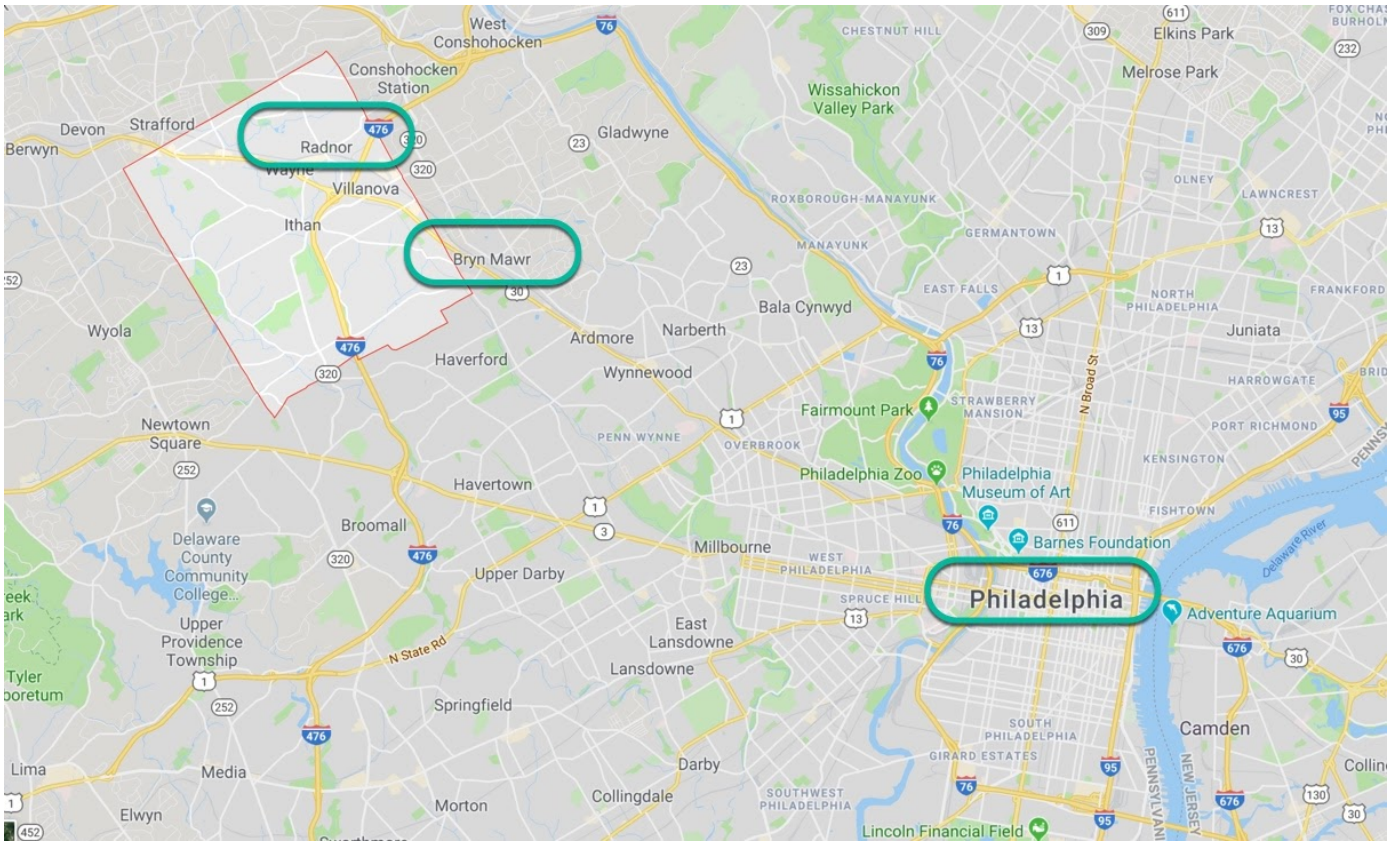
Princeton Alumni Review, Vol 58
(Sep 20 1957, p27)

1957 (Sep) - Selling home in Radnor Pennsylvania , and planning to move to Princeton

Inc., publishers.
John Mueller is moving to Princeton as soon as his home in Radnor, Pa., is sold. He hopes this will be by next spring.

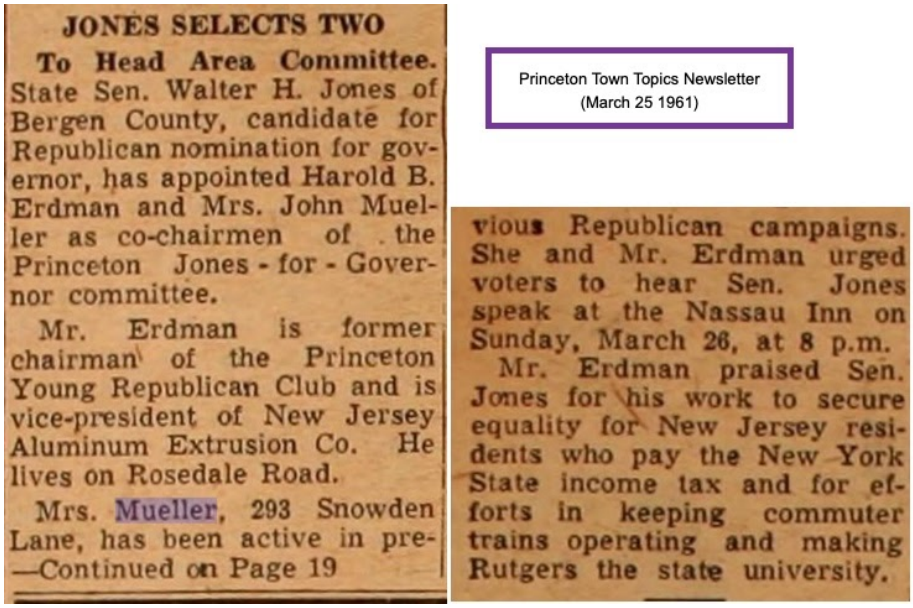
Princeton Alumni Review, Vol 58
(Sep 27 1957, p24)

Where is Radnor?



1961 - Residing at 293 Snowden Lane / Working for NJ Republican governor campaigns

Full doc - [HN00GE][GDrive]



JONES SELECTS TWO

To Head Area Committee.

State Sen. Walter H. Jones of Bergen County, candidate for Republican nomination for governor, has appointed Harold B. Erdman and Mrs. John Mueller as co-chairmen of the Princeton Jones - for - Governor committee.

Mr. Erdman is former chairman of the Princeton Young Republican Club and is vice-president of New Jersey Aluminum Extrusion Co. He lives on Rosedale Road.

Mrs. Mueller, 293 Snowden Lane, has been active in pre-

—Continued on Page 19

vious Republican campaigns. She and Mr. Erdman urged voters to hear Sen. Jones speak at the Nassau Inn on Sunday, March 26, at 8 p.m.

Mr. Erdman praised Sen. Jones for his work to secure equality for New Jersey residents who pay the New York State income tax and for efforts in keeping commuter trains operating and making Rutgers the state university.

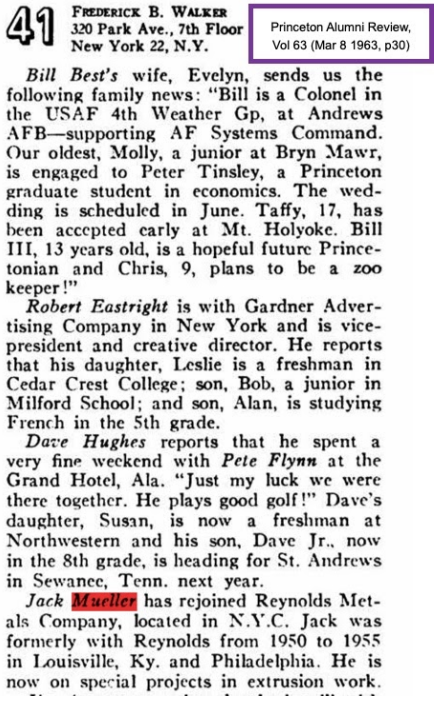
1963 (March) - Rejoins Reynolds Metals Company in NYC



41 FREDERICK B. WALKER
320 Park Ave., 7th Floor
New York 22, N.Y.

Princeton Alumni Review,
Vol 63 (Mar 8 1963, p30)

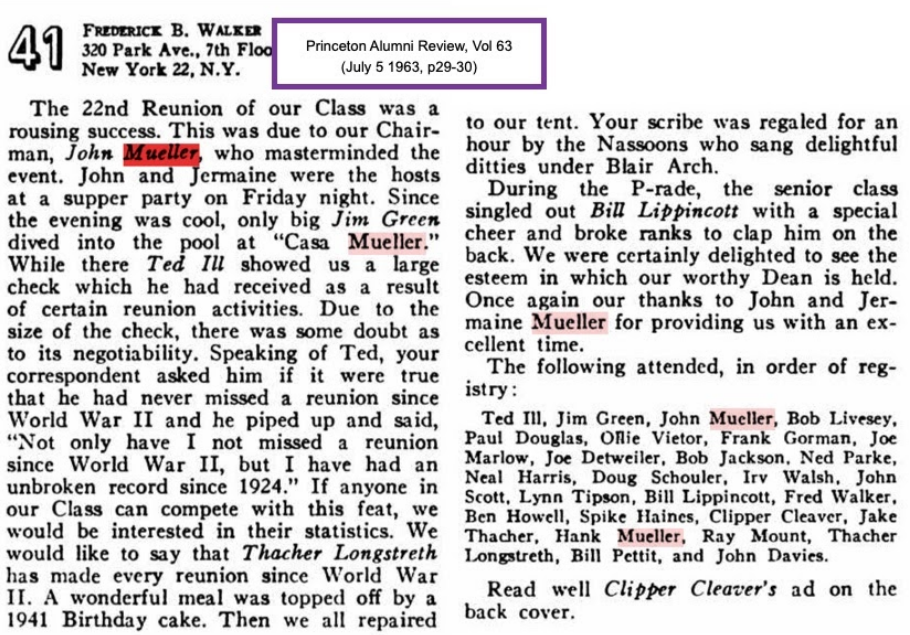
Bill Best's wife, Evelyn, sends us the following family news: "Bill is a Colonel in the USAF 4th Weather Gp, at Andrews AFB—supporting AF Systems Command. Our oldest, Molly, a junior at Bryn Mawr, is engaged to Peter Tinsley, a Princeton graduate student in economics. The wedding is scheduled in June. Taffy, 17, has been accepted early at Mt. Holyoke. Bill III, 13 years old, is a hopeful future Princetonian and Chris, 9, plans to be a zoo keeper!"

Robert Eastright is with Gardner Advertising Company in New York and is vice-president and creative director. He reports that his daughter, Leslie is a freshman in Cedar Crest College; son, Bob, a junior in Milford School; and son, Alan, is studying French in the 5th grade.

Dave Hughes reports that he spent a very fine weekend with *Pete Flynn* at the Grand Hotel, Ala. "Just my luck we were there together. He plays good golf!" Dave's daughter, Susan, is now a freshman at Northwestern and his son, Dave Jr., now in the 8th grade, is heading for St. Andrews in Sewanee, Tenn. next year.

Jack Mueller has rejoined Reynolds Metals Company, located in N.Y.C. Jack was formerly with Reynolds from 1950 to 1955 in Louisville, Ky. and Philadelphia. He is now on special projects in extrusion work.

1963 (July) - 22nd Princeton reunion for Class of 1941



41 FREDERICK B. WALKER
320 Park Ave., 7th Floo
New York 22, N.Y.

Princeton Alumni Review, Vol 63
(July 5 1963, p29-30)

The 22nd Reunion of our Class was a rousing success. This was due to our Chairman, *John Mueller*, who masterminded the event. John and Jermaine were the hosts at a supper party on Friday night. Since the evening was cool, only big *Jim Green* dived into the pool at "Casa Mueller." While there *Ted Ill* showed us a large check which he had received as a result of certain reunion activities. Due to the size of the check, there was some doubt as to its negotiability. Speaking of Ted, your correspondent asked him if it were true that he had never missed a reunion since World War II and he piped up and said, "Not only have I not missed a reunion since World War II, but I have had an unbroken record since 1924." If anyone in our Class can compete with this feat, we would be interested in their statistics. We would like to say that *Thacher Longstreth* has made every reunion since World War II. A wonderful meal was topped off by a 1941 Birthday cake. Then we all repaired to our tent. Your scribe was regaled for an hour by the Nassoons who sang delightful ditties under Blair Arch.

During the P-rade, the senior class singled out *Bill Lippincott* with a special cheer and broke ranks to clap him on the back. We were certainly delighted to see the esteem in which our worthy Dean is held. Once again our thanks to John and Jermaine Mueller for providing us with an excellent time.

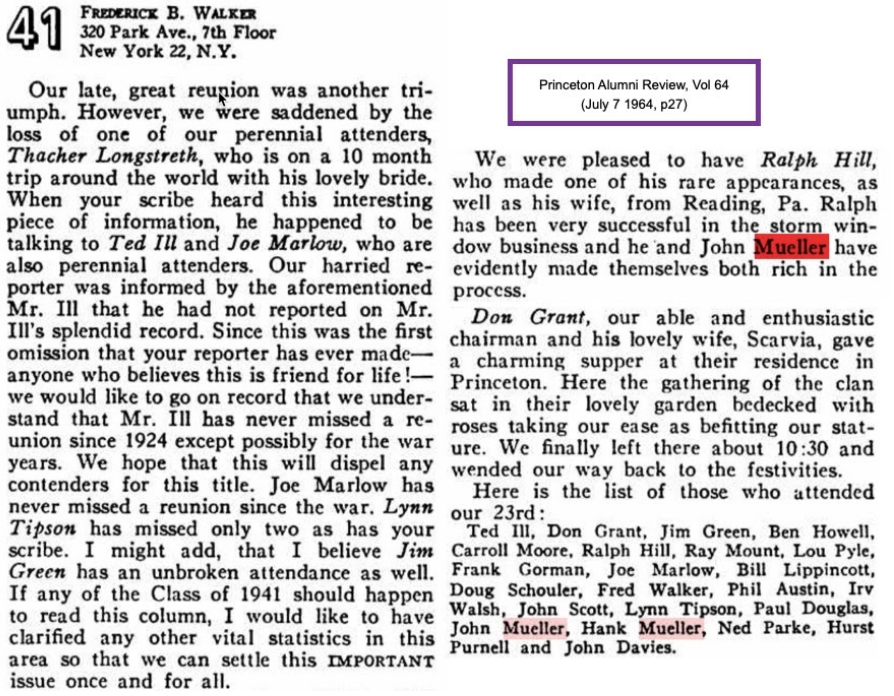
The following attended, in order of registry:

Ted Ill, Jim Green, John Mueller, Bob Livesey, Paul Douglas, Ollie Vietor, Frank Gorman, Joe Marlow, Joe Detweiler, Bob Jackson, Ned Parke, Neal Harris, Doug Schouler, Irv Walsh, John Scott, Lynn Tipson, Bill Lippincott, Fred Walker, Ben Howell, Spike Haines, Clipper Cleaver, Jake Thacher, Hank Mueller, Ray Mount, Thacher Longstreth, Bill Pettit, and John Davies.

Read well *Clipper Cleaver's* ad on the back cover.

1964 (July)

John Freeman Mueller - has made good money with storm windows?



41 FREDERICK B. WALKER
320 Park Ave., 7th Floor
New York 22, N.Y.

Princeton Alumni Review, Vol 64
(July 7 1964, p27)

Our late, great reunion was another triumph. However, we were saddened by the loss of one of our perennial attenders, *Thacher Longstreth*, who is on a 10 month trip around the world with his lovely bride. When your scribe heard this interesting piece of information, he happened to be talking to *Ted Ill* and *Joe Marlow*, who are also perennial attenders. Our harried reporter was informed by the aforementioned Mr. Ill that he had not reported on Mr. Ill's splendid record. Since this was the first omission that your reporter has ever made—anyone who believes this is friend for life!—we would like to go on record that we understand that Mr. Ill has never missed a reunion since 1924 except possibly for the war years. We hope that this will dispel any contenders for this title. Joe Marlow has never missed a reunion since the war. *Lynn Tipson* has missed only two as has your scribe. I might add, that I believe *Jim Green* has an unbroken attendance as well. If any of the Class of 1941 should happen to read this column, I would like to have clarified any other vital statistics in this area so that we can settle this IMPORTANT issue once and for all.

We were pleased to have *Ralph Hill*, who made one of his rare appearances, as well as his wife, from Reading, Pa. Ralph has been very successful in the storm window business and he and John Mueller have evidently made themselves both rich in the process.

Don Grant, our able and enthusiastic chairman and his lovely wife, Scarvia, gave a charming supper at their residence in Princeton. Here the gathering of the clan sat in their lovely garden bedecked with roses taking our ease as befitting our stature. We finally left there about 10:30 and wended our way back to the festivities.

Here is the list of those who attended our 23rd:

Ted Ill, Don Grant, Jim Green, Ben Howell, Carroll Moore, Ralph Hill, Ray Mount, Lou Pyle, Frank Gorman, Joe Marlow, Bill Lippincott, Doug Schouler, Fred Walker, Phil Austin, Irv Walsh, John Scott, Lynn Tipson, Paul Douglas, John Mueller, Hank Mueller, Ned Parke, Hurst Purnell and John Davies.

1967 (Mach 31) - Marriage to " Ellen Michele Girard"

Per divorce certificate.

1967 (April 22) - Ex-wife Mrs. Jermain (Johnson) Mueller remarries to Jack F Andrews of Lawrenceville

The first wife of John Freeman Mueller is from now on sometimes referred to as "**Mrs. Jack Frost Andrews**".

See https://alldokument.com/town-topics-princeton-apr-27-1967.html - The below clip is from March 22 2019 -

,

Mrs. Jermain Johnson Mueller of Princeton, daughter of Mr. and Mrs. George F. B. Johnson of Buffalo. N. Y., to Jack F. An-

drews

of Lawrenceville; Saturday, April 22. The bride is a graduate of the Bouve Boston School of Physical Education. Mr. Andrews, son of Mrs. Horace St. John Andrews of Kew Gardens, N. Y., and the late Mr. Andrews, is a graduate of

Massachusetts Institute of Technology and New York '

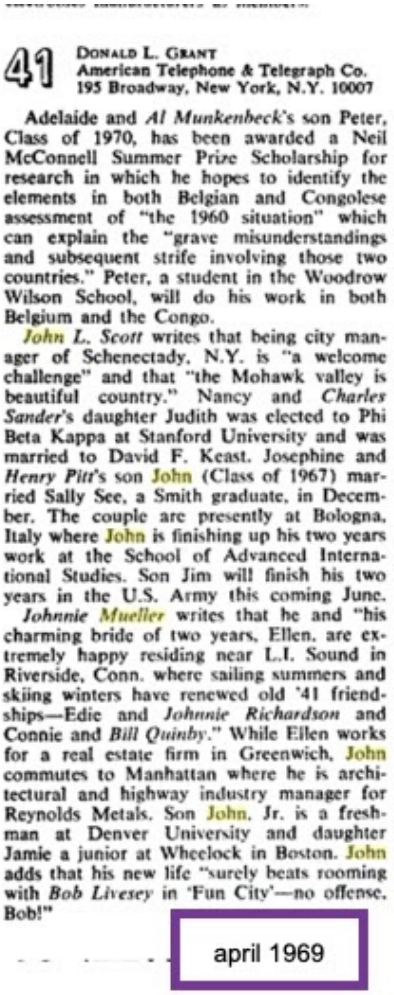
University. The couple will live Lane. Cleveland at 70-A

Princeton. It's

New To Us

1969 (April) - Update

- John Freeman Mueller has been married for two years now - to Ellen Mueller.
- Research Note - Due to James Girard Swan Mueller being half Italian, we suspect Ellen Mueller is full-Italian. We are not sure if she herself was born in Italy or not.
- As of April 1969, John and Ellen are residing in Riverside, Connecticut on Long Island Sound
- John Freeman Mueller is commuting to Manhattan where is an **"architectural and highway industry manager for Reynolds Metals."**
- We learn of a son (with his first wife), John Freeman Mueller Jr. who is a freshman in Denver (meaning he was born in the early 1950s)



41 DONALD L. GRANT
American Telephone & Telegraph Co.
195 Broadway, New York, N.Y. 10007

Adelaide and *Al Munkenbeck*'s son Peter, Class of 1970, has been awarded a Neil McConnell Summer Prize Scholarship for research in which he hopes to identify the elements in both Belgian and Congolese assessment of "the 1960 situation" which can explain the "grave misunderstandings and subsequent strife involving those two countries." Peter, a student in the Woodrow Wilson School, will do his work in both Belgium and the Congo.

John L. Scott writes that being city manager of Schenectady, N.Y. is "a welcome challenge" and that "the Mohawk valley is beautiful country." Nancy and *Charles Sander*'s daughter Judith was elected to Phi Beta Kappa at Stanford University and was married to David F. Keast. Josephine and *Henry Pitt*'s son John (Class of 1967) married Sally See, a Smith graduate, in December. The couple are presently at Bologna, Italy where John is finishing up his two years work at the School of Advanced International Studies. Son Jim will finish his two years in the U.S. Army this coming June.

Johnnie Mueller writes that he and "his charming bride of two years, Ellen, are extremely happy residing near L.I. Sound in Riverside, Conn. where sailing summers and skiing winters have renewed old '41 friendships—Edie and *Johnnie Richardson* and Connie and *Bill Quinby*." While Ellen works for a real estate firm in Greenwich, John commutes to Manhattan where he is architectural and highway industry manager for Reynolds Metals. Son John, Jr. is a freshman at Denver University and daughter Jamie a junior at Wheelock in Boston. John adds that his new life "surely beats rooming with *Bob Livesey* in 'Fun City'—no offense, Bob!"

april 1969

1969 (July) - Verification of being in marketing with Reynolds Metals

Bill Quimby "had a pleasant cocktail hour at my house on March 2nd with two classmates": *John Mueller* and *Doug McAvity*. John, as noted recently in PAW, is in marketing with Reynolds Metals. Doug moved recently to Greenwich with his family from Birmingham, Alabama. Doug is treasurer of the Eastern Division, U.S. Steel. According to Bill, "the argument of steel vs. aluminum was settled by the second martini!"

Princeton Alumni Review, Vol 69 (July 1 1969, p31)

1971 (April) - Michele Girard Mueller born / Now living in Stamford Connecticut

april 1971

41 DONALD L. GRANT
A.T.&T., 195 Broadway
New York, N.Y. 10007

OUR 30TH!
JUNE 3-5

Have you sent in your application?

From Ellen & *John Mueller* we received the good news that Michele Girard Mueller arrived on Feb. 17—our first entry for the 1971 Class Progeny Award! John also informs us that the Muellers now reside at 164 Van Rensselaer Ave., Stamford, Conn. 06902, where they have more room for "Missy" and are closer to Long Island Sound. Our congratulations to Ellen & John.

We've done it again! Our Class, led by *John Scott*, contributed $191,621 to Annual Giving. This ranks us 3rd among all classes, with only the 50th and 25th Reunion classes exceeding our totals. Furthermore, *Win Short* spurred the drive as AG Chairman for the University to a fine total of over $3.1 million.

Jim Armstrong wrote the memorial of *Bob Johnson*, which appears in this issue of the WEEKLY.

1973 (Sep) - Birth of son James Girard Swan Mueller

John Freeman Mueller's son **James Girard Swan Mueller** was born on Sep 1973 in New Haven, Connecticut, USA.

His mothers family is from Biella, Italy. Girard is derived from the Italian name **"Gilardino"**.

Grew up in New Haven and Greenwich, Connecticut, Baltimore, Maryland and Richmond, Charlottesville and Waynesboro, Virginia.

As of today (2019), he is a Hollywood actor whose name goes by **"Girard Swan"**. See his latest biography on IMDB (captured March 2019) at [HW001I] [GDrive] .

1976 (April) - Still yachting to Gibson Island

The Islander Sloop SHASSEUR .

41 CHARLES N. BARTON
233 Broadway, Suite 1275
New York, N.Y. 10007

As of March 12 we had 74 paid acceptances for reunions. That's a good start! Here are the additions since the last list: *Chuck Waugh*; *Beas Williamson*; *F. S. Harris*; *Bob Brokaw*; *Thorpe Goodfellow*; *Jake Thacher*; *Dana Knowlton*; *Dave Hughes*; *Ward Reighley*; *George Richardson*; *Bonny Bonnyman*; *Red Stewart*; *Walt McCarthy*; *Art Rice*; *Mac McCandlish*; *Bill Rich*; *Sam Folger*; *Bob Walker*; *Wes Janney*; *Tommy Tomlinson*; *Chuck Rounds*; *Bill Bausch*; *Jack Cornwell*; *Tom Fortune*; *John Scott*; *John Richardson*; *Bob McCullam*; *Brud Smith*; *Bill Smart*; *Ross Woolsey*; *Warren Broadbent*; *Irish Maguire* and *Les Rice*. Between this and previous listings you can see who of your closer friends are already coming back—Come join them! "Crew Call"—from *Johnny Mueller* "to '41 classmates before going through Corinthians. Need two handy (& lucky) seamen to help sail his newly owned 34′ Islander Sloop SHASSEUR from Gibson Island Yacht Club, Md. Tuesday, April 25th, to Stanford Yacht Club, Saturday, April 30th." It's a wonderful trip (I've done it so I know), a perfect time to do it, and the boat is beautiful and completely equipped even down to cushions in orange and black with the Beer Suit design on them. Call Johnny quickly (203) 421-4321. Incidentally Johnny is still representing Reynolds Metals in Conn. and R.I., but has rejoined the U.S. Naval Reserve in New Haven and is teaching weekends and using his boat for it. Now that's not all dumb!

Princeton Alumni Review, Vol 76 (April 19 1976, p28)

1976 (Oct) - Wedding of daughter Jermain Johnson Mueller to Eric Randall Steiner

(See full page in newspaper at [HN00GG][GDrive]) . Note that "**Mrs. Jack Frost Andrews**" is actually **Mrs. Jermain Duncan (Johnson) Mueller** , the first wife of John Freeman Mueller ; She remarried April 22 1967.

Steiner - Mueller

Married Saturday in Nassau Presbyterian Church, Princeton, N. J., were Jermain Johnson Mueller and Eric Randall Steiner.

The bride is the daughter of Mrs. Jack Frost Andrews, Lawrenceville, N. J. and John Freeman Mueller, Madison, Conn. The bridegroom is the son of Mr. and Mrs. Theodore Otis Steiner, 4155 W. Bath Rd.

In the wedding party were: Mrs. Bruce Williams, Terry O. Steiner and Thomas W. Hess.

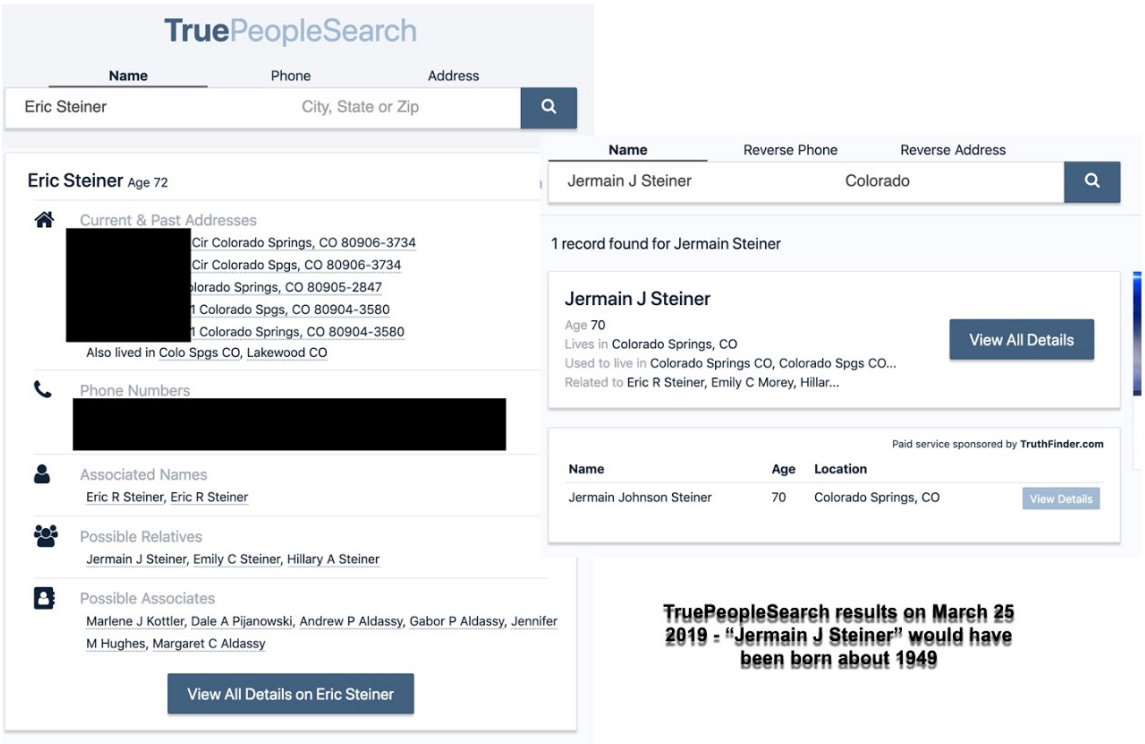
The bride is a graduate of the Wheelock College, Boston, Mass., and is employed by Jefferson County Public Schools, Littleton, Colo. Her bridegroom is a graduate of Ohio University and Ohio State University Law School. He is employed by Amax, Inc., Golden, Colo.

The couple plans a honeymoon to Canada.

MRS. STEINER
. . . Jermain Johnson Mueller

[HN00GH][GDrive]

At some point, she moved to Colorado Springs, Colorado. See below capture, from (https://www.truepeoplesearch.com/) .



TruePeopleSearch results on March 25 2019 - "Jermain J Steiner" would have been born about 1949

1977 (Nov) - Retirement from Reynolds Metals

Got a note from *John* ***Mueller***. After 27 years in the aluminum business he took early retirement from Reynolds Metals. Sold his house and boat in Connecticut and moved home—Baltimore area! He immediately went in a service business, where he has no more manufacturing headaches. He's now a professional counselor with Eastern Employment Service in Baltimore and lives in Crafton, Md., near Annapolis and Chesapeake Bay, which means sailing!

Princeton Alumni Review, Vol 78 (Nov 21 1977, p34)

1978 (Oct) - Joins Carolina Aluminum Company

41 CHARLES N. BARTON
John F. Curry Agency
225 Broadway, NYC 10007

Howie Ziegler has retired from the National Security Agency after 36 years of doing what he can't tell. He's moving to Scotland, where he says the living is easier.

A note from *Irv Walsh* recounts his busy life with real estate in the San Pedro, Ca., area. He's in residential, income, and buying-and-fixing-for-sale-themselves real estate. He's on the board of the local hospital.

After retiring from Reynolds Aluminum last year, *Johnny* ***Mueller*** moved to Maryland and went right back to his old industry as sales service manager of Carolina Aluminum Company. When you're visiting wonderful Williamsburg, Va., look him up.

Princeton Alumni Review, Vol 79 (Oct 09 1978, p42)

1979 (Nov) - Sales and service manager for Easco Aluminum in Winton, NC

Princeton Alumni Review, Vol 80 (Nov 19 1979, p29)

Got a long note from *Johnny Mueller*. He tried retirement after 27 years with Reynolds Metals—for one year. Decided it was for the kids and that he liked the aluminum industry after all, so he is back in it as sales service manager of Easco Aluminum in Winton, N.C. I quote: "The work is so challenging and rewarding I'll never retire again!" He likes living in Franklin, Va., just 30 minutes from his plant, and being home every night.

1980 (June) - Starts second career with Aluminum Extrusion & Tubing

Princeton Alumni Review, Vol 80 (June 30 1980, p29)

Johnny Mueller has just started a second career with Aluminum Extrusion & Tubing sales, covering Delaware, Maryland, Virginia, and North Carolina from his base in Richmond. He spent two years in the North Carolina plant preparing for this after retiring from Reynolds Metals.

1986 Divorce (Nov)

Separated since at least a year before.

Now we know Ellen Michele Girard was her name

Maybe it was "Ellen Michele **"Gilardino"**. ?

Robert Swan Mueller III (born 1944)

Wikipedia Robert Swan Mueller III

Intro

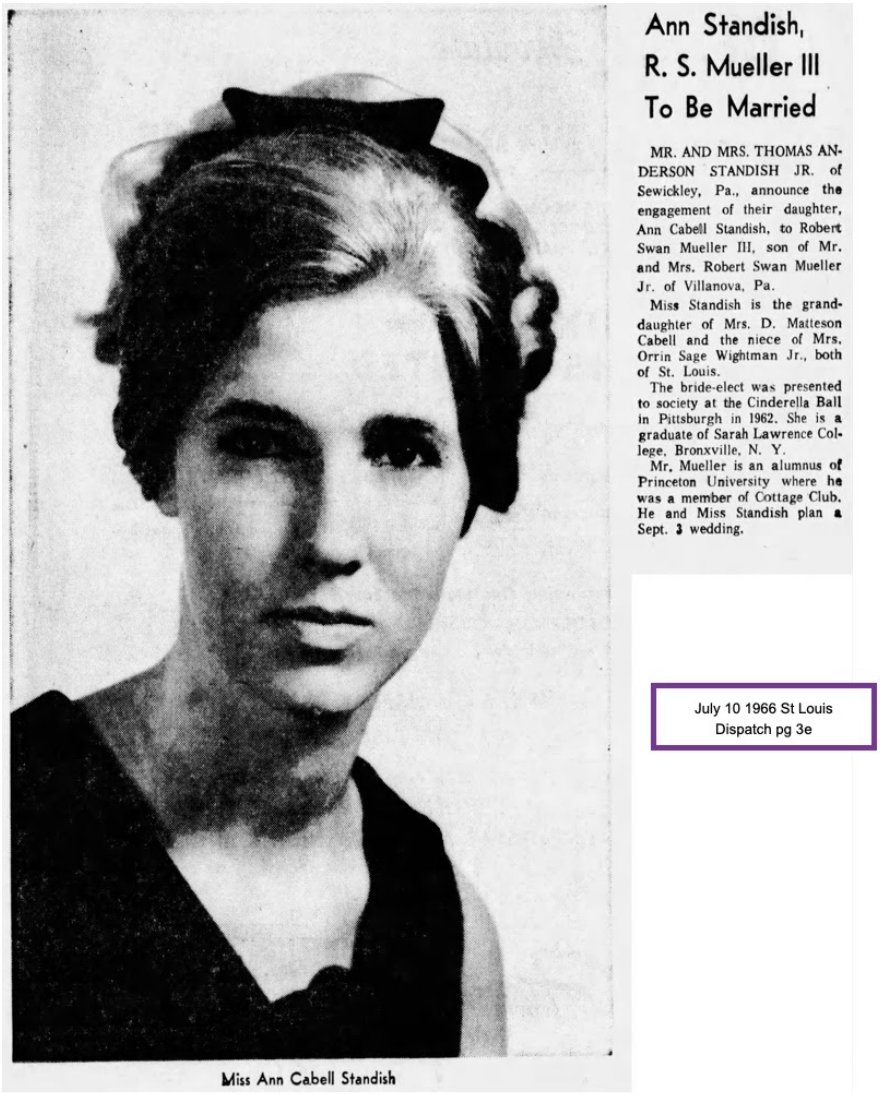
Robert Swan Mueller III was born born on August 7, 1944. The birth took place at Doctors Hospital in the New York City borough of Manhattan; his father Robert Swan Mueller II (born 1916) was residing in NYC and with the the US Navy at the time.

Robert Swan Mueller III is the nephew of John Freeman Mueller (born 1919) .

Robert Swan Mueller III is the grandson of of Robert Swan Mueller I (b1893) .

1966 - Engages Ann Standish

Full page : [HN00E8][GDrive]



Ann Standish, R. S. Mueller III To Be Married

MR. AND MRS. THOMAS ANDERSON STANDISH JR. of Sewickley, Pa., announce the engagement of their daughter, Ann Cabell Standish, to Robert Swan Mueller III, son of Mr. and Mrs. Robert Swan Mueller Jr. of Villanova, Pa.

Miss Standish is the granddaughter of Mrs. D. Matteson Cabell and the niece of Mrs. Orrin Sage Wightman Jr., both of St. Louis.

The bride-elect was presented to society at the Cinderella Ball in Pittsburgh in 1962. She is a graduate of Sarah Lawrence College, Bronxville, N. Y.

Mr. Mueller is an alumnus of Princeton University where he was a member of Cottage Club. He and Miss Standish plan a Sept. 3 wedding.

Miss Ann Cabell Standish

Above - From FOIA request [aa31][GDrive]

Some of the initialisms :

- **FMF** = "Fleet Marine Force"
- **OCS** = Officer Candidates School (see https://en.wikipedia.org/wiki/Officer_Candidates_School_(United_States_Marine_Corps))
- **MCB** = "Marine Corps. Base, Quantico" (see https://en.wikipedia.org/wiki/Marine_Corps_Base_Quantico)
- **OIC** = "Officer in Charge"
- **VCB** = "Vandegrift Combat Base"

1966 - Graduates from Princeton - Enlists in Marine Corps, but first studies International Relations at New York University (to allow a leg injury to heal)

"Just a few weeks after he finished Princeton with a degree in politics in 1966, Mueller enlisted in the Marine Corps, a rare choice for an Ivy League graduate at a time when many young men were casting about for ways to avoid the draft. Mueller, who declined to be interviewed for this article, has often said he was inspired to join the Marines by his lacrosse teammate David Hackett, who had graduated from Princeton a year earlier and gone off to fight in Vietnam." [aa21][GDrive]

Robert Swan Mueller III was on inactive duty from Aug 30 1966 to November 19 1967 (As shown in [aa29][GDrive] .

*"Before beginning his military training, and **while recovering from a knee injury**, [before starting at Officer Candidates School], Mueller studied international relations at **New York University**"* [aa21][GDrive]

1967 (spring?) - Earns a Master of Arts in international relations from New York University

See 🔵 Robert Swan Mueller III

1967 (Nov 20) - 1968 (July 15) - Officer Candidates School (OCS) at Quantico Virginia

8 months

"[After] recovering from a knee injury [while studying] at New York University [, Robert S Mueller III then starts] Officer Candidates School at Quantico, Va., where he excelled, although he did get a D in delegation." [aa21][GDrive]

"[In full, Mueller attended] training at Parris Island, Officer Candidate School, Army Ranger School, and Army jump school. Of these, he said later that he considered Ranger School the most valuable because he felt "more than anything teaches you about how you react with no sleep and nothing to eat." [aa39][GDrive]

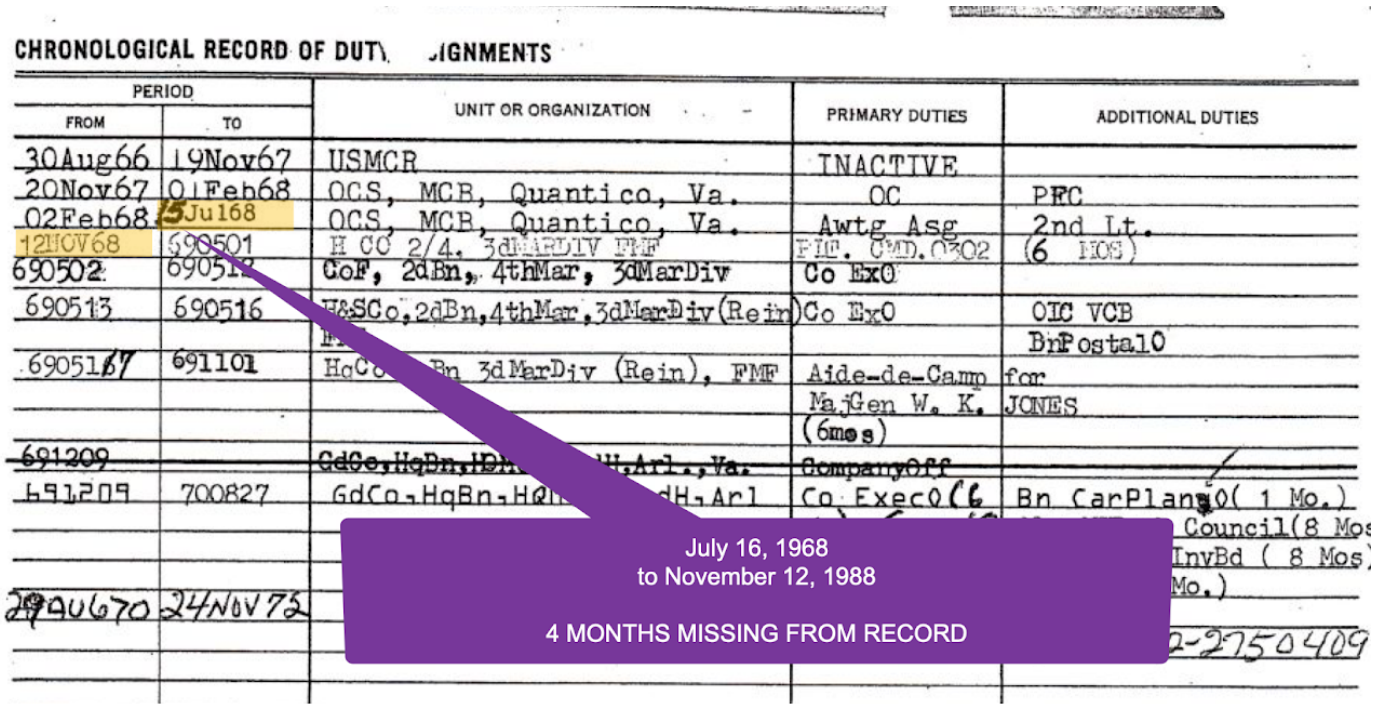
"[The] Army's Ranger School [is a highly regarded by grueling] course for combat leadership[.] The assignments are unusual for Marines and, typically, set aside for just a handful of the best each year." [aa9][GDrive]

"[This] unusual training for a Marine [also signaled that he was going places." [aa21][GDrive]

*"In 2004, the **Army's Ranger Hall of Fame** inducted Mueller [See https://ranger.org/Resources/Documents/RHOF%20Master%20List%20(05-24-2013).pdf]. The shrine recognizes Rangers who have distinguished themselves among their peers, as well as Ranger School alumni like Mueller who did not serve in a Ranger unit, but graduated from Ranger School and distinguished themselves in other ways. [...] The hall credited Mueller with leading the FBI "through the dramatic transformation required in the aftermath of the September 11th terrorist attacks." It cited his continued leadership in transforming the bureau into a modern counter-terrorism agency."* [aa9][GDrive]

1968 (July 15) - 1968 (Nov 11)

4 months missing from record. Where was Robert Swan Mueller III ?



1968 (Nov 12) - 1969 (May 1) Active Duty, Vietnam

*"When Robert Swan Mueller III deployed to Vietnam as a Marine infantry platoon commander in 1968, he surely knew it would be difficult. Mueller's regiment, the 4th Marines, had faced bloody jungle warfare for months, and Mueller joined in them [...] at th**e tail end** of what military historians say was the service's defining year in the war due to the size and scope of their operations."* [aa9][GDrive]

These several book chapters well document activities in Vietnam, 1968, September thru December.

1. "Book - US Marines in Vietnam - The Defining Year : 1968", Chapters 17-20 : [aa22][GDrive]
2. "Book - US Marines in Vietnam - The Defining Year : 1968", Chapters 21 and 22 (includes December 1968) : [aa23][GDrive]

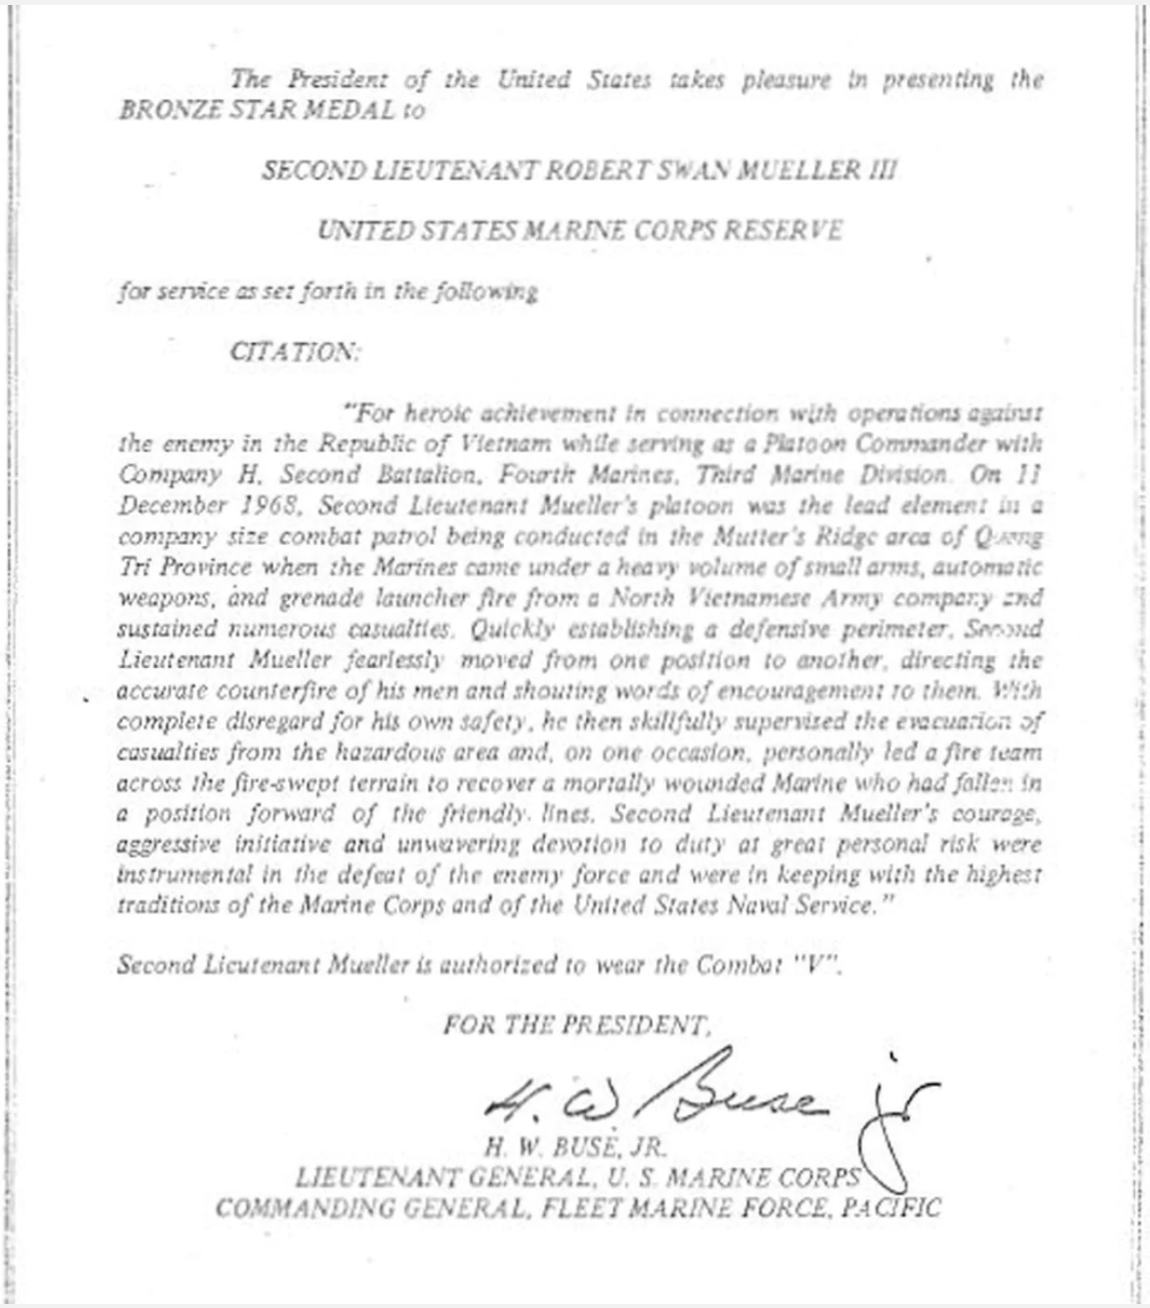
*"In combat, Mueller was a member of H Company, 2nd Battalion, 4th Marines, an infantry unit assigned along dangerous **Mutter's Ridge**. It was a section of **Quang Tri province** that overlooked the Vietnamese Demilitarized Zone that separated North Vietnam and South Vietnam."* [aa9][GDrive]

How bad was the war in September of 1968? Here are References :

1. 25 American's were killed at Mutter's Ridge in one day alone on Sep 16 1968 - https://www.newspapers.com/image/434375045/?terms=vietnam%2Bmutter%2Bridge
2. Sep 19 - https://www.newspapers.com/image/154671960/?terms=vietnam%2Bmutter%2Bridge

"Mueller's unit was decorated for two battles outlined in media accounts[.] In the first, he led Marines through an eight-hour battle near Mutter's Ridge in which the his men faced fire from small arms and automatic weapons, as well as a grenade launcher. Mueller, then a second lieutenant, moved among Marine positions in the

battle, directing counter-fire and setting up a defensive perimeter and then supervising the evacuation of wounded Marines, including one who died. For his actions, Mueller would receive the Bronze Star with "V" device and this citation: (n award citation detailing then 2nd Lt. Robert S. Mueller III's valor in Vietnam in December 1968.)" [aa9][GDrive]



The President of the United States takes pleasure in presenting the BRONZE STAR MEDAL to

SECOND LIEUTENANT ROBERT SWAN MUELLER III

UNITED STATES MARINE CORPS RESERVE

for service as set forth in the following

CITATION:

"For heroic achievement in connection with operations against the enemy in the Republic of Vietnam while serving as a Platoon Commander with Company H, Second Battalion, Fourth Marines, Third Marine Division. On 11 December 1968, Second Lieutenant Mueller's platoon was the lead element in a company size combat patrol being conducted in the Mutter's Ridge area of Quang Tri Province when the Marines came under a heavy volume of small arms, automatic weapons, and grenade launcher fire from a North Vietnamese Army company and sustained numerous casualties. Quickly establishing a defensive perimeter, Second Lieutenant Mueller fearlessly moved from one position to another, directing the accurate counterfire of his men and shouting words of encouragement to them. With complete disregard for his own safety, he then skillfully supervised the evacuation of casualties from the hazardous area and, on one occasion, personally led a fire team across the fire-swept terrain to recover a mortally wounded Marine who had fallen in a position forward of the friendly lines. Second Lieutenant Mueller's courage, aggressive initiative and unwavering devotion to duty at great personal risk were instrumental in the defeat of the enemy force and were in keeping with the highest traditions of the Marine Corps and of the United States Naval Service."

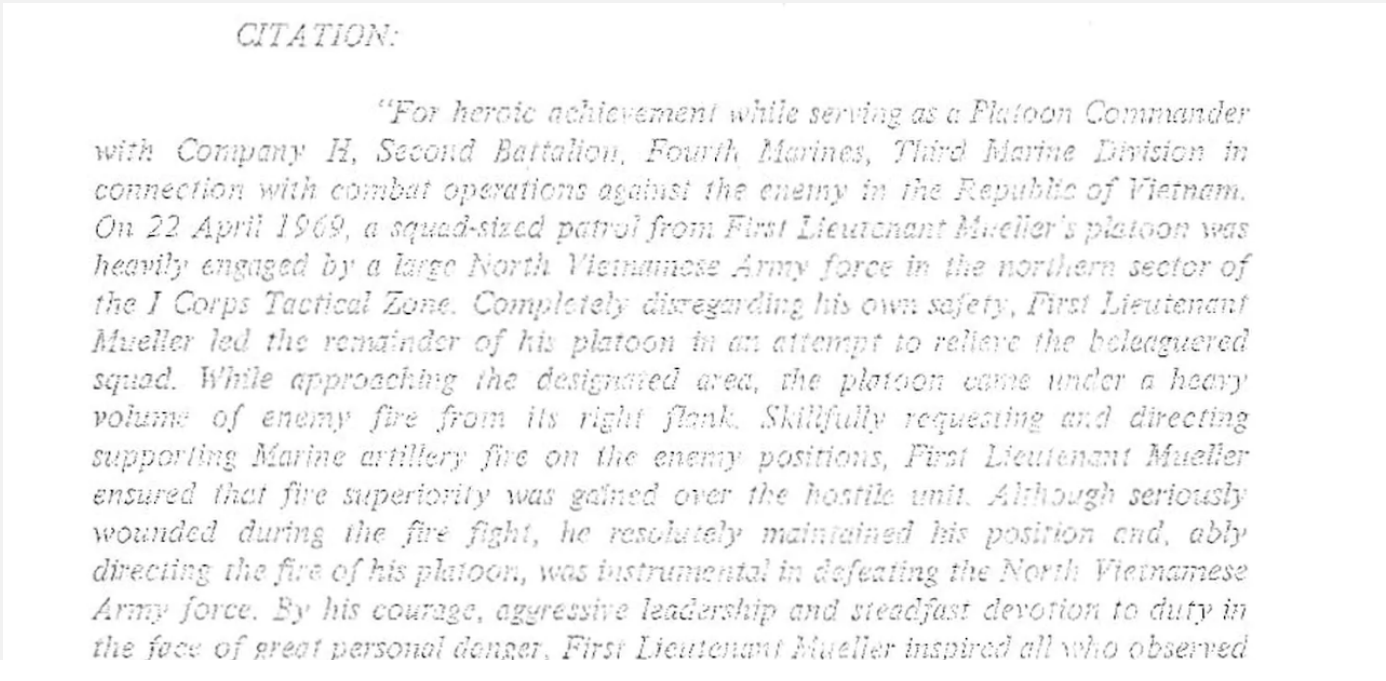
Second Lieutenant Mueller is authorized to wear the Combat "V".

FOR THE PRESIDENT,

H. W. Buse Jr.

H. W. BUSE, JR.
LIEUTENANT GENERAL, U. S. MARINE CORPS
COMMANDING GENERAL, FLEET MARINE FORCE, PACIFIC

Four months later [in April 1969], Mueller was shot in the thigh responding to the ambush of some of the Marines under his command. A description of his actions from the Navy Commendation Medal with "V" that he received: [A Navy Commendation Medal with "V" citation describes Robert S. Mueller III's actions the day he was wounded in Vietnam. }



CITATION:

"For heroic achievement while serving as a Platoon Commander with Company H, Second Battalion, Fourth Marines, Third Marine Division in connection with combat operations against the enemy in the Republic of Vietnam. On 22 April 1969, a squad-sized patrol from First Lieutenant Mueller's platoon was heavily engaged by a large North Vietnamese Army force in the northern sector of the I Corps Tactical Zone. Completely disregarding his own safety, First Lieutenant Mueller led the remainder of his platoon in an attempt to relieve the beleaguered squad. While approaching the designated area, the platoon came under a heavy volume of enemy fire from its right flank. Skillfully requesting and directing supporting Marine artillery fire on the enemy positions, First Lieutenant Mueller ensured that fire superiority was gained over the hostile unit. Although seriously wounded during the fire fight, he resolutely maintained his position and, ably directing the fire of his platoon, was instrumental in defeating the North Vietnamese Army force. By his courage, aggressive leadership and steadfast devotion to duty in the face of great personal danger, First Lieutenant Mueller inspired all who observed

him and uphold the finest traditions of the Marine Corps and of the United States Naval Service."

BACKGROUND - Lt. General Henry W Buse Jr

See 🔵 Lt. General Henry William Buse Jr. : "*At the beginning of July 1967, **Buse** was appointed chief of staff, Headquarters Marine Corps. [This] assignment lasted until May 31, 1968, when he received the Navy Distinguished Service Medal for his service in this capacity, and was then transferred to Hawaii.*" In April 1968 **Lt. Gen Buse Jr.** was appointed Commanding General Fleet Marine Force Pacific, in charge of all Marine units in the Pacific. See article clip below; full page at [aa36][GDrive] .

See 🔵 Lt. General Henry William Buse Jr. : "*[In Vietnam, **General Buse**] frequently visited the combat zone in Vietnam and always moved immediately to forward areas to assess operational requirements, investigate problem areas, and encourage and assist his Marines in every way possible. Under Lieutenant General Buse's dynamic leadership, Marine infantry units were reorganized into well-coordinated, mobile elements, **the command's electronic warfare operational capability increased to a degree unparalleled in Marine aviation history,** and numerous major amphibious operations were planned and executed with tremendous success.*"

🔵 Lt. General Henry William Buse Jr. was relieved by 🔵 Lt. General William Kenefick Jones on July 1, 1970, and subsequently retired from the military service. He distinguished himself in his last assignment and received his second Navy Distinguished Service Medal.

- NOTE : W K Jones is person whom Robert Swan Mueller III was an Aide-de-Camp to from 1969 (May 19) to 1969 (Nov 01)

"***General Buse** was the authorizing authority on [all of] Mueller's awards.*" [**From "The Mule: Robert Swan Mueller III" by Gene "Chip" Tatum**]

Passed-Over General Asks To Be Retired

WASHINGTON (AP) —A senior Marine general whose star rose under former Secretary of Defense Robert S. McNamara has put in for retirement.

He is Lt. Gen. Victor H. Krulak, passed over for Marine commandant and considered a leading contender for two other top posts until they were filled earlier this month by others.

The White House said President Johnson is nominating Krulak for permanent rank of lieutenant general when he retires about June 1.

For the last four years, Krulak has commanded Fleet Marine Forces in the Pacific with headquarters in Honolulu.

Krulak, 55, came to McNamara's attention while serving as a specialist on counterinsurgency under the Joint Chiefs of Staff.

It was reported President John F. Kennedy also was impressed with Krulak, who is credited with a major role in developing clear-and-hold tactics used by the Marines in Vietnam until major North Vietnamese incursions changed the character of the war.

Although Krulak was considered at one time the leading contender for Marine commandant, Johnson chose Gen. Leonard F. Chapman Jr. last December.

Johnson made his announcement five days after McNamara's intention to leave the Pentagon was made public. Krulak reportedly was McNamara's first choice.

In subsequent months, sources said Krulak was a leading candidate to become commander in chief of all Pacific forces—a job that would have meant promotion to full general. He also was mentioned as possible deputy to the U.S. commander in Vietnam, also a four star post.

But on April 10 Johnson named Adm. John S. McCain Jr. to become commander in chief of the Pacific and Army Gen. Andrew Goodpaster for the deputy position in Saigon.

Krulak, a native of Denver, Colo. is said by some sources to be planning to retire to San Diego, Calif.

The Pentagon said his successor as commanding general of Pacific Fleet Marine Froces will be Lt. Gen. Henry W. Buse, 56, a native of Ridley Park, Pa. Buse now is chief of staff at Marine headquarters.

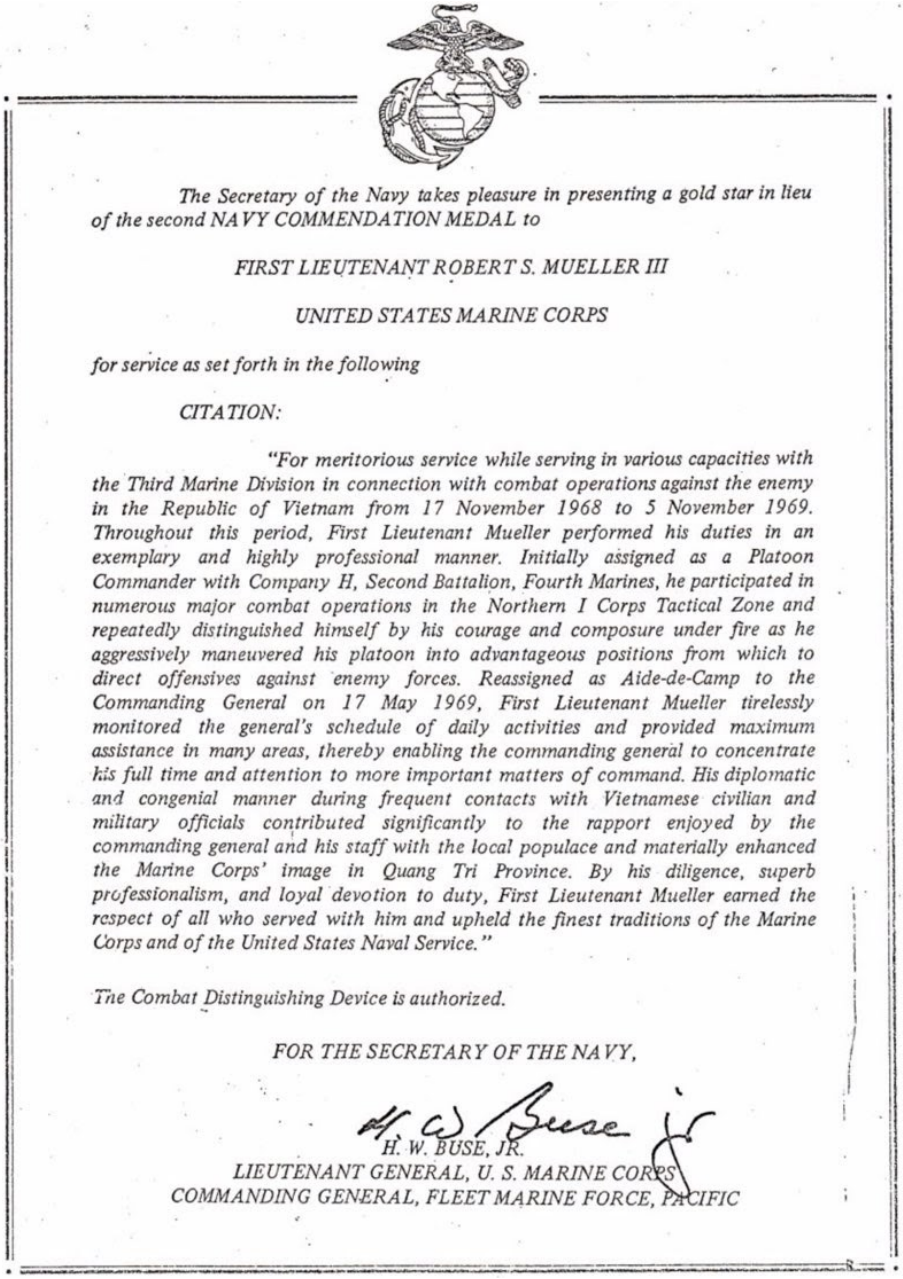
See From "The Mule: Robert Swan Mueller III" by Gene "Chip" Tatum :

During {Mueller's] time in Vietnam and as an assistant to the General [W. K. Jones] he gained the attention of a number of top government officials including the future CIA Director, ***William Colby*** *and future Deputy Director of covert Operations for the CIA* ***Ted Shackley****. Unknown to Mueller at the time, the path for his future was set by being included in "The List". The List is a highly classified and never released document passed on from DCI to DCI of trusted operators and their area of expertise. If asked about this document the DCI ["Director of Central Intelligence"] will claim absolute deniability of its existence.*

Note that Gen Buse wrote ANOTHER letter of recommendation (see below, **From "The Mule: Robert Swan Mueller III" by Gene "Chip" Tatum**) for Robert Swan Mueller III for a Gold Star, after his months as Aide-de-Camp to Major General W. K. Jones , for being "professional" and "diplomatic". The number of letters feels to be exceptionally high for one person. Was Buse tasked with ensuring a successful record was documented for Robert Swan Mueller III ?



The Secretary of the Navy takes pleasure in presenting a gold star in lieu of the second NAVY COMMENDATION MEDAL to

FIRST LIEUTENANT ROBERT S. MUELLER III

UNITED STATES MARINE CORPS

for service as set forth in the following

CITATION:

"For meritorious service while serving in various capacities with the Third Marine Division in connection with combat operations against the enemy in the Republic of Vietnam from 17 November 1968 to 5 November 1969. Throughout this period, First Lieutenant Mueller performed his duties in an exemplary and highly professional manner. Initially assigned as a Platoon Commander with Company H, Second Battalion, Fourth Marines, he participated in numerous major combat operations in the Northern I Corps Tactical Zone and repeatedly distinguished himself by his courage and composure under fire as he aggressively maneuvered his platoon into advantageous positions from which to direct offensives against enemy forces. Reassigned as Aide-de-Camp to the Commanding General on 17 May 1969, First Lieutenant Mueller tirelessly monitored the general's schedule of daily activities and provided maximum assistance in many areas, thereby enabling the commanding general to concentrate his full time and attention to more important matters of command. His diplomatic and congenial manner during frequent contacts with Vietnamese civilian and military officials contributed significantly to the rapport enjoyed by the commanding general and his staff with the local populace and materially enhanced the Marine Corps' image in Quang Tri Province. By his diligence, superb professionalism, and loyal devotion to duty, First Lieutenant Mueller earned the respect of all who served with him and upheld the finest traditions of the Marine Corps and of the United States Naval Service."

The Combat Distinguishing Device is authorized.

FOR THE SECRETARY OF THE NAVY,

H. W. BUSE, JR.
LIEUTENANT GENERAL, U. S. MARINE CORPS
COMMANDING GENERAL, FLEET MARINE FORCE, PACIFIC

20xx-us-military-foia-response-robert-s-mueller-3-us-marine-corp-service-clip-2.jpg / https://drive.google.com/open?id=1CjGM-DmaLCX3Mn7LrcZIk0lr3KwBYiLQ

🔵 **United States 3rd Marine Division**

"During the 1968 Tet Offensive, the division conducted operations along the DMZ with a portion of the division fighting in the Battle of Huế. The operational tempo increased with the initiation of the Tet Offensive in late January 1968. At the time, 3rd Marine Division intelligence estimated the combat strength of PAVN and Viet Cong (VC) forces in the DMZ area was 40,943 troops.[15] The PAVN and VC stepped up their attacks by fire on every combat base in the division area of operations. This included daily attempts at interdiction of naval traffic on the Cua Viet River near Đông Hà. The division had to invest many of its assets to open the Cua Viet River to traffic. BLT 5/I, the Landing Force of SLF B, remained under the operational control (OPCON) of the division throughout February 1968. BLT 3/I continued Operation Saline under operational control of the 1st Amphibian Tractor Battalion with the mission of clearing the area adjacent to the Cua Viet River between Cua Viet and Đông Hà. BLT 2nd Battalion, 4th Marines, the Landing Force of SLF A, remained under operational control of the division throughout the month. BLT 2/4 conducted operations in the Lancaster II and Kentucky areas.

During the Vietnam War, the 3rd Marine Division suffered 6,869 men killed in action.

The division departed South Vietnam in November 1969 with more than 20 Marines having received the Medal of Honor and moved to Camp Courtney, Okinawa, where it is presently located."

[aa9][GDrive]

"Mueller [...] healed [from his war wounds in Vietnam] and then became an aide to a senior officer, Jones, who was a towering figure in the Marines. Jones had earned a Silver Star and Navy Cross for valor as a battalion commander during the World War II battles of Tarawa and Saipan, respectively, and went on to become a regimental commander in the Korean War.

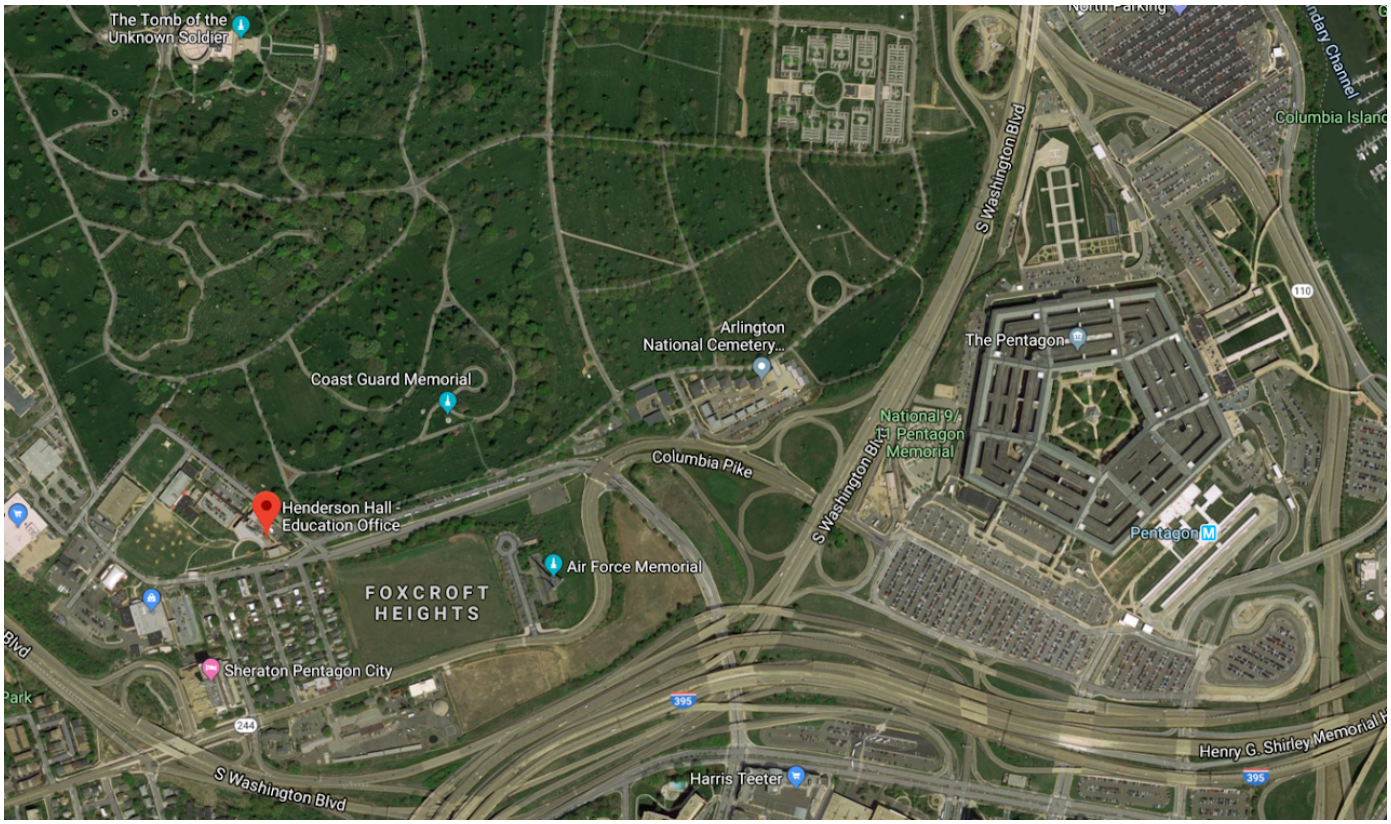
Jones regarded Mueller well, said retired Marine Gen. James L. Jones, who was William Jones's nephew. The younger Jones did not know Mueller during the Vietnam War, but he learned about Mueller's past service to the elder Jones in former president Barack Obama's White House, where Mueller was the FBI director and the younger Jones was his first national security adviser."

1969 (Dec 09) - 1970 (August) - At Henderson Hall (in Arlington Virginia)

See From "The Mule: Robert Swan Mueller III" by Gene "Chip" Tatum :

After returning from Vietnam, Mueller was briefly stationed at Henderson Hall in Arlington, Virginia where he would be debriefed by Military and CIA personnel before leaving active-duty service in August 1970.

Note : **Henderson Hall** (https://en.wikipedia.org/wiki/Henderson_Hall_(Arlington,_Virginia)) is a Marine Corps installation that is immediately next to the Pentagon - See the images below. Robert Swan Mueller III was so impressive in combat that he almost went directly into the Pentagon.



1969 (December) to 1970 (Jan 23)- At Henderson, Assistant Recorder of Officer Screening Board

A01G-glm-1
23 JAN 1970

From: President, Temporary Officer Screening Board
To: First Lieutenant Robert S. MUELLER III, 010 56 00/ 0302, United States Marine Corps Reserve
Via: Commanding Officer, Headquarters Battalion, Headquarters United States Marine Corps, Henderson Hall, Arlington, Virginia 22214

Subj: Letter of Appreciation

1. From 15 December 1969 to 16 January 1970 you were assigned as the Assistant Recorder of the Temporary Officer Screening Board convened at Headquarters Marine Corps. Your duties required that you make all preparations for the convening of the board, arranging for suitable facilities for the board, for the drawing from Officer Records Branch over 3,300 temporary officer records, for orderlies, rosters and other administrative necessities, and for security of the records under study by the board.

2. Although understandably unfamiliar with selection board matters and Headquarters Marine Corps organization and given but limited guidance you demonstrated outstanding initiative and exceptionally fine professional competance in rapidly accomplishing a myriad of details so that the board could convene on time.

3. During the deliberations of the board it was your responsibility to apportion to the board members an equivalent work load so that the board could effeciently and expeditiously review and brief the cases submitted to it for consideration. In addition it was your duty to maintain precise records of the proceeding of the board as well as continual changing statistical data employed by the board. Your devotion to duty, long hours of application, cheerful cooperation, interest, enthusiasm, good judgement and sound recommendations regarding procedures were invaluable in the accomplishment of the boards mission. Throughout your assignment as Assistant Recorder you conducted yourself in a highly professional manner and demonstrated a truly impressive growth potential as an officer in the Marine Corps.

Background : Nugan Hand Bank (up to 1976)

See From "The Mule: Robert Swan Mueller III" by Gene "Chip" Tatum :

*In 1973 **Frank Nugan**, an Australian lawyer, and **Michael Hand**, a former CIA contract operative, established the Nugan Hand Bank. Another key figure in this venture was Bernie Houghton, who was closely connected to CIA officials, Ted Shackley and Thomas G. Clines*

Nugan ran operations in Sydney whereas Hand established a branch in Hong Kong. This enabled Australian depositors to access a money-laundering facility for illegal transfers of Australian money to Hong Kong. According to Alfred W. McCoy, the "Hand-Houghton partnership led the bank's international division into new fields drug finance, arms trading, and support work for CIA covert operations." Hand told friends "it was his ambition that Nugan Hand became banker for the CIA."

In 1974 the Nugan Hand Bank got involved in helping the CIA to take part in covert arms deals with contacts within Angola. It was at this time that Edwin Wilson became involved with the bank. Two CIA agents based in Indonesia, James Hawes and Robert Moore, called on Wilson at his World Marine offices to discuss "an African arms deal". Later, Bernie Houghton arrived from Sydney to place an order for 10 million rounds of ammunition and 3,000 weapons including machine guns. The following year Houghton asked Wilson to arrange for World Marine to purchase a high-technology spy ship. This ship was then sold to Iran.

*By 1976 the Nugan-Hand Bank appeared to have become a CIA-fronted company. This is reflected in the type of people recruited to hold senior positions in the bank. For example, Rear-Admiral E**arl P. Yates**, the former Chief of Staff for Policy and Plans of the U.S. Pacific Command and a counter-insurgency specialist, became president of the company. Other appointments included William Colby, retired director of the CIA, General Leroy J. Manor, the former chief of staff of the U.S. Pacific Command and deputy director for counterinsurgency and special activities, General Edwin F. Black, former commander of U.S. forces in Thailand, Walter J. McDonald, retired CIA deputy director for economic research, Dale C. Holmgren, former chairman of the CIA's Civil Air Transport and Guy J. Pauker, senior Republican foreign policy adviser.*

One of those that Earl P. Yates brought in to help the Nugan Hand Bank was Mitchell WerBell. Yates later told the Joint Task Force on Drug Trafficking he recruited WerBell as a consultant because he "had extensive experience in Central America". Former CIA agent, Kevin P. Mulcahy later told the National Times newspaper "about the Agency's use of Nugan Hand for shifting money for various covert operations around the globe."

[aa10][GDrive]

*It is interesting to note that **Jones** served as Director of the Combat Operations Center Military Assistance Command Vietnam (MACV) in Saigon. His boss was **General William C. Westmorland**.*

On July 1, 1970, Lt. General Jones assumed his last duty assignment as Commanding General, Fleet Marine Force, Pacific, when he relieved Lt General Henry W. Buse Jr. and served in this capacity until his retirement from active duty on September 1, 1972.

[....]

As an established officer known within the command and having been recruited by the Phoenix Program, Mueller quickly moved up the proverbial ladder. He would find that those contacts made as a young Lieutenant would prove valuable in civilian life.

[...]

Nugan Hand Bank [1976 - on]

[aa11][GDrive]

[...]

The investigative journalist, Jonathan Kwitny, became convinced that the Nugan Hand Bank had replaced the Castle Bank and Trust Company in Nassau, as the CIA's covert banker. The bank, run by Paul Helliwell, was forced to close after the Internal Revenue Service discovered that he Castle Bank was laundering CIA funds and drug profits.

On 27th November 1979 Michael Hand wrote to Ted Shackley. It concerned a meeting the two men had recently attended in Washington: "The opportunity of meeting you again on different terms was very enjoyable and I sincerely trust that something worthwhile businesswise may surface and be profitable for both of us."

In the winter of 1979, Edwin Wilson had a meeting with Bernie Houghton and Thomas G. Clines in Switzerland in an attempt to help him out of his difficulties. This included a non-delivery of 5,000 M16 automatic rifles. The three men discussed ways of using the Nugan Hand Bank to float a $22 million loan to finance the delivery. Hand was obviously concerned that if Wilson was arrested he might begin talking about his dealings with Nugan Hand.

On 7th January 1980, Robert Wilson (House of Representatives Armed Services Committee) and Richard Ichord (chairman of the Research and Development Subcommittee of the Armed Services Committee) had dinner with Bernie Houghton at the Bourbon and Beefsteak Bar and Restaurant in Sydney.

On 27th January, 1980, Frank Nugan was found shot dead in his Mercedes Benz. With his body was a Bible that included a piece of paper. On it were written the names "Bob Wilson" and "Bill Colby". Robert Wilson was a senior member of the U.S. House of Representatives Armed Services Committee and William Colby was a former director of the CIA.

Bernie Houghton was in Switzerland at the time and he immediately rang his branch office in Saudi Arabia and ordered the staff to leave the country. Houghton also visited Edwin Wilson's office in Geneva and left a briefcase with bank documents for safekeeping. Soon afterwards, a witness saw Thomas G. Clines going through the briefcase at Wilson's office and remove papers that referred to him and General Richard Secord.

Two days after Nugan died, Michael Hand held a meeting of Nugan Hand Bank directors. He warned them that unless they did as they were told they could "finish up with concrete shoes" and would be "liable to find their wives being delivered to them in pieces".

Michael Hand, Patricia Swan, Bernie Houghton and his lawyer, Mike Moloney, spent the next few days removing files from Nugan's office. They also began paying back selected clients. One estimate is that over $1.3 million was paid out in this way.

Frank Nugan's inquest took place in April, 1980. Testimony from Michael Hand revealed that Nugan Hand was insolvent, owing at least $50 million. Hand then promptly fled Australia under a false identity on a flight to Fiji in June 1980. Bernie Houghton also disappeared at this time and it is believed both men eventually reached the United States.

According to one witness, Thomas G. Clines helped Bernie Houghton escape. Michael Hand also left the country accompanied by James Oswald Spencer, a man who served with Ted Shackley in Laos. The two men traveled to America via Fiji and Vancouver. One report published in November, 1980, suggested that Michael Hand was living in South America. It claimed that he had managed to escape with the help of "former CIA employees".

The Australian government asked the Royal Commissioner D. G. Stewart to investigate the Nugan-Hand Bank scandal. Stewart contacted the U.S. Department of Justice requesting full cooperation. The U.S. Attorney assigned to the case was "The Mule"

The Stewart Royal Commission was published in June, 1985. It stated that the "Nugan Hand Ltd. was at all times insolvent... and flouted the provisions of the legislation as it then stood in that large volumes of currency were moved in and out of Australia".

Stewart went on to blame the dead Frank Nugan and the missing Michael Hand for the illegal activities of the bank. Rear-Admiral Earl P. Yates, William Colby, General Leroy J. Manor, General Edwin F. Black, Walter J. McDonald, Dale C. Holmgren, Guy J. Pauker and Bernie Houghton were considered blameless. Despite the evidence, Hand and Patricia Swan, Nugan's secretary, were accused of being the only ones "responsible for the shredding of documents".

The Mule

Russian Connection

In 1980 Pillsbury Madison & Sutro lawyers helped make financial history when they were hired by Genentech in that company's bid to go public. Founded in 1976 by a professor at the University of California at San Francisco Medical Center, Genentech pioneered the new field of genetic engineering or biotechnology when it showed that gene-splicing was commercially viable. Pillsbury Madison & Sutro represented Blyth Eastman Paine Webber Inc., a New York investment banking firm and the main underwriter of Genentech in its initial public offering. That IPO, in just one minute, sold one million shares of common stock for $35 million, the fastest public offering in history at the time. The Genentech IPO marked Pillsbury Madison and Sutro's entry into one of the major growth industries of the late 20th century, and the firm would go on to represent such high-tech companies as LSI Logic Corporation and others. To support high-tech firms interested in investing in Russia, Pillsbury Madison in 1989 chaired a group of advisors of the first Soviet-American venture capital fund. It was imperative that the U.S. Attorney's office recommend to Washington the need for entry into the Soviet Financial Marketplace. The man for that job was a former CIA asset placed in the Department of Justice. He was referred to as "The MULE" Robert S. Mueller III.

The Take Down

Backtracking a bit Mueller achieved the position of assistant U.S. attorney for the District of Northern California in 1976, rising to chief of its criminal division in 1981. Mueller then became assistant U.S. attorney for the District of Massachusetts in 1982, and served as the district's acting attorney from 1986 to '87.

But none of this is news. His climb up the ladder was swift. As the demand for his special skills increased, he was moved in and out of the U.S. Attorney's office to major law firms. This is called the revolving door. The CIA normally uses this tactic with their assets and operatives.

In 1987 Mueller was repositioned to the Boston firm of Hill and Barlow. It is there that he convinced a major department to resign from the firm and in favor of an international firm aligned with various Governments' This action caused bankruptcy and closure of the firm, sending messages to other firms to align or face the same fate.

Mission complete "The Mule" was once again called on to lend a helping hand to the U.S. Attorney's office.

How to Silence Threats

For many years, Panama's General Manuel Noriega was the embodiment of the terms "military strongman" and "de facto leader".

Although he was never the actual president of Panama, he was the key figure from 1983 to 1989 and a key US ally and CIA Asset in Central America for four decades.

His connection with the United States dated back to the 1950s, when according to various accounts, he was recruited as a CIA informant while studying at a military academy in Peru.

Noriega eventually became a prized American "asset" in a region that was becoming politically hostile to US interests in the wake of the Cuban Revolution.

He rose within the ranks of the Panamanian armed forces to become a key supporter of Gen Omar Torrijos, the military ruler who signed a treaty with the US to restore the Panama Canal zone to Panamanian sovereignty in 1977.

After Gen Torrijos's death in a mysterious plane crash in 1981, Noriega became the power behind the scenes as head of the security services.

The US relied on Panama as a regional listening post and Noriega obliged with unfaltering support for the Contras in Nicaragua, and in the fight against the FMLN guerrillas in El Salvador.

Officials in the Reagan Administration and past Administrations said in interviews that they had overlooked General Noriega's illegal activities because of his cooperation with American intelligence and his willingness to permit the American military extensive leeway to operate in Panama.

They said, for example, that General Noriega had been a valuable asset to Washington in countering insurgencies in Central America and was now cooperating with the Central Intelligence Agency in providing sensitive information from Nicaragua.

Noriega played a role in the mid-1980s Iran-Contra affair, which involved the smuggling of weapons and drugs to aid US undercover efforts to support the anti-government forces opposing the Sandinistas in Nicaragua through a group of companies called the Enterprise..

Proceeds from the Enterprise were laundered through several U.S. and offshore banks.

However, the Enterprise became increasingly suspicious of Noriega amid indications that he was skimming proceeds from the sale of weapons and drugs.

Although a congressional investigation revealed that the Reagan Administration was unaware of the illicit activities, documents released show that Reagan's vice president, George H.W. Bush was in the loop and overseeing "The Enterprise" Operations.

Flight plans released from pilots and U.S. military aircraft operating in Honduras in support of the Nicaraguan Contras show direct involvement of Vice President Bush and other U.S. Officials in the South American operations.

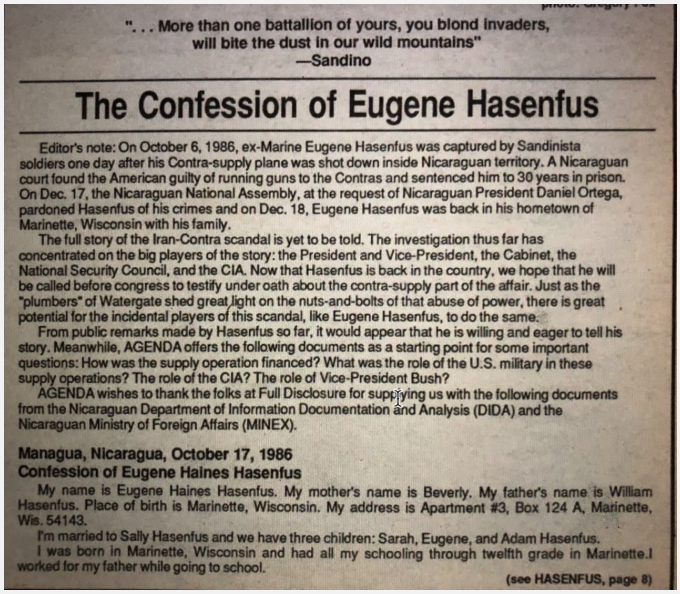
Through the use of CIA proprietary companies, drugs and monies were moved through Panama and Mexico to the U.S. and other destinations. General Noriega was a key figure in these operations.

The unfortunate downing of a Corporate Air Services aircraft supplying contras in Nicaragua and Honduras on October 5 th , 1986 started a chain of events that would result in both criminal and Congressional investigations in addition to the death of several key figures having knowledge or direct involvement in "The Enterprise".

The sole survivor of the crash was Eugene Hasenfus, an ex marine and Air America employee.

Hasenfus was the CIA operative [a cargo handler] captured by the Nicaraguan Army on 6 October 1986 after his airplane was shot down over Nicaragua's southern region and where he had parachuted safely to the ground. [He had been previously ordered to no t wear a parachute! The pilot and co-pilot were killed in the crash.] He thus functioned in that chaotic region of the planet as a spy of sorts, chiefly providing arms to the Contra Rebels (Ronald Reagan's covert crusade.) His capture eventually led to the revelation of, and subsequent media frenzy over, the infamous Iran-Contra Affair .

Below you will find the confession of Mr. Hasenfus, which lay out the operational and command structure of the operations.



"... More than one battallion of yours, you blond invaders,
will bite the dust in our wild mountains"
—Sandino

The Confession of Eugene Hasenfus

Editor's note: On October 6, 1986, ex-Marine Eugene Hasenfus was captured by Sandinista soldiers one day after his Contra-supply plane was shot down inside Nicaraguan territory. A Nicaraguan court found the American guilty of running guns to the Contras and sentenced him to 30 years in prison. On Dec. 17, the Nicaraguan National Assembly, at the request of Nicaraguan President Daniel Ortega, pardoned Hasenfus of his crimes and on Dec. 18, Eugene Hasenfus was back in his hometown of Marinette, Wisconsin with his family.

The full story of the Iran-Contra scandal is yet to be told. The investigation thus far has concentrated on the big players of the story: the President and Vice-President, the Cabinet, the National Security Council, and the CIA. Now that Hasenfus is back in the country, we hope that he will be called before congress to testify under oath about the contra-supply part of the affair. Just as the "plumbers" of Watergate shed great light on the nuts-and-bolts of that abuse of power, there is great potential for the incidental players of this scandal, like Eugene Hasenfus, to do the same.

From public remarks made by Hasenfus so far, it would appear that he is willing and eager to tell his story. Meanwhile, AGENDA offers the following documents as a starting point for some important questions: How was the supply operation financed? What was the role of the U.S. military in these supply operations? The role of the CIA? The role of Vice-President Bush?

AGENDA wishes to thank the folks at Full Disclosure for supplying us with the following documents from the Nicaraguan Department of Information Documentation and Analysis (DIDA) and the Nicaraguan Ministry of Foreign Affairs (MINEX).

Managua, Nicaragua, October 17, 1986
Confession of Eugene Haines Hasenfus

My name is Eugene Haines Hasenfus. My mother's name is Beverly. My father's name is William Hasenfus. Place of birth is Marinette, Wisconsin. My address is Apartment #3, Box 124 A, Marinette, Wis. 54143.

I'm married to Sally Hasenfus and we have three children: Sarah, Eugene, and Adam Hasenfus.

I was born in Marinette, Wisconsin and had all my schooling through twelfth grade in Marinette.I worked for my father while going to school.

(see HASENFUS, page 8)

[aa13][GDrive]

The Case of Eugene Hasenfus

Managua, Nicaragua, October 17, 1986
Confession of Eugene Haines Hasenfus
(cont. from page 1)

After graduating from high school in June, 1960, I enlisted in the Marines. My rank was E4 and my serial number was 1917376. I completed Air Borne and Riggers and was assigned to 1st Air Delivery Platoon, Camp Pendelton, California. My duty stations were Okinawa and Camp Pendleton, California. I was discharged from the Marines in 1965 at Camp Pendelton.

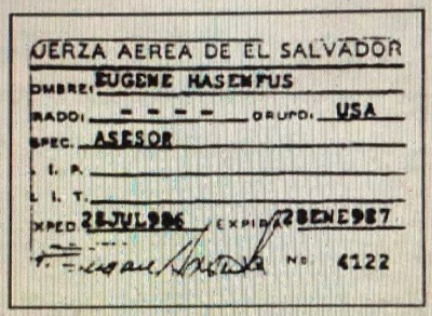
In 1966, through Job Service, I got my job with Air America. Air America in Southeast Asia had different contracts with U.S. Aid, USOM and the embassy. Many contracts were with the CIA to deliver military aid. I worked with Air America until 1973 in which I terminated myself.

In 1973 I got married to Sally and we started our family. My employment was in construction.

In June of 1986, I was called by an ex-Air America Pilot, Bill Cooper, and was asked if I would be interested in flying in Central America. The work would be much the same as Air America in Southeast Asia. On July 7, 1986, I went to Miami, Florida and was hired. The name of the company was Corporate Air Services.

While in Miami, Mr. Cooper took me over to Southern Air Transport and showed me one of the C-123's we would be flying out of El Salvador. We also talked about wages. The wages were to be $3000 per month and we would be working [from] El Salvador and Honduras and flying into Nicaragua. Any time we flew into Nicaragua we were to receive $750.00.

On July 10th, I was booked on TACA Airlines to El Salvador and was met in El Salvador by John McRainey. The other American personnel that were there were: Buzz Sawyer, Dan Gamblin, Joe Messer and Ernie and later on there was Jerry Stimdel, Jake Worel, John Piowate, Dave,



FUERZA AEREA DE EL SALVADOR
NOMBRE: EUGENE HASENFUS

ESPEC. ASESOR
I. P.
L. I. T.
EXPED 28-JUL-986 EXPIRA 28-ENE-987
No 4122

Frank, Moe Becker.

Corporate Air Services was a front name for Southern Air Transport and was to fly aid and military aid to and from Honduras and into Nicaragua for armed groups which carried the names such as FDN and UNO.

This work was coordinated by Bill Cooper but mostly by Max Gomez and Ramon Madina [who] worked for the CIA. Max Gomez was a personal friend of Mr. George Bush through the CIA.

I participated in flights from Ilopango, El Salvador to Aguacate, Honduras. From Aguacate we would have flights to and from Mokoron and Rus Rus. The cargo carried was mainly food and some small arms and ammunition belonging to an armed group which fought against the Nicaraguan government and carried the name of FDN.

Out of Aguacate, we would make night drops into Nicaragua. I was on four of these night drops. The drops were made by the Rio Grande de Matagalpa between El Gallo and San Pedro del Norte in a DHC-4 Caribou. The cargo also belonged to the FDN.

Out of Ilopango, El Salvador we would take a C-123K and go south to Costa Rica and then east into Costa Rica and then back north into Nicaragua and drop small arms and ammunition. I was on six of these flights to drop zones near Bluefields and the River Punta Gorda.

On October 5th, 1986, Captain Bill Cooper, co-pilot Buzz Sawyer and myself left our residence for Ilopango air base. We arrived at Ilopango about 8:30. The aircraft we were flying was a C-123K [serial] # C-825, loaded with 10,000 lbs. [Nicaraguan reports state 20,000 lbs.] of small arms and ammunition. We left Ilopango air base at 9:30 with an extra passenger who was a Nicaraguan radio operator.

The aircraft proceeded out over the ocean. We were going south about forty miles off the Nicaraguan coast. When we got to Costa Rica the aircraft [turned] east into Costa Rica. There was a checkpoint on the Nicaragua-Costa Rica border river. The checkpoint was an island in the turn of the river where a boat was sunk. At this point we would turn north into Nicaragua and were heading for our drop zone. About four minutes out from our drop zone the aircraft was hit by a ground-to-air missile. The right engine and wing blew up and the aircraft lost immediate control. At this time I bailed out [at] about 3000 feet and watched the aircraft spin into the ground. Each crew member had a pistol and the radio operator had an AK-47. I was captured the next morning by the soldiers who shot the aircraft down. At the time I was captured I was carrying a 7.82 mm pistol of Russian design.

The cargo that was being carried on this trip came out of Aguacate by DHC-4's into Ilopango, and was transferred there onto the C-123K #C-825 and was property of the FDN and was to be dropped to their armed groups in Nicaragua.

Eugene Hasenfus

[aa14][GDrive]

The United States Government vehemently denied any connection to the doomed flight or their purported CIA activities.

Here you will find a CIA sanitized document concerning the CIA and government denial of the aircraft and its activities.

Reagan Administration Denies U.S. Link to Plane

STAT

By Joanne Omang
Washington Post Staff Writer

Top Reagan administration officials yesterday flatly denied any U.S. government connection with a transport plane that the Sandinista government said it shot down in Nicaragua with three Americans and a man of Latin origin aboard.

At the same time, U.S. officials indicated that they knew more about the situation than they were willing to disclose, including the names of those killed in the crash. Secretary of State George P. Shultz said the aircraft was "hired by private people" who "had no connection with the U.S. government at all." He said they were "not from our military, not from any U.S. government agency, CIA included . . . . These are private citizens."

A spokesman for the Central Intelligence Agency denied the agency was involved in the mission, as the Nicaraguan government asserted, but refused to deny that it knew anything about it.

The issue of CIA involvement was heightened by Wisconsin relatives of Eugene Hasenfus, the lone survivor of the crash. Sen. David F. Durenberger (R-Minn.), chairman of the Senate Select Committee on Intelligence, told reporters that Hasenfus' wife, Sally, had telephoned the State Department yesterday morning from her home in Marinette, Wis., "and said her husband worked for the CIA."

A spokesman for Sally Hasenfus said she "is not granting any interviews to anyone." Earlier Hasenfus was quoted by wire services as saying of her husband, "I don't know where he is and what he's doing. I only know what I see on the TV, too, and I really don't know anymore."

The Associated Press said that Hasenfus' brother, William, reportedly told a friend that Hasenfus had gone to work 20 years ago for Air America in Vietnam, when it was a CIA cover company, and later returned to work for the firm readying cargo for air drops.

Kathy Pherson, a CIA spokesman, denied any link. "We have nothing to do with the plane, nothing to do with the guy. He does not work for us, and we are not involved," she said. The CIA is barred by law from aiding the Nicaraguan contras, or counterrevolutionaries, with anything but intelligence information, "and we do not break those restrictions," she said.

Asked whether that meant the agency knew nothing about the incident, Pherson said, "I can't help you."

Asked to identify the four men, State Department officials said they had the names but would not reveal them. They would not say how they had obtained the names.

Elliott Abrams, assistant secretary of state for inter-American affairs, told reporters that if reports that the four were carrying arms to anti-Nicaraguan rebels were true, "then they are heroes."

Ernesto Palazio, spokesman here for the United Nicaraguan Opposition, the rebels' umbrella organization, said the downed plane "could very well be" one of the contras' planes, but that he was not yet certain. "Ever since Congress placed restrictions on aid, we have had to go get private donations," he said. "Occasionally we have had to use the services of volunteers to complement our own pilots."

He said there had been no contact yet with contras on the ground near the crash site in southern Nicaragua.

Spokesmen for several groups previously associated with aid shipments to the contras denied any link to or knowledge of this flight. They included officials of the Civilian Materiel Assistance, formerly Civilian-Military Assistance, in Memphis, which supplies medical and other aid and which lost two members in a September 1984 helicopter crash in Nicaragua.

Retired major general John K. Singlaub, head of the U.S. Council for World Freedom in Phoenix, who has spoken proudly of facilitating arms purchases for the contras, said from the Far East through spokeswoman Joyce Downey that he knew nothing about the plane. "We have located all of our people," Downey said.

Officials of Southern Air Transport in Miami, whose planes have reportedly been chartered for previous aid flights to Nicaragua, said they knew nothing about this one or Hasenfus. William Hasenfus said his brother, Eugene, had been working for a Florida air freight company, but refused to name it.

Defense Department records show that a Eugene Hasenfus joined the U.S. Marines on May 9, 1960, was trained as a parachute rigger for equipment drops and sent to Camp Pendleton, Calif., where he remained until he left the service as a corporal June 17, 1965.

His military records say he did not serve abroad. His stepmother, Theresa Hasenfus, told The Associated Press, however, that he had served in Vietnam.

Durenberger said at a news conference that the CIA had assured the intelligence committee that "there is absolutely no connection between that plane, what was in that airplane, the pilots or anybody else [on board] and a U.S. government-financed or -sponsored effort such as the so-called contra operation."

Durenberger added that he believes the agency: "They have so much riding on this . . . . I don't think they've ever lied to any of us. The problem is what they don't tell you."

Sen. Patrick J. Leahy (D-Vt.), the committee vice chairman, said he was concerned that the flight might have been "connected with any of these soldier of fortune type operations which are sort of sent out there with a wink and a shrug as a way of going around our stated foreign policy." If there is such a link, he said, "then I think we're in for some very serious trouble."

Committee spokesman David Holliday said later that, based on current information, "nobody on the committee believes that the CIA or any government agency violated the law or did something they shouldn't have done."

[aa15][GDrive]

Sanitized Copy Approved for Release 2010/06/21 : CIA-RDP90-0

Rep. Michael D. Barnes (D-Md.), head of the Foreign Affairs subcommittee on Western Hemisphere affairs, said he thought it "unlikely" that the government was not involved. "Very little of what's happening down there right now is not somehow affected by U.S. action," he said.

Rep. Henry B. Gonzalez (D-Tex.), meanwhile, called for a House investigation into two recent air crashes in Texas and Nicaragua to determine whether they were part of an alleged covert CIA operation aimed at toppling the Sandinista government.

Rep. Henry J. Hyde (R-Ill.), a member of the House Permanent Select Committee on Intelligence, said he agreed with Assistant Secretary of State Abrams. "The Soviets are pouring all kinds of stuff in there. And unless there's some kind of an effort at equalization, the contras will be overwhelmed," he said. "Anyone who's attempting to keep them viable, I say, 'God bless 'em.'"

Abrams said he thought the plane was "what we call a benefactor flight" of the sort that had "kept the resistance alive" since Congress cut off U.S. aid to it in May 1984. "Some very brave people . . . have been willing to actually bring this material into Nicaragua, which seems to be the case with this flight," Abrams said. "God bless them . . . . If these people were involved in this effort, then they are heroes."

He said he had "some intelligence about the plane" and the people on it but that the information "is not for public consumption."

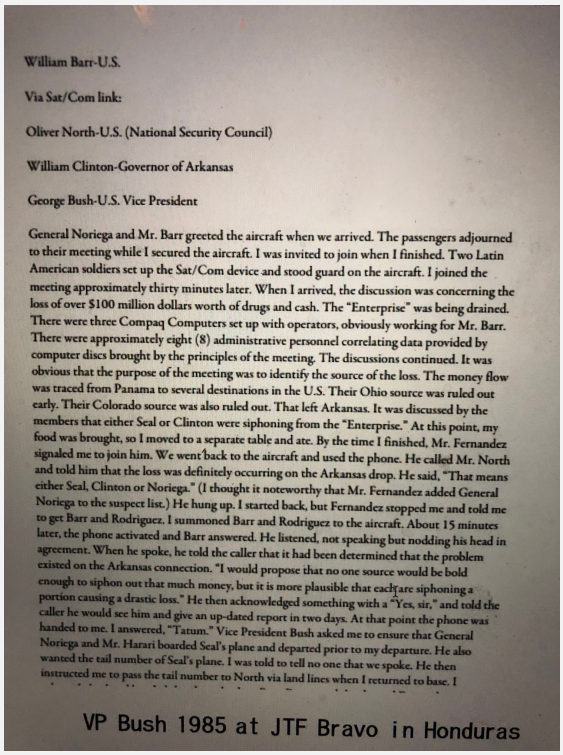
Asked about possible violations of the Neutrality Act, which bars U.S. citizens from supporting attacks on nations with which the United States is not at war, Abrams said he had advice for others seeking to aid the Nicaraguan rebels: "If you're planning to do something like this, get yourself a lawyer."

[aa16][GDrive]

Ultimately, the government would accept responsibility for the flight and curtail all activities by Corporate air Services, They did not, however stop the supply train to the contras.

While utilizing the proprietary company Corporate Air Services, the CIA also utilized assets within the U.S. Military to accomplish their missions. Pilots stationed in Honduras began supporting the Contras in the early 80's from an Air Force Joint Task Force out of Palmerola AFB. JTF Bravo pilots continued support via MEDEVAC Helicopters flying from Honduras to the various contra camps in Nicarauga.

Here is a flight plan filed by pilots of one such flight. Supporting documents are found on Page 48 of the Tatum Chronicles



William Barr-U.S.

Via Sat/Com link:

Oliver North-U.S. (National Security Council)

William Clinton-Governor of Arkansas

George Bush-U.S. Vice President

General Noriega and Mr. Barr greeted the aircraft when we arrived. The passengers adjourned to their meeting while I secured the aircraft. I was invited to join when I finished. Two Latin American soldiers set up the Sat/Com device and stood guard on the aircraft. I joined the meeting approximately thirty minutes later. When I arrived, the discussion was concerning the loss of over $100 million dollars worth of drugs and cash. The "Enterprise" was being drained. There were three Compaq Computers set up with operators, obviously working for Mr. Barr. There were approximately eight (8) administrative personnel correlating data provided by computer discs brought by the principles of the meeting. The discussions continued. It was obvious that the purpose of the meeting was to identify the source of the loss. The money flow was traced from Panama to several destinations in the U.S. Their Ohio source was ruled out early. Their Colorado source was also ruled out. That left Arkansas. It was discussed by the members that either Seal or Clinton were siphoning from the "Enterprise." At this point, my food was brought, so I moved to a separate table and ate. By the time I finished, Mr. Fernandez signaled me to join him. We went back to the aircraft and used the phone. He called Mr. North and told him that the loss was definitely occurring on the Arkansas drop. He said, "That means either Seal, Clinton or Noriega." (I thought it noteworthy that Mr. Fernandez added General Noriega to the suspect list.) He hung up. I started back, but Fernandez stopped me and told me to get Barr and Rodriguez. I summoned Barr and Rodriguez to the aircraft. About 15 minutes later, the phone activated and Barr answered. He listened, not speaking but nodding his head in agreement. When he spoke, he told the caller that it had been determined that the problem existed on the Arkansas connection. "I would propose that no one source would be bold enough to siphon out that much money, but it is more plausible that each are siphoning a portion causing a drastic loss." He then acknowledged something with a "Yes, sir," and told the caller he would see him and give an up-dated report in two days. At that point the phone was handed to me. I answered, "Tatum." Vice President Bush asked me to ensure that General Noriega and Mr. Harari boarded Seal's plane and departed prior to my departure. He also wanted the tail number of Seal's plane. I was told to tell no one that we spoke. He then instructed me to pass the tail number to North via land lines when I returned to base. I

VP Bush 1985 at JTF Bravo in Honduras

[aa18][GDrive]

*The documents indicate that General Noriega was suspected of draining monies and drugs from "The Enterprise". In later documents recovered from Honduras it would be revealed that both **Barry Seal** and Manual Noriega were to be eliminated. The Clintons were found to be supporting The Enterprise as agreed.*

Thus in February 1986, Barry Seal was assassinated outside a federally protected facility in Baton Rouge Louisiana.

*5 May 1989: An aide to President Ronald Reagan was convicted after a newspaper reported that the US had secretly supplied arms to Iran From **Alex Brummer** and **Martin Walker** in Washington. The former National Security aide, **Oliver North**, the man at the heart of the 1986 Iran-contra affair, was yesterday found guilty on three counts including deceiving Congress and receiving an illegal gratuity in a verdict which seems certain to rebound with a vengeance on President Bush and his predecessor, Mr Reagan.*

The three counts were: shredding government documents; accepting a bribe in the shape of a security fence; and seeking to keep the truth from Congress.

Emerging from the courtroom yesterday, the chief prosecutor, Mr John Kekker, said: "The jury has spoken after a long and difficult trial and the principle that no man is above the law has been vindicated." Mr Kekker, a marine veteran of Vietnam like North, added: "He has been found guilty of three very serious charges" in a case which "some people said could not be tried." The North verdict paves the way for several other Iran-contra trials including those of Admiral John Poindexter, the former national security advisor; as well as middlemen, Mr Richard Secord and Mr Albert Hakim.

The Special Prosecutor is expected to continue his investigations which could affect several figures in the Republican Administration. As the verdict emerged

The Special Prosecutor is expected to continue his investigations which could affect several figures in the Republican Administration. As the verdict emerged, President Bush sought to clear his own name saying: "There has been much needless, mindless speculation about my word of honor." The President has said that he would respond to questions about his role in the affair as soon as the trial ended.

The Findings :The Jury appeared to have accepted the arguments of the defense lawyer, Mr Brendan Sullivan that North was only following the orders of his White House superiors. They were convinced, however, that North should be declared a common criminal for arranging for a $13,800 (£8,118) security fence for his Virginia home and for joining his secretary, Ms Fawn Hall, in the destruction of sensitive government documents and falsifying the record after congressional and other investigations of his activities had begun. The counts on which North has been found guilty carry penalties which could put him behind bars for 10 years and result in fines of up to $750,000. The sentencing has been set for June 23. There has been no indication from President Bush that he would consider a pardon for the man he considers a hero for his service in Vietnam and Central America. The verdict by a Washington jury of nine men and three women came after 23 days of deliberation and less than 24 hours after Judge Gerhard Gesell urged them to put in longer hours to reach a decision. It brings to a jolting end North's claims throughout congressional testimony that he was simply the fall guy, carrying out his superiors' orders. This verdict became problematic for Bush and the "Enterprise". It paved the way for further in depth investigations and trials, no doubt leading to the involvement by the White House and Oval office. Witnesses had to go, and on top of the list were several high profile officials.

*The General Has To Go : In a 1985 meeting, in Costa Rica, **William Barr** advised V.P Bush that funds and product were being siphoned off by partners in "The Enterprise". Bush ordered Barr to find out who was responsible. The Finding was simple. The Clintons were cleared, but Barry Seal and Manual Noriega were the thieves. Vice President Bush was adamant that both Seal and Noriega had to be "taken care of". His fear of a path leading to the White House and possible impeachment at the minimum resulted in orders for is trusted counsel William Barr to pave the path and find a solution. Below is a synopsis of the meeting*

Who is William Barr

[See William Pelham Barr (born 1950)]

*From 1973 to 1977, William Barr was employed by the Central Intelligence Agency. A confidant to DCI ["Director of Central Intelligence'] GHW Bush, Barr was well trusted and very adept at whatever assignment given by the DCI. Barr was a law clerk to Judge Malcolm Wilkey of the U.S. Court of Appeals for the District of Columbia Circuit from 1977 through 1978. **He served on the domestic policy staff at the Reagan White House from May 3, 1982 to September 5, 1983, with his official title being Deputy Assistant Director for Legal Policy.***

As a confidant, V.P. Bush used Barr as unofficial legal counsel for "The Enterprise". As the result of the 1985 meeting he was well aware of the need to neutralize General Noriega. After all, it was Barr that found the thieves.

Seal was no longer a threat as he was "taken care of" in 1986 by friends of Jeb Bush out of Colombia..

The Path is Paved

In 1989, at the beginning of his administration, President George H. W. Bush appointed William Barr to the U.S. Department of Justice as Assistant Attorney General for the Office of Legal Counsel, an office which functions as the legal advisor for the President and executive agencies.

Barr was known as a strong defender of Presidential power and wrote advisory opinions justifying the U.S. invasion of Panama and arrest of Manuel Noriega, and a controversial opinion that the F.B.I. could enter onto foreign soil without the consent of the host government to apprehend fugitives wanted by the United States government for terrorism or drug-trafficking.

By mid-December that year, ties had deteriorated so far that President George H W Bush launched an invasion, ostensibly because a US marine had been killed in Panama City, although the operation had been months in the planning.

Noriega sought refuge in the Vatican's diplomatic mission in Panama City. The US tactic to flush him out was to play deafening pop and heavy metal music non-stop outside the building.

By 3 January 1990, it had worked and Noriega surrendered. He was flown to the US with prisoner of war status to face charges of drug-trafficking, money-laundering and racketeering.

Although Barr had written the opinion that the invasion was justified, It was up to Attorney General Dick Thornburgh to prosecute the General.

Though General Noriega was indicted in February 1988, the three lawyers who prosecuted him were assigned exclusively to the case only after he was brought to the United States in January 1990. Until then the case had been developed by Government lawyers largely for political purposes and with no certainty that it would ever go to court.

Many Worries at First

The chief prosecutor would be Michael (Pat) Sullivan who would be assisted by Myles H. Malman and William C. Bryson, the deputy United States Solicitor General, a specialist in classified documents.

The prosecutors had a number of concerns: an indictment they considered weak, a decision by the Government not to try to consolidate the charges against the General a move that would have strengthened the team's hand and the possibility that the defense would exercise the General's right to an immediate trial, thereby forcing them to play their hand as it was dealt.

But the Government team also said it got a break when the defense elected not to exercise its right to a speedy trial. Under Federal law, General Noriega and others charged with him would have been entitled to a trial within 70 days of arraignment.

President Bush was briefed by AG Richard Thornburgh concerning the lack of evidence and confidence in gaining a prosecution. It did not take Bush long to come up with the answer. "We need The Mule".

Mueller was working as the U.S. Attorney for Massachusetts when he got the call and according to a Princeton alumni report, was on the next plane.

Mueller and Barr became friends in the early to mid 70's as both assets of the CIA.

The Mule proceeded to train Sullivan on witness intimidation and training techniques. Ethical conduct was off the board. Mueller explained that they are dealing with a murderer, drug lord, and terrorist.

They assessed the prospective list of witnesses to determine who would be the witness best to deliver the blow to the Jury. Gabriel Taboada was chosen. Taboada was extradited from Switzerland and placed in protective custody. Facing 25 years on drug charges and money laundering, he was given the opportunity to receive

extradited from Switzerland and placed in protective custody. Facing 25 years on drug charges and money laundering, he was given the opportunity to receive testimony necessary to convict Noriega. In return he was promised minimum security prison and rapid freedom.

Barr, Sullivan and Mueller would weave a story which guaranteed a conviction. And if delivered properly by Taboada a jury would have to convict.

Taboada's testimony was so convincing that the Justice Department decided to use him in several other high profile cases.

Unfortunately for Taboada, his sentence was not reduced as promised.

Taboada was eventually released only to be killed in Bogota by a gunman.

On April 9, 1992, Noriega was convicted on eight counts of drug smuggling and racketeering. He received a 40-year sentence, reduced to 30 years, and served 17 years before being extradited to France for money laundering, signed on the order of Secretary of State Hillary Clinton.

General Manual Noriega died on May 29 th , 2017.

Here is the announcement about The Mules return to the Department of Justice. Mueller joined the U.S. Department of Justice in 1989 to spearhead the prosecution of Panamanian dictator Manuel Noriega. He took charge of the DOJ's criminal division in 1990, where he oversaw the Lockerbie bombing case and formed the agency's first cyber-dedicated unit.

Mueller is the assistant to Attorney General Dick Thornburgh and as acting Deputy Attorney General. James Baker, with whom he worked on national security matters.

BCCI : Enter "The Mule"

In 1986 investigations began into banks tied to the Iran Contra scandal.

In 1989 it was found that a small bank branch in Atlanta, Georgia was making large loans to Iraq. As Justice Officials briefed the President, an emergency session with his trusted inner circle was called.

The CIA and The Enterprise apparently had accounts tied to the bank. An investigation would surely reveal the association to other banks and account owners which could be devastating.

As historian Roger Morris has usefully reminded us, Saddam's regime was midwifed by not one but two coups supported by the CIA: the first brought the Baathist Party to power, the second, an internal coup, engineered the ascension of Saddam's family-centered faction to the top. It is unlikely that Saddam would have ever been a position to impose his perverted militarist vision on Iraqi society without the assistance of the elitist operatives whose headquarters now proudly bears the name of George Herbert Walker Bush. Let us also remember that Saddam was sustained in his harsh rule with the eager support of Ronald Reagan and the aforementioned George H.W. Bush. Indeed, the latter's passionate embrace of Saddam seemed to know no bounds, so avidly did Bush ply the dictator with money, agricultural credits (which allowed Saddam to use his scarce hard currency for weapons) and advanced technology – including "dual-use" gear for weapons of mass destruction – despite the strong warnings of his own Cabinet against such reckless policies, and a 1989 report by the CIA that Iraq had greatly accelerated its nuclear program, and was now the world's largest maker of chemical weapons.

Bush also used the global criminal network of the Bank of Credit and Commerce International (BCCI) to secretly funnel cash and weaponry to Saddam – then intervened to quash federal investigations of the scam. What was BCCI? Only "one of the largest criminal enterprises in history," according to the United States Senate. What did BCCI do? "It engaged in pandemic bribery of officials in Europe, Africa, Asia and the Americas," says journalist Christopher Bryon, who first exposed the operation. "It laundered money on a global scale, intimidated witnesses and law officers, engaged in extortion and blackmail. It supplied the financing for illegal arms trafficking and global terrorism. It financed and facilitated income tax evasion, smuggling and prostitution."

The Italian bank BNL was one of BCCI's main tentacles. BNL's Atlanta branch was the primary funnel used to send millions of secret dollars to Saddam for arms purchases, including deadly chemicals and other WMD materials supplied by the Chilean arms dealer Cardoen and various politically-connected operators in the United States like, weapons merchant Matrix Churchill.

As soon as the BNL case broke, Bush moved to throttle the investigation. He appointed lawyers from both Cardoen and Matrix to top Justice Department posts – where they supervised the officials investigating their old companies. The overall probe was directed by Justice Department investigator Robert "The Mule" Mueller.

*Additional support would be provided by **William Barr**. Meanwhile, White House aides applied heavy pressure on other prosecutors to restrict the range of the probe – especially the fact that Bush cabinet officials Brent Scowcroft and Lawrence Eagleburger had served as consultants for BNL during their pre-White House days as spear-carriers for yet another secretive international front that profits from war, weapons, and the avid greasing of highly-placed palms: Kissinger Associates.*

The U.S. Senate later found that the probe had been unaccountably "botched" – witnesses went missing, CIA records got "lost," all sorts of bad luck. Most of the big BCCI players went unpunished or got off with wrist-slap fines and sanctions.

John Kerry, Mueller friend and College Team Mate : The Unbeatable Duo

William Colby passed the mantle of secrecy as Director of the CIA to George H.W. Bush in 1976. Along with this mantle included "The List".

*As discussed earlier two of the trusted few on that list was Robert Swan Mueller III and **William P. Barr.***

William P. Barr earned his place in the intelligence community as a young legal aid to Director of Central Intelligence George H.W. Bush.

These two young CIA assets would soon form an alliance which would change the landscape of American Politics and protect the assets and operators in what would eventually be called, The Deep State.

In time they would both move up the proverbial ladder to become the leaders of our United States Justice System.

As CIA director in the mid-1970s and as Ronald Reagan's vice president, George H.W. Bush helped forge a world of strongmen, wars, cartels, and refugees that continues today. In particular, he was deeply involved in the events that became known as the Iran-Contra scandal, a series of illegal operations that began with a secret effort to arm Contra fighters in Nicaragua in the hopes of toppling the leftist Sandinista government; this effort became connected to drug trafficking, trading weapons for hostages with Iran, and banking scandals.

In 1987, Arthur Liman, chief counsel for the Senate Select Committee on Secret Military Assistance to Iran and the Nicaraguan Opposition, described it as a "secret government-within-a-government … with its own army, air force, diplomatic agents, Justice Department officials, intelligence operatives and appropriations

capacity."

Independent counsel Lawrence Walsh, tasked with investigating Iran-Contra, concluded that the White House cover-up "forestalled timely impeachment proceedings against President Reagan and other officials." Bush was a central figure in this.

Today the secret government has been renamed "The Deep State". This entity is comprised of government officials and permanent employees in decision making positions.

Without the support of the Deep State operators, an elected official is set on a path of destruction

https://www.law.virginia.edu/static/uvalawyer/html/alumni/uvalawyer/f02/mueller.htm

Mueller's work and reputation came to the attention of U.S. Attorney General Richard L. Thornburgh. He called Mueller in 1989 and asked him if he could oversee from Justice Department headquarters the prosecution of Manuel Noriega, a precedent-setting international law case with daunting political overtones. Mueller readily accepted, and the team won that case and jailed Noriega.

Elke Albers Weds Thomas Standish, III

The marriage of Elke Albers and Thomas Anderson Standish, III, took place on Saturday in the Community Church of Pound Ridge, N. Y. A luncheon given by Mr. and Mrs. Eric L. F. Archdeacon in their home, "Rippling Waters," in New Canaan, Conn., followed the ceremony.

Mrs. Standish is the daughter of Mrs. Walter Albers of Hannover, Germany, and the late Maj. Albers. The bridegroom is the son of Mr. and Mrs. Thomas A. Standish, Jr., of Sewickley and Edgartown, Mass.

The bride, given in marriage by Mr. Archdeacon, wore a silk organza gown, fashioned in empire style with a high neck and long sleeves. The gown and train were embroidered with Alencon lace. Her veil was French illusion.

Mrs. Robert S. Mueller, III, sister of the bridegroom, was chosen as matron of honor. Sarah Hanlin was maid of honor and Mrs. William A. Butler was bridesmaid.

Serving as best man was David Cabell Standish, brother of the bridegroom. Ushers included Robert S. Mueller, III, Joseph Judson Brooks, Jr., William A. Butler, George Hamlin and Andrew Clarke.

The bride graduated from the Wilhelm Stedler School in Hannover, Germany. She attended the Technical College, Gloucester, England, and the Sorbonne in Paris, France.

Mrs. Standish is a member of the International Services Committee of the New York Chapter of the Red Cross.

The bridegroom attended Sewickley Academy and is a graduate of Phillips Academy, Andover, Mass. He is a Magna Cum Laude alumnus of Yale University where he was a member of Phi Beta Kappa. He received his Ph.D. at Cernegie Institute of Technology.

Mr. and Mrs. Standish will reside in Cambridge, Mass., where he is assistant professor of computer science at Harvard University and Radcliffe College.

MRS. STANDISH

Alumni To Hear Thurgood Marshall

CHARLOTTESVILLE — University of Virginia law school alumni will hear U.S. Supreme Court Justice Thurgood Marshall Saturday at a question-and-answer session sponsored by the University's Student Legal Forum. Justice Marshall will be one of a number of legal authorities scheduled Friday and Saturday for the 16th Annual Law Alumni Day.

Former Virginia Governor Colgate W. Darden Jr. will address a Saturday luncheon of some 500 alumni from classes marking fifth-year anniversaries.

Darden, who served as president of the University from 1947 to 1959, will be introduced by Justice Albertis S. Harrison of the Virginia Supreme Court, a member of the law class of 1928. Following Darden's speech, awards will be presented to alumni celebrating 50-year reunions.

Judge John D. Butzner ('41) of the Fourth Circuit of the U.S. Court of Appeals and Judge John C. Godbold of the Fifth Circuit will join Justice Marshall Saturday at 8:30 p.m. in Cabell Hall to judge the Lile Moot Court competition. All three judges have selected clerks for next year from the law school classes of 1972 and 1973.

The case before the Lile Moot Court involves the balance between a soldier's right to free speech and the military's need to control its own affairs.

James K. Quillian from Miami, Fla., and Joseph A. Schwartz from Mishawaka, Inc., will argue the petitioner's side, with Timothy W. Finchem from Virginia Beach, and Virgil H. Goode Jr. from Rocky Mount, representing the soldier as respondent.

The ratio of in-state to out-of-state law students at the University and admissions criteria will be discussed at the Partnership Meeting, the focus for alumni of the weekend program, according to Frances Farmer, secretary of alumni planning committee and law school librarian.

State Sen. Edward Holland ('65), Professor Emerson G. Spies and third-year law student Robert S. Mueller III from Haverford, Pa., will represent the interests of each partner — alumni, faculty and students.

A second panel will consider implementation of a third year practice plan in Virginia in which students could practice law before graduation from law school.

Other activities include a picnic at "Verulam Farm,"

Lewis— Mueller

PRINCETON, N.J. — Patricia H. Mueller, daughter of Mr. and Mrs. Robert S. Mueller Jr., and Henry H. Lewis of Jericho, N.Y., were united in marriage Aug. 20.

Rev. Charles T. Fritsch officiated at the single ring ceremony in the Columbus Boy Choir School.

The bride wore an eyelet lace gown with train.

Joan B. Mueller was maid of honor. Bridesmaids were Polly Lewis, Cynthia Heyer, Cynthia Hoyt, Alice Mauran, Elizabeth Baker and Hanna McCrum.

Best man was Henry Lewis III, the groom's father. Ushers were Gregg Preston, John Nichols, Joe Cacioppo, Jay Dowling, Richard Priem and Robert S. Mueller III.

A reception was held at the Columbus Boy Choir School, following which the couple left for Vermont. They will live in South Burlington, Vt.

Mr. and Mrs. Lewis are students at the University of Vermont.

Charges Dropped

SAN FRANCISCO (UPI) — The government has dropped charges against three persons in the massive Hells Angels conspiracy and racketeering case, leaving 21 of the original 33 defendants still facing trial this fall.

Assistant U.S. Attorney Robert S. Mueller said Tuesday that charges were dropped against Anita Musick, 38, Castro Valley, Calif.; William Solano Jr., 36, Seattle, and Michael Overstreet, 31, Novato, Calif.

Of the original Hells Angels members and associates charged, nine had charges dropped or were convicted of minor charges, three are still fugitives and 21 face trial.

A previous nine-month trial of 18 defendants ended July 2 with a hung jury except for convictions of several persons on minor charges.

U.S. District Judge William H. Orrick has told attorneys to recommend how the case can be split into smaller units. He will rule on the matter Aug. 12.

CRIMINAL JUSTICE

Weld assembling impressive prosecutorial force

David Farrell

Two months ago when US Atty. William F. Weld began looking for a tough prosecutor to head his criminal division, he was hopeful but didn't expect to come up with a pair of outstanding prosecutors from other major Justice Department jurisdictions.

Within a fortnight of his telex message to various US attorney districts throughout the country soliciting candidates for chief of the criminal division in the Massachusetts office, Weld had nibbles from veterans in two of the busiest and most prestigious offices.

From Miami's Southern Florida District came an inquiry from First Asst. US Atty. C. Brian McDonald, a 40-year-old former Peace Corps volunteer with 15 years experience in civil rights and criminal investigation work for the government.

And from San Francisco's Northern California District came an application from Asst. US Atty. Robert S. Mueller 3d, former chief of that office's large criminal division. The 37-year-old Mueller, a much-decorated Marine Corps veteran of the Vietnam War, has worked closely with the Federal Strike Force on Organized Crime probing the vast underworld crime network headquartered in the Bay Area of California.

Weld, of course, was delighted at the prospect of getting two such outstanding men. But persuading men with growing families to leave the milder climates of southern Florida and San Francisco to come here was another matter and would be difficult, he knew.

And it was. But McDonald and Mueller, lured by the challenge in Massachusetts, decided to join Weld's staff after meeting with him and his chief deputy, Mark L. Wolf.

McDonald will head Weld's staff in the Springfield field office and be responsible for overseeing all investigations of criminal, civil and Hobbs Act (political corruption) cases in Western Massachusetts. A graduate of Union College in Schenectady, N.Y., and Georgetown Law School, he worked six years as the US Department of Health Education and Welfare's liaison attorney with Congress on civil rights and coal mine safety compliance legislation before joining the Justice Dept. in 1974. At Justice, he was senior trial attorney for civil rights violation prosecutions and then deputy chief of the department's criminal section for civil rights. In 1980, he left Washington to become first assistant in the Miami US attorney's office.

Mueller will join Weld's staff as chief of the criminal division in April. He is a graduate of Princeton and received a master's degree in international relations at NYU before entering the Marine Corps in 1967 as a 2d lieutenant. After OCS at Quantico, he graduated from the Army Ranger School and the Army Jump School before shipping overseas for combat service with the famous Third Marine Division. His battlefield bravery won him the Bronze Star, Navy Commendation with one star, the Purple Heart and the Vietnamese Cross of Gallantry.

Following his discharge as a captain, he attended Virginia Law School and then went to work as a public defender in San Francisco. After three years with a private law firm, he joined the US attorney's office in San Francisco where he specialized in criminal investigations.

Since persuading Wolf, who had been one of his two major competitors for the US attorney job here, to join his team as deputy US attorney and chief of his political corruption unit, Weld has been steadily assembling an unusually strong and experienced group of prosecutors.

Weld has hired 11 new assistants since he succeeded former US attorney Edward F. Harrington last fall. These, along with the veteran career assistants he inherited, constitute a highly skilled group of seasoned professionals.

Weld hopes to persuade several of them, including Asst. US Attys. Hugh Scott and Douglass Woodlock, to stay on. Scott, who prosecuted the Frank Tracey, Samuel Bithoney and George Stavros white-collar cases and is trying the Fall River (Arruda) Housing case, will handle the Jack Williams (Boston shakedown) prosecution next month.

Woodlock recently successfully prosecuted a Somerville housing scandal case, handled the Danvers cable TV investigation which led to the imprisonment of Charles O'Donnell and Raymond White, and got a guilty plea in the George Collatos Boston case.

Among Weld's new appointments is one which could cause him some flak with the Reagan Administration. When word gets back to Washington that former Norfolk County assistant DA Richard G. Stearns began work last Thursday as chief of Weld's Government Program Fraud section, there is likely to be grumbling in national Republican circles.

The 37-year-old Stearns, one of the many bright young men and women who have been trained by Dist. Atty. William D. Delahunt, has been active with national Democratic leaders and party causes, on and off, during and after his broad schooling at Stanford, American University of Beirut, Oxford and Harvard Law School.

In 1968, he was a regional campaign manager for former Sen. Eugene McCarthy's presidential campaign; four years later he was deputy campaign manager of George McGovern's presidential campaign; since then, he has worked for Michael Dukakis' successful 1974 campaign for governor and the winning efforts of US Reps. Edward Markey of Malden and Morris Udall of Arizona.

But Stearns' most visible political effort was his top position as director of delegate selection for Sen. Edward M. Kennedy's 1980 presidential campaign against former President Jimmy Carter. The Republican National Committee regards Kennedy as one of the major obstacles in the way of the GOP in the 1984 presidential election and is not likely to welcome Weld's selection of the highly qualified Stearns for a spot on his prosecutorial team.

Weld also has appointed another of Delahunt's able former assistants to a key slot in his office. A. John Pappalardo, who graduated from Suffolk Law in 1974, worked as deputy chief counsel to the Ward Corruption Commission for two and a half years before returning to Delahunt's office as head of his white collar crime unit in 1981. He joined Weld's staff three months ago and is working as one of Wolf's deputies in the political corruption unit.

Another highly regarded Weld appointee is Robert J. Cordy of Medford, who will begin work March 8 with Pappalardo in Wolf's special investigations political unit. Cordy, a Dartmouth and Harvard Law School graduate, is regarded as a "steal" by Weld from the State Ethics Commission where he has been working for three years as associate general counsel. In that capacity, he has directed the ethics panel's investigation and enforcement of the state's conflict of interest statutes.

Weld reached into Goodwin, Procter & Hoar to get attorney Brackett B. Denniston as chief of his business crimes section and attorney Tobin N. Harvey for Mueller's criminal division. Denniston is a magna cum laude out of Harvard Law and Harvey a graduate of Harvard College and Virginia Law School. Attorney Dennis J. Kelly from Herrick & Smith and Marie T. Buckley, a staff attorney with the Mass. Defenders Committee, will also work for Mueller on criminal prosecutions. Attorney Ralph A. Child, a graduate of Dartmouth and Harvard Law, left Foley, Hoag & Eliot last November to join Weld's civil division.

David Farrell is a Globe political columnist.

U.S. Seizes Computers Sold Abroad

By Edward Cowan
©1982, New York Times News Service

WASHINGTON — As part of an ongoing effort to block unauthorized export of high-technology equipment, the United States commissioner of customs says he has seized $400,000 worth of U.S.-made computers in West Germany. The computers, he says, were believed to be en route to the Soviet Union.

But Glen Langdon, president of the company in Toronto that purchased and exported the equipment, denied that the computers were destined for the Soviet Union or that they were strategically important.

Langdon heads MLPI Business Systems Inc. of Canada. In a telephone interview last week, he said the computers have "been on the market since 1975" and were "as significant strategically as sending over a Dodge Dart."

Langdon said that he had sold "four minicomputers and a lot of spare parts" to two West German companies. He had not done business with them before, he said, but "they came armed with letters of credit" from Swiss banks, "the usual trade papers and introductions from sources in West Germany we were familiar with."

Robert S. Mueller, an assistant U.S. attorney in Boston, said that no charges had been filed in the case and that there was "no outstanding complaint or indictment." Mueller said that because a criminal investigation was under way he was prohibited by Justice Department guidelines from discussing the case in detail.

In a news release Tuesday, the U.S. Customs commissioner, William von Raab, said the seizure had been made in a joint operation by U.S., Canadian and German agents.

U.S. and Canadian agents, he said, had kept the equipment under surveillance as it was trucked to Toronto from the United States and had continued to watch it, in cooperation with German agents, after it arrived by air in West Germany.

Von Raab said the seizure on July 6 was part of the administraton's effort, begun in October 1981, "aimed at stopping the smuggling out of the country of high-technology equipment that has a military application."

He said "466 seizures of such equipment" had been made. Customs officials said that only after such seizures were agents able to determine by investigation whether the merchandise was being secretly rerouted to the Soviet Union or other unauthorized destinations.

U.S. policy for decades has been to deny export licenses to communist countries for goods and technical information believed to have "strategic" value. The meaning of "strategic," especially when similar equipment could be bought elsewhere, has kindled intense political debates since the 1950s.

Mueller refused to say why the authorities believed the computers might be destined for the Soviet Union. Noting that customs agents on Monday had searched the premises of a company in Phoenix, Ariz., affiliated with the company in Toronto, Mueller said the affidavit on which the search warrant was based was sealed.

Langdon said his company had bought the computers from Digital Equipment Corp., whose head office is in Maynard, Mass. The computers were ordered, he said, by two West German companies, which he identified as Semitech A.G. and Elmont A.G. He said he knew of no connection between the orders.

Man charged for bomb plot against Turkish consulate

BOSTON (UPI) — Federal officials have charged a 20-year-old California man with plotting to blow up the offices of the honorary Turkish consul general in Philadelphia.

Steven J. Dadaian of Canoga Park, Calif., was arrested last week in Boston and charged with interstate transportation of explosives after a suitcase containing dynamite was found at Logan International Airport, officials said.

Three other men were arrested in Los Angeles on the same day.

The FBI alleged in federal court in Los Angeles Thursday that the explosives were intended to be used on the offices of honorary Turkish Consul General Kanat Arbay.

A conspiracy charge, based on an affidavit filed in Los Angeles and Boston, was filed against Dadaian at a hearing Thursday before U.S. Magistrate Lawrence Cohen at which bail was reduced from $1 million to $500,000.

A conspiracy charge, based on an affidavit filed in Los Angeles and Boston, was filed against Dadaian at a hearing Thursday before U.S. Magistrate Lawrence Cohen at which bail was reduced from $1 million to $500,000.

Assistant U.S. Attorney Robert S. Mueller III told Cohen that Dadaian has "possible" ties to the Justice Commandos of the Armenian Genocide, a group seeking vengeance for the massacre of Armenians by the Turks in 1915. Dadaian's attorney said the charge was "fanciful."

The Armenians claim as many as 1.5 million of their people died during a war with the Ottoman Empire, but Turkish officials have strenuously denied charges of genocide and dispute the figures on the number of those killed.

The Commandos have claimed responsibility for the killing of Orhan Gunduz, the honorary Turkish Consul General of New England, last May in Somerville, Mass., Dadaian has not been charged in that killing.

Police said they found five sticks of dynamite, a detonator cap, an electronic arming device and a timer in a piece of luggage allegedly left by Dadaian at Logan Airport last Friday.

Trial opens for two accused in island drug-profit scheme

By William Doherty
Globe Staff

When Joseph Barkett appeared at the Registry of Deeds on Martha's Vineyard to "pass papers," closing the sale on a parcel of land in Edgartown, he did not bring a check for the purchase price, but, a jury was told yesterday, he brought the money in cash – $63,000 in small bills in a leather shoulder bag.

A federal prosecutor told the court that the cash was drug money Barkett was investing in expensive Martha's Vineyard real estate to conceal its source.

Barkett, 38 of West Tisbury, and Joseph C. Pioggia, 35, of Florence, both unemployed iron workers, are on trial in US District Court in Boston, charged under a so-called drug "kingpin statute." They are accused of "conducting a continuing criminal enterprise," supervising a cocaine-trafficking and money-laundering scheme centered on the resort island.

In his opening statement to the jury, Robert S. Mueller 3d, an assistant US attorney, said the lawyers assembled at the Registry of Deeds in Edgartown in October 1981, for the sale of the parcel on Slough's Cove road, were nonplussed when Barkett asked: "Do you mind taking cash?"

TRIAL, Page 26

■ TRIAL

Continued from Page 19

It took so long to count the money, Mueller said, the lawyers adjourned to a nearby bank and persuaded it to stay open after hours until they finished counting.

Conviction would bring mandatory 10-year minimum sentences and possibly life in prison. The indictment also seeks forfeiture of four pieces of real estate in Oak Bluffs and Edgartown, allegedly purchased with drug money.

Mueller said he will present evidence that Pioggia and Barkett made $320,000 in profits from the resale of eight kilograms (8.8 pounds) of cocaine flown from Florida for distribution throughout Massachusetts.

The prosecutor said evidence will come from the pilot who flew the cocaine, from a cousin of Pioggia's who helped distribute the drug in the Springfield area, and from a former Northampton lawyer who purchased cocaine.

According to Mueller, the key witness will be the pilot, Anthony A. Cellilli, 35, of Ludlow, who twice a month allegedly flew a one-kilogram cargo of cocaine in a private plane from Florida to Massachusetts

Cellilli is a former banker who also served as "straw" purchaser for Pioggia in several of the real estate deals. He has entered the federal witness protection program and has received a new identity.

Mueller said Pioggia's telephone conversations were taped and that Pioggia used "lumber" as a code word for cocaine.

Also on trial are Dennis Sagan and David Mastroianni, both of Martha's Vineyard. They are charged with conspiring to possess and distribute cocaine. Three other defendants have pleaded guilty and a fourth is a fugitive. The trial may last several months.

Jury to get Vineyard cocaine case

The case of two unemployed ironworkers accused of supervising a cocaine-trafficking and money-laundering scheme centered on Martha's Vineyard is scheduled to go to the jury today after a 33-day trial in US District Court in Boston.

Joseph C. Pioggia, 35, of Florence and Joseph Barkett, 38, of West Tisbury are charged under a so-called drug kingpin statute with "conducting a continuing criminal enterprise."

If convicted, Pioggia and Barkett face mandatory 10-year minimum sentences and could receive up to life in prison. The indictment also seeks forfeiture of four pieces of real estate, allegedly purchased with drug money, in Oak Bluffs and Edgartown.

In his closing argument to the jury yesterday, Assistant US Atty. Robert S. Mueller 3d said evidence showed Pioggia and Barkett cleared $300,000 in profits from the resale of 10 kilograms of cocaine flown from Florida to Massachusetts in an eight-month period in 1980 and 1981 for distribution throughout the state.

The principal prosecution witness was a pilot, Anthony A. Cellilli, 35, of Ludlow, who testified he flew the cocaine from Florida to Massachusetts twice a month in a private plane.

Prosecutors say Cellilli, a former banker, also served as "straw" purchaser for Pioggia in several of the real estate deals. He has entered the federal witness protection program, and received a new identity.

Defense lawyers Max Stern and Nancy Gertner attacked Cellilli's credibility during their final arguments. They said he was actually the "kingpin" who downplayed his own role to get immunity from prosecution. "He puts the finger on those below him and walks away," Gertner told the jury.

Also on trial are two codefendants who prosecutors say worked for the drug ring, Dennis Sagan and David Mastroianni, both of Martha's Vineyard. Their lawyers will make final arguments to the jury today, after which Judge Robert E. Keeton is expected to deliver his charge to the jury.

East German scientist accused of spying

N.Y. Times News Service

BOSTON — Alfred Zehe, an East German scientist accused of espionage, was held without bail this weekend after a prosecutor told Robert B. Collings, a U.S. magistrate, that Zehe would try to flee if released.

Assistant District Attorney Robert S. Mueller said Zehe, who was arrested Thursday at a Boston hotel while attending a scientific convention, was "a trained East German intelligence agent," and added, "It would be his duty to escape and to leave this jurisdiction if at all possible."

Zehe, a stocky, 44-year-old man with thick blond hair, was led into the courtroom in handcuffs. He turned to Mueller at the arraignment proceeding and denied the espionage charges, which carry a maximum sentence of death or life imprisonment.

"A highly trained spy?" Zehe asked, speaking softly, with a German accent. "I am very sorry, I am a university professor."

An affadavit filed in court by James E. Lancaster, a special agent of the Federal Bureau of Investigation, detailed several meetings between East German officials, Zehe, and a "confidential source" who cooperated with the bureau and the U.S. Naval Investigative Service.

The source, according to the affadavit, is "a private citizen employed in a responsible position" by the Naval Electronics Systems Engineering Center in Charleston, S.C. The affadavit said the source met in December 1981 with Dieter Walsch, an attache at the East German Embassy in Washington, who requested "classified U.S. defense information" in exchange for money.

The FBI and Naval Intelligence Service provided the classified documents, according to the affadavit. An FBI spokesman said the documents did not jeopardize national security.

The affadavit cited five meetings of the source with East German Embassy officials in Washington, seven meetings at the East German Embassy in Mexico City, and one trip to East Berlin. In Mexico, the source allegedly met Zehe, described by an East German counselor officer as a "scientific-technical expert" who would evaluate the document.

Mueller, Robert (Criminal Division), Washington, DC April 3, 1989

Organized Crime: National Organized Crime Strategy, memorandum to Robert Mueller, III, and report on Organized Crime Program accomplishments December 11, 1990

On July 12, 1988, President Reagan formally requested that Dick Thornburgh serve as his Attorney General, following the resignation of Edwin Meese, with only five months remaining in his presidency. On November 19, then President-elect Bush asked Thornburgh to stay on. Three years later, on April 4, 1991, the news of Pennsylvania Senator John Heinz's tragic death in a plane crash ultimately resulted in Thornburgh's resignation in August 1991 to run for the U.S. Senate. During his tenure, Thornburgh's priorities concentrated on drug trafficking, organized and white-collar crime, civil rights, antitrust and environmental fields. Major topics include: savings and loans scandals, Bank of Credit and Commerce International (BCCI) money laundering scandal, and Banca Nazionale del Lavoro (BNL). Thornburgh signed the United Nations Drug Convention in Vienna, December 1989, and participated in major TREVI (Terrorism, Radicalism, Extremism, Violence International) meetings. The war on drugs extended to South and Central America and topics include the apprehension of Noriega. Other topics are, for example: Project Triggerlock (regarding violent career criminals), the terrorist bombing of Pan Am flight 103, the bombing and death of Judge Robert Vance, Operation Weed and Seed, Superfund hazardous waste cleanup actions, and the Exxon Valdez case. During glasnost Soviet Justice Minister Veniamin F. Yakovlev invited Thornburgh to visit Moscow to discuss democracy, the rule of law, and human rights, the first visit ever by a sitting Attorney General of the United States to the Soviet Union. Thornburgh served as the Bush administration's "point man" for efforts to enact the landmark Americans with Disabilities Act (ADA), signed into law on July 26, 1990. Other matters on the domestic front include Thornburgh's participation in the Council on Competitiveness (CC), the Domestic Policy Council (DPC), Economic Policy Council (EPC), judicial appointment issues, and the so-called Thornburgh Memorandum. The Attorney General files are in fourteen sections: Speeches; News Releases; Transcripts; Nomination and Confirmation; Attorney General's Files; Daily Schedules; Events; Foreign Trips; DPC, EPC, and CC; Department of Justice Issues; Weekly Reports; Correspondence; News Clippings; and Reports. Digital reproductions of portions of the collection are available online.

1989 (May 21)

1989-05-21-nytimes-magazine-shaking-up-justice.pdf https://drive.google.com/open?id=13T59EdGpnqnIX71IOtIxdkAwfNhJbLfZ

Thornburgh is running the Justice Department today through three senior aides, all of whom served him during his two terms as Pennsylvania Governor, from 1979 to 1987. Closest is the executive assistant Robert S. (Robin) Ross Jr., deputy general counsel during Thornburgh's first term as Governor. As "gatekeeper," Ross shuttles requests and reports from the bureaucracy through the Attorney General's office.

Murray Dickman, a mustachioed computer jock, runs the Justice Department's budget and personnel operations. He also serves as the department's liaison to conservative political forces.

David Runkel, Thornburgh's low-key media adviser, also served as his press secretary in Harrisburg. Now press officials throughout the law-enforcement community report to Runkel each morning to alert him of potential public-relations problems in their departments and to receive their marching orders for the day.

As they did in Harrisburg, these three men have set much of the tone for Thornburgh's first year as Attorney General, leaving little doubt that change is afoot.

Thornburgh

Yes. But most of our department contact with the FBI was carried out through Bob Mueller, who was my personal assistant first and then head of the criminal division, and of course now is the director of the FBI. Again, one of those things where I didn't meddle with the FBI. If there was something going on there that I had to know about, then I counted on them to let me know or Mueller to let me know.

Early in the Bush administration it was quite clear that something had to be done about Manuel Noriega. He was under indictment in the United States, an indictment that had been secured under my predecessor. The President called me over one day to the White House to ask me, Was this a good indictment? Were we going to be able to convict him on these drug and money laundering charges that had been secured before the grand jury? He didn't have to spell it out for me, I could very easily get the drift that what was contemplated was some action designed to take him into custody and it would be a Pyrrhic victory indeed to take him into custody, bring him back here and find the case fell apart at the seams.

So I went back to the department, talked to Bob Mueller, who was then probably my special assistant for criminal matters, and asked him to undertake, as an experienced prosecutor, a review of the case, the evidence, and give me an assessment as to whether there was a good case. He did, there was, and I so advised the President. Of course, not long thereafter, Operation Just Cause was initiated and General Noriega was apprehended, brought back, tried, convicted and rests today in federal prison. That, I think, is a very important role for an Attorney General to play in advising the President on issues well outside the province of the Attorney General but a necessary predicate for that kind of action.

High Court, in Pornography Case, Tightens 'Sting' Rules

WASHINGTON (AP) — The Supreme Court on Monday limited some undercover "sting" operations when it ruled that a Nebraska farmer was entrapped by postal agents who coaxed him for two years to buy mail-order child pornography.

By a 5-4 vote, the justices said the farmer lacked predisposition to commit a crime and only purchased the contraband material after the prolonged solicitation of the government.

While the ruling is a defeat for law enforcement officials and a surprise from an increasingly conservative court, its impact could prove limited.

The court's four dissenters said the decision is a major departure that could hobble investigators. The majority said the ruling represents no change from standards that have let the government conduct sweeping undercover investigations into political corruption, drug dealing and fencing of stolen goods.

Justice Byron R. White wrote for the court, "In their zeal to enforce the law, government agents may not originate a criminal design, implant in an innocent person's mind the disposition to commit a criminal act and then induce commission of the crime so that the government may prosecute."

He was joined by Justices Harry A. Blackmun, John Paul Stevens, David H. Souter and Clarence Thomas.

Thomas' vote surprised many because the newest justice generally has taken a tough approach to crime and punishment.

Justice Sandra Day O'Connor, writing for the dissenters, said the ruling "redefines predisposition and introduces a new requirement that government sting operations have a reasonable suspicion of illegal activity before contacting a suspect."

She was joined by Chief Justice William H. Rehnquist, and Justices Antonin Scalia and Anthony M. Kennedy.

"There are good guidelines here that will protect some people who need protection," said Paul Marcus, a law professor at the College of William & Mary. "You can't pursue someone so relentlessly."

Assistant Attorney General Robert S. Mueller III said the court's decision was "generally limited" to the particulars of the Nebraska case, and "will not affect the government's sting operations in the areas of narcotics trafficking and similar crimes."

The case stems from the investigation of Keith Jacobson, 61, of Newman Grove, Neb.

Police found Jacobson's name on a San Diego, Calif., pornography bookstore's mailing list in 1984. He had ordered two nudist magazines from the store that were legal to purchase.

Postal inspectors continuously solicited Jacobson through the mail to buy illegal pornography. Investigators said he voluntarily responded to mailed questionnaires asking him about his interests in sexually explicit material.

He was convicted of receiving in 1987 a copy of a magazine called "Boys Who Love Boys." In the magazine, "11-year-old and 14-year-old boys get it on in every way possible," according to a catalog description.

Jacobson was sentenced to two years probation and 250 hours of community service. He lost his job as a school bus driver the morning after he was charged, and he said he was "humiliated and depressed" for months.

"Well, I'm overjoyed," Jacobson said Monday. "It's been almost a five-year ordeal. It's something I've learned to live with."

In other action, the court:

—Agreed to decide in case from New Jersey whether newspapers and other businesses can treat paying customers as depreciable assets worth millions in tax write-offs.

—Said it will decide in a District of Columbia case whether states may require all employers with health plans for active employees to provide the same benefits to employees eligible for workers' compensation.

—Let stand a ruling in a Virginia case that limits the power of federal prosecutors to seek longer prison terms for some defendants sentenced after plea bargains.

2001 - Considerations for new FBI Director

2001-06-12-the-atlanta-constitution-pg-a-23.jpg / https://drive.google.com/open?id=12TrPsiyIj9KRp_I_QGH62fyziZa7LlYL

Short list should be a little longer in Bush's search for FBI director

WILLIAM SAFIRE

The breakdown in FBI procedures that delayed Timothy McVeigh's execution may have been the last straw for Louis Freeh. The nonpartisan former agent and judge who was such a thorn in Janet Reno's partisan side decided to retire two years before his term was up.

Who will President Bush nominate to replace Freeh? The next FBI director will have to grapple not only with "the 10 most wanted" but with perpetrators of cybercriminal and bioterrorist crimes not yet nightmared of.

Needed is a director less ego-driven than J. Edgar Hoover, less politically loyal than L. Patrick Gray and less bureaucratically naive than William Sessions. William Webster — straight arrow, judicious, tough-minded — is a good model.

Oddly, Bush's search for Freeh's replacement has received little attention. Yet this will be as significant as any cabinet choice, directing more than 25,000 employees with an annual budget of $3.4 billion. The appointee will serve until 2011, well beyond the Bush years. From what I hear, the "short list" is too short.

The leading contender is Robert Mueller III. A marine with Vietnam service, he headed the Justice Department's Criminal Division in the final years of Bush the elder's administration. I remember him as an intelligent apparatchik who showed a marked lack of interest in pursuing the Iraqgate investigation. He helped staff the Public Integrity Division with time-servers who would not rock the boat.

Credit Mueller with political agility, however. In the Clinton years, he applied for a job with Eric Holder, then a U.S. attorney (later famed for his role in the Marc Rich pardon). As Democrat Holder moved up the ladder at Reno Justice, so did his friend Mueller, and — with the strong support of Sen. Barbara Boxer of California — Mueller was rewarded with a Clinton appointment as U.S. attorney in San Francisco.

Then, with Bush the younger's election, he spun about and made his bureaucratic expertise known to the knocked-about John Ashcroft. Named acting deputy attorney general, Mueller made certain his Public Integrity associates remained secure, taught the new deputy the ropes and now has Ashcroft's backing for the FBI job.

The professionals I know at Justice and the FBI are dismayed. The nimble Mueller may have blundered in failing to warn Ashcroft early about the McVeigh document botch, but he has law enforcement experience, an interest in the troublesome record systems and the advantage of being confirmable.

Senate confirmability has never been a more valuable asset. One ultra-liberal senator not only can block Bush's choice for the California appeals court, she also may be able to determine his pick for the FBI (Bring on a conservatives' Boxer rebellion).

Also on the short list is George Terwilliger III, a White & Case partner who was Mueller's boss in the last Bush administration, but whose legal representation of the Bush campaign in Tallahassee might arouse get-even instincts on the Judiciary Committee.

A third active possibility is Sterling Johnson Jr. (not III), a former New York City cop and prosecutor, named to the federal bench by Bush the elder 10 years ago along with Louis Freeh. The well-respected Judge Johnson would be the bureau's first black director, which could lessen internal tension. Problem: he's 67, not exactly geezerhood, but the appointment is to a high-pressure 10-year term.

Among African-American long shots are Ron Noble, New York law professor who has just taken a top job at Interpol, and Atlanta's Larry Thompson, just confirmed as deputy attorney general. But Thompson is being groomed to be the first black AG if Ashcroft goes home next year to regain his Senate seat.

Favorite choice among FBI agents would be one of their own who rose to be governor of Oklahoma, but the GOP's Frank Keating would take Democratic flak in hearings for heavy help to his children from a financier.

What should the president do? First, resist the rush. Next, interview a range of candidates himself; he's shown himself to be good at that. Finally, pick an experienced enforcer of the law who respects individual rights, and who will nip government corruption in the bud — even in the Bush administration.

2007 (May) - Passing of mother Alice Mueller

Alice Mueller

May 29, 2007

OBITUARY | GUESTBOOK | DIRECTIONS | PRINT PAGE

Alice (Truesdale) Mueller - Of Dedham, formerly of Philadelphia, PA & Wolfboro, NH, May 29, 2007. Beloved wife of Robert S. Mueller Jr. Devoted mother of Robert S. Mueller III of Washington DC, Susan M. Timchak of Lutz, FL, Sandra M. Dick of Brookline, Joan B. Mueller of Pownal, ME and Patricia H. Mueller of Jericho, VT. Also survived by 11 grandchildren & 4 great grandchildren. Sister of the late William Truesdale.

A private Funeral Service will be held at the George F. Doherty & Sons Wilson-Cannon Funeral Home, 456 High St., DEDHAM, on Thursday, Rev. Dorsey McConnell of the Church of The Redeemer, Brookline, will officiate. Private Interment.

In lieu of flowers donations may be made in Alice's memory to the American Cancer Society, 30 Speen St., Framingham, MA 01701-4688.

NFL

Mixed reaction on independent investigation

Jim Corbett and Josh Peter
@ByJimCorbett, @joshpeterII
USA TODAY Sports

Former FBI director Robert Mueller had barely been named to head the NFL's independent investigation into its handling of the Ray Rice domestic violence case and the move was being widely criticized.

Terry O'Neill, the president of the National Organization for Women (NOW), which has called for NFL Commissioner Roger Goodell to resign, questioned whether the investigation would be independent because the league has hired Mueller who works for a law firm that has represented the NFL. In addition, the investigation is being overseen by two owners.

WilmerHale has worked with the league on a variety of matters, such as the NFL Sunday Ticket broadcast package. In addition, Dick Cass — team president for the Ravens, who cut Rice on Monday — worked for WilmerHale before moving to his current role.

"That sounds like an insider investigation," O'Neill told USA TODAY Sports on Thursday. "There needs to be a truly independent, top-to-bottom review by individuals who have full authority to gather all the facts and to suggest solutions."

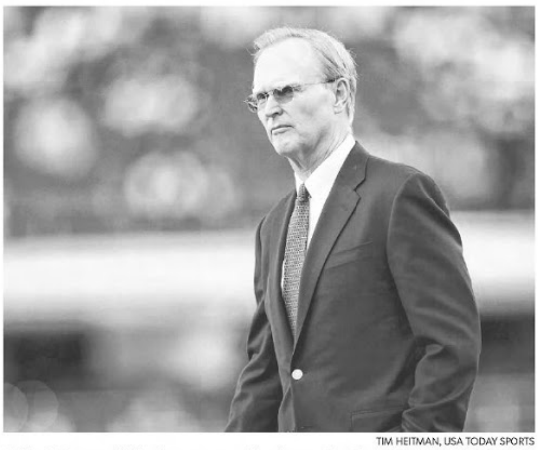
Attorney Peter Ginsberg, who represented then-New Orleans Saints linebacker Jonathan Vilma during an investigation into allegations that members of the Saints earned bonuses for inflicting injuries on opposing players, expressed skepticism about the league's plan.

Ginsberg pointed out that the NFL appointed an independent investigator, former U.S. attorney Mary Jo White, and her Bountygate investigation "failed significantly."

Goodell named former commissioner Paul Tagliabue to hear appeals from defensive players Vilma, Scott Fujita, Will Smith and Anthony Hargrove. Tagliabue affirmed Goodell's factual findings that the Saints operated a bounty program from 2009 to 2011. But his decision to vacate all penalties wiped Goodell's suspensions and fines off the board.

"It's also important to remember the last time the commissioner appointed a supposedly independent investigator that person was co-opted by the NFL and failed significantly in her responsibilities truly to investigate," Ginsberg told USA TODAY Sports, referencing White. "So the idea that Commissioner Goodell is the person appointing an independent investigator is troubling."

But attorney John M. Dowd, who conducted an investigation into the Pete Rose gambling scandal for Major League Baseball in 1989, said the criticism was unwarranted — in part because the NFL picked Mueller to lead the investigation.



TIM HEITMAN, USA TODAY SPORTS

John Mara will help oversee the investigation into the NFL.

"I don't think it's fair criticism," Dowd told USA TODAY Sports. "I think you've got to wait until he's done and see his work product and then make any judgments you want to make.

"Bobby Mueller is an outstanding lawyer, an honest man, and has a reputation to protect," Dowd said.

Dowd said also he had no qualms about New York Giants owner John Mara and Pittsburgh Steelers owner Art Rooney overseeing the investigation.

"I reported to the commissioner and the deputy commissioner of baseball," Dowd said. "The real key to all these investigations, inside the government or outside the government, is that they be done with integrity."

Mara and Rooney issued a joint statement Thursday and said they had been in contact with Mueller. The owners said the investigation would be independent and the final report would be made public.

"Our role is not to conduct or direct the investigation but to support Mr. Mueller and assist him in gaining whatever access or resources he needs," the statement reads. "Our sole motive here is to get the truth and then share Mr. Mueller's findings with the public."

Mueller is preparing to begin the investigation, according to the statement. "No timeline was established, and we stressed that he should take as much time as necessary to complete a thorough investigation," the statement read. "We agreed that the scope of the investigation should be aimed at getting answers to specific questions, including what efforts were made by league staff to obtain the video of what took place inside the elevator and to determine whether, in fact, the video was ever delivered to someone at the league office, and, if so, what happened to the video after it was delivered."

O'Neill did say Goodell recently took positive steps by reaching out to the National Network To End Domestic Violence and strengthening the league's policy against domestic violence.

"So I do see some movement," she said. "But the overarching picture you get is of an individual who only wants do as little as he can possibly get away with so he can go back to the business of making money."

Hermann Joseph Muller

From Wikipedia, the free encyclopedia

Jump to navigation
Jump to search

For other people with the same name, see Hermann Müller (disambiguation).

Hermann Joseph Muller (December 21, 1890 – April 5, 1967) was an American geneticist, educator, and Nobel laureate best known for his work on the physiological and genetic effects of radiation (mutagenesis), as well as his outspoken political beliefs.[2] Muller frequently warned of long-term dangers of radioactive fallout from nuclear war and nuclear testing, which resulted in greater public scrutiny of these practices.

Early life[edit]

Muller was born in New York City, the son of Frances (Lyons) and Hermann Joseph Muller, Sr., an artisan who worked with metals. Muller was a third-generation American whose father's ancestors were originally Catholic and came to the United States from Koblenz.[3] His mother's family was of mixed Jewish (descended from Spanish and Portuguese Jews) and Anglican background, and had come from Britain.[3][4] Among his first cousins are Herbert J. Muller and Alfred Kroeber (Kroeber is Ursula Le Guin's father).[3] As an adolescent, Muller attended a Unitarian church and considered himself a pantheist; in high school, he became an atheist. He excelled in the public schools. At 16, he entered Columbia College. From his first semester, he was interested in biology; he became an early convert of the Mendelian-chromosometheory of heredity — and the concept of genetic mutations and natural selection as the basis for evolution. He formed a biology club and also became a proponent of eugenics; the connections between biology and society would be his perennial concern. Muller earned a bachelor of arts degree in 1910.[5]

Muller remained at Columbia (the pre-eminent American zoology program at the time, due to E. B. Wilsonand his students) for graduate school. He became interested in the *Drosophila* genetics work of Thomas Hunt Morgan's fly lab after undergraduate bottle washers Alfred Sturtevant and Calvin Bridges joined his biology club. In 1911–1912, he studied metabolism at Cornell University, but remained involved with Columbia. He followed the drosophilists as the first genetic maps emerged from Morgan's experiments, and joined Morgan's group in 1912 (after two years of informal participation).[6]

In the fly group, Muller's contributions were primarily theoretical - explanations for experimental results and ideas and predictions for new experiments. In the emerging collaborative culture of the drosophilists, however, credit was assigned based on results rather than ideas; Muller felt cheated when he was left out of major publications.[7]

Career[edit]

In 1914, Julian Huxley offered Muller a position at the recently founded William Marsh Rice Institute, now Rice University; he hurried to complete his Doctor of philosophy degree and moved to Houston for the beginning of the 1915–1916 academic year (his degree was issued in 1916). At Rice, Muller taught biology and continued *Drosophila* lab work. In 1918, he proposed an explanation for the dramatic discontinuous alterations in *Oenothera lamarckiana* that were the basis of Hugo de Vries's theory of mutationism: "balanced lethals" allowed the accumulation of recessive mutations, and rare crossing over events resulted in the sudden expression of these hidden traits. In other words, de Vries's experiments were explainable by the Mendelian-chromosome theory.

resulted in the sudden expression of these hidden traits. In other words, do White's experiments were explainable by the Mendelian chromosome theory?

Muller's work was increasingly focused on mutation rate and lethal mutations. In 1918, Morgan, short-handed because many of his students and assistants were drafted for the U.S. entry into World War I, convinced Muller to return to Columbia to teach and to expand his experimental program.[8]

At Columbia, Muller and his collaborator and longtime friend Edgar Altenburg continued the investigation of lethal mutations. The primary method for detecting such mutations was to measure the sex ratios of the offspring of female flies. They predicted the ratio would vary from 1:1 due to recessive mutations on the X chromosome, which would be expressed only in males (which lacked the functional allele on a second X chromosome). Muller found a strong temperature dependence in mutation rate, leading him to believe that spontaneous mutation was the dominant mode (and to initially discount the role of external factors such as ionizing radiation or chemical agents). In 1920, Muller and Altenburg coauthored a seminal paper in *Genetics* on "modifier genes" that determine the size of mutant *Drosophila* wings. In 1919, Muller made the important discovery of a mutant (later found to be a chromosomal inversion) that appeared to suppress crossing over, which opened up new avenues in mutation-rate studies. However, his appointment at Columbia was not continued; he accepted an offer from the University of Texas and left Columbia after the summer of 1920.[9]

Muller taught at the University of Texas from 1920 until 1932. Soon after returning to Texas, he married mathematics professor Jessie Marie Jacobs, whom he had courted previously. In his early years at Texas, Muller's *Drosophila* work was slow going; the data from his mutation rate studies were difficult to interpret. In 1923, he began using radium and X-rays,[10] but the relationship between radiation and mutation was difficult to measure because such radiation also sterilized the flies. In this period, he also became involved with eugenics and human genetics. He carried out a study of twins separated at birth that seemed to indicate a strong hereditary component of I.Q. Muller was critical of the new directions of the eugenics movement (such as anti-immigration), but was hopeful about the prospects for positive eugenics.[11] In 1932, at the Third International Eugenics Congress, Muller gave a speech and stated, "eugenics might yet perfect the human race, but only in a society consciously organized for the common good.[12]

Discovery of X-ray mutagenesis[edit]

In 1926, a series of major breakthroughs began. In November, Muller carried out two experiments with varied doses of X-rays, the second of which used the crossing over suppressor stock ("CIB") he had found in 1919. A clear, quantitative connection between radiation and lethal mutations quickly emerged. Muller's discovery created a media sensation after he delivered a paper entitled "The Problem of Genetic Modification" at the Fifth International Congress of Genetics in Berlin; it would make him one of the better-known public intellectuals of the early 20th century. By 1928, others had replicated his dramatic results, expanding them to other model organisms, such as wasps and maize. In the following years, he began publicizing the likely dangers of radiation exposure in humans (such as physicians who frequently operate X-ray equipment or shoe sellers who radiated their customers' feet).[13]

His lab grew quickly, but it shrank again following the onset of the Great Depression. Especially after the stock market crash, Muller was increasingly pessimistic about the prospects of capitalism. Some of his visiting lab members were from the USSR, and he helped edit and distribute an illegal leftist student newspaper, *The Spark*. It was a difficult period for Muller both scientifically and personally; his marriage was falling apart, and he was increasingly dissatisfied with his life in Texas. Meanwhile, the waning of the eugenics movement, ironically hastened by his own work pointing to the previously ignored connections between environment and genetics, meant that his ideas on the future of human evolution had reduced impact in the public sphere.[14]

Work in Europe[edit]

In September 1932, Muller moved to Berlin to work with the Russian expatriate geneticist Nikolay Timofeeff-Ressovsky; a trip intended as a limited sabbatical stretched into an eight-year, five-country journey. In Berlin, he met two physicists who would later be significant to the biology community: Niels Bohr and Max Delbrück. The Nazi movement was precipitating the rapid emigration of scientific talent from Germany, and Muller was particularly opposed to the politics of National Socialism. The FBI was investigating Muller because of his involvement with *The Spark*, so he chose instead to go to the Soviet Union (an environment better suited to his political beliefs). In 1933, Muller and his wife reconciled, and their son David E. Muller and she moved with Hermann to Leningrad. There, at the Institute of Genetics, he imported the basic equipment for a *Drosophila* lab—including the flies—and set up shop. The institute was moved to Moscow in 1934, and Muller and his wife were divorced in 1935.[15]

In the USSR, Muller supervised a large and productive lab, and organized work on medical genetics. Most of his work involved further explorations of genetics and radiation. There he completed his eugenics book, *Out of the Night*, the main ideas of which dated to 1910.[16] By 1936, however, Joseph Stalin's repressive policies and the rise of Lysenkoism was making the USSR an increasingly problematic place to live and work. Muller and many of the Russian genetics community did what they could to oppose Trofim Lysenko and his Larmarckian evolutionary theory, but Muller was soon forced to leave the Soviet Union after Stalin read a translation of his eugenics book and was "displeased by it, and...ordered an attack prepared against it."[17]

Muller, with about 250 strains of *Drosophila*, moved to Edinburgh in September 1937, after brief stays in Madrid and Paris. In 1938, with war on the horizon, he began looking for a permanent position back in the United States. He also began courting Dorothea "Thea" Kantorowicz, a German refugee; they were married in May 1939. The Seventh International Congress on Genetics was held in Edinburgh later that year; Muller wrote a "Geneticists' Manifesto"[18] in response to the question: "How could the world's population be improved most effectively genetically?" He also engaged in a debate with the perennial genetics gadfly Richard Goldschmidt over the existence of the gene, for which little direct physical evidence existed at the time.[19]

Later career[edit]

Muller's house in Bloomington, Indiana

When Muller returned to the United States in 1940, he took an untenured research position at Amherst College, in the department of Otto C. Glaser. After the U.S. entry into World War II, his position was extended indefinitely and expanded to include teaching. His *Drosophila* work in this period focused on measuring the rate of spontaneous (as opposed to radiation-induced) mutations. Muller's publication rate decreased greatly in this period, from a combination of lack of lab workers and experimentally challenging projects. However, he also worked as an adviser in the Manhattan Project (though he did not know that was what it was), as well as a study of the mutational effects of radar. Muller's appointment was ended after the 1944–1945 academic year, and despite

difficulties stemming from his socialist political activities, he found a position as professor of zoology at Indiana University.[20] Here, he lived in a Dutch Colonial Revival house in Bloomington's Vinegar Hill neighborhood.[21]

In 1946, Muller was awarded the Nobel Prize in Physiology or Medicine, "for the discovery that mutations can be induced by X-rays". Genetics, and especially the physical and physiological nature of the gene, was becoming a central topic in biology, and X-ray mutagenesis was a key to many recent advances, among them George Beadle and Edward Tatum's work on *Neurospora* that established in 1941 the one gene-one enzyme hypothesis.[22] In Muller's Nobel Prize lecture, he argued that no threshold dose of radiation existed that did not produce mutagenesis, which led to the adoption of the linear no-threshold model of radiation on cancer risks.[23]

The Nobel Prize, in the wake of the atomic bombings of Hiroshima and Nagasaki, focused public attention on a subject Muller had been publicizing for two decades - the dangers of radiation. In 1952, nuclear fallout became a public issue; since Operation Crossroads, more and more evidence had been leaking out about radiation sickness and death caused by nuclear testing. Muller and many other scientists pursued an array of political activities to defuse the threat of nuclear war. With the Castle Bravo fallout controversy in 1954, the issue became even more urgent.[*citation needed*] In 1955, Muller was one of 11 prominent intellectuals to sign the Russell-Einstein Manifesto, the upshot of which was the first 1957 Pugwash Conference on Science and World Affairs, which addressed the control of nuclear weapons.[24][25] He was a signatory (with many other scientists) of the 1958 petition to the United Nations, calling for an end to nuclear weapons testing, which was initiated by the Nobel Prize-winning chemist Linus Pauling.[24]

Muller's opinions on the effect of radiation on mutagenesis, however, had been criticized by some scientists; geneticist James F. Crow called Muller's view "alarmist" and wrote that it created in the public "an irrational fear of low-level radiation relative to other risks".[26][27] It has been argued that Muller's opinion was not supported by studies on the survivors of the atomic bombings, or by research on mice,[28] and that he ignored another study that contradicted the linear no-threshold model he supported, thereby affecting the formulation of policy that favored this model.[23]

Muller was awarded the Linnean Society of London's Darwin-Wallace Medal in 1958 and the Kimber Genetics Award of the U.S. National Academy of Sciences in 1955.[29] He served as president of the American Humanist Association from 1956 to 1958.[30] The American Mathematical Society selected him as its Gibbs Lecturer for 1958.[31] He retired in 1964.[32] The *Drosophila* basic units of inheritance, their chromosomal arms, are named "Muller elements" in Muller's honor.[33]

H. J. Muller and science-fiction writer Ursula K. Le Guin were second cousins; his father (Hermann J. Muller Sr.) and her father's mother (Johanna Muller Kroeber) were siblings, the children of Nicholas Müller, who immigrated to the United States in 1848, and at that time dropped the umlaut from his name. Another cousin was Herbert J. Muller, whose grandfather Otto was another son of Nicholas and a sibling of Hermann Sr. and Johanna.[34]

Personal life[edit]

Muller is survived by his daughter, Helen J. Muller, now a professor emerita at the University of New Mexico, who has a daughter, Mala Htun, also a professor at the University of New Mexico. His son, David E. Muller, professor emeritus of mathematics and computer science at the University of Illinoisand at New Mexico State University, died in 2008 in Las Cruces, New Mexico. David's mother was Jessie Jacobs Muller Offermann (1890-1954), Hermann's first wife. Helen's mother was Dorothea Kantorowicz Muller (1909-1986), Hermann's second wife.[3] He had a brief affair with Milly Bennett.[35]

Impact[edit]

His work on the biological effects of radiation exposure is referenced in Rachel Carson's revelatory book, Silent Spring.[36]

Hamilton lab studies deadly new virus

BY DAVID ERICKSON
of The Ravalli Republic

HAMILTON — Scientists at Rocky Mountain Laboratories in Hamilton are scrambling to research and understand a deadly new virus that has sparked fears of a new SARS-like outbreak.

This newly identified coronavirus first caught the attention of scientists when it claimed the life of a man in Saudia Arabia this past September.

A short while later, doctors in the United Kingdom treated a man who had contracted the virus while traveling in Saudia Arabia. That patient survived, and there was a short lull of no new cases that had researchers cautiously optimistic.

However, in November, five more people died in Quatar and Saudi Arabia and four more were infected. The rapid spread of the disease brought back memories of 2003, when SARS caused a worldwide panic.

SARS (severe acute respiratory syndrome) is also caused by a coronavirus and killed more than 900 people in several different countries and sickened more than 8,000 other patients. The coronavirus is a nightmare for scientists because it can spread rapidly from person to person through the air. Until SARS, coronaviruses were viewed by most scientists as relatively harmless causes of the common cold.

> *'Our studies will provide valuable knowledge that should help us if this disease is indeed similar to SARS.'*
>
> **Dr. Vincent Munster, the head of the Virus Ecology Unit at RML**

Dr. Heinz Feldmann, the chief of the Laboratory of Virology at RML, which is a division of the National Institute of Allergy and Infectious Diseases, was among a group of scientists who tracked the spread of SARS in 2003 from its origin in southern China to a Hong Kong hotel, where several guests had contracted the virus.

In response to this new outbreak, he teamed up with Dr. Vincent Munster, the head of the Virus Ecology Unit at RML. They have begun to study the new coronavirus in Syrian hamsters and rhesus macaques, a monkey native to Asia.

"The virus appears to cause severe lung and kidney damage," Feldmann explained in a statement about the research. "We want to mimic human infection in an animal model to understand how this novel coronavirus causes disease and whether there is a potential for transmission of the virus among humans."

Other scientists at Erasmus University in the Netherlands are conducting similar tests in ferrets and cynomolgus macaques. The two research groups are coordinating their efforts to see which species might be the most suitable to study as a model of human infection, according to RML officials.

According to Feldmann and Munster, bats are quite possibly the natural carrier for the new coronavirus, since it is closely related to viruses only they carry. However, the precise mode of transmission is still unknown. Once the scientists learn how the virus spreads in an animal model, they will begin working on creating countermeasures such as antiviral treatments and vaccines to assist in preparedness efforts.

Right now, however, scientists are holding their breath hoping another outbreak doesn't occur before their research is done.

"Several weeks passed between the cases, so we still are not sure whether there is potential for this new coronavirus to infect more people," Munster said. "Our studies will provide valuable knowledge that should help us if this disease is indeed similar to SARS."

WHILE AMERICANS HAVE LARGELY MOVED ON FROM WORRYING ABOUT EBOLA, RESEARCHERS AT HAMILTON'S ROCKY MOUNTAIN LABORATORIES CONTINUE TO STUDY THE DEADLY PATHOGEN

photo by Cathrine L. Walters

In early February, thousands of volunteers in Monrovia, Liberia, signed up for the first large-scale human clinical trial of Ebola vaccines. A successful vaccine would be instrumental in stopping a virus that caused a worldwide fervor last year, infecting at least 20,000 people when a major epidemic spread throughout West Africa. In Monrovia, a coastal town of about 1 million, trial participants will receive a shot containing one of the vaccines or a placebo, and be monitored for side effects or reactions over the course of a year or so.

What those volunteers likely don't know is that one of the vaccines originated under the research program of Dr. Heinz Feldmann, who is currently chief scientist at the Rocky Mountain Laboratories, a facility occupying 36 acres in a quiet residential part of Hamilton in the Bitterroot Valley. In Feldmann's department, the Lab of Virology, he studies highly lethal pathogens in a secure setting.

"We are among a few programs among the U.S. and worldwide, just a handful, maybe two or three handfuls of programs, that have always concentrated on these rare diseases," he says. "That's our mission, that's why we're operating [at] high containment."

While the American media panic over Ebola has subsided, the disease has by no means disappeared. In early March, the World Health Organization marked a milestone of 10,000 recorded deaths from the illness. As new cases continue to crop up in West Africa, Feldmann and a team of internationally trained scientists keep hard at work unlocking the secrets of the pathogen and other diseases like it. Simply put, their continued efforts hold the potential to save lives around the world.

Numbers denote a research facility's security and safety settings, from level 1, comparable to a high school science lab, to 4, which is afforded to the most dangerous and exotic pathogens on earth, like Ebola. Very few labs in the world are equipped with Biosafety Level 4 protections, and Hamilton is home to the only BSL 4 lab in western North America.

Even entering the BSL 4 lab requires a year of training in proper safety procedures. Researchers don one-piece hooded suits, hook up to ventilation hoses and wear three pairs of gloves while working with samples that are kept in cabinets with a separate air flow. All cuffs are triple duct-taped to keep suits air-tight. The entire building's negative pressure airflow features redundant vent systems filtered by layers of HEPA screens, ensuring that if a microscopic pathogen somehow becomes airborne in the lab, it won't be able to make its way outside.

In a separate building, RML has a mock lab where new technicians get trained and visitors can see what it's like to wear the claustrophobic biohazard suits. Inside the helmet, the whooshing ventilation system makes it difficult to hear anything, and suits contain radio intercoms so researchers can chat with each other.

On a recent day inside the training lab, Dr. Vincent Munster, an ecologist-investigator who Feldmann invited to work at RML, demonstrates how he wriggles into and out of the suit in minutes, and how he's learned to deftly maneuver syringes and test tubes through several pairs of gloves. "It's very structured, there's not much that can go wrong," he says. Once he's in the lab, he can work for about five hours at a time before he's required to take off the suit and decontaminate in a 15-minute shower process. On busy days, he might suit up four to five times.

The rest of the RML campus has a multicultural, collegiate feel, with stately brick buildings and manicured lawns, and staff strolling around wearing street clothes and IDs dangling from lanyards. Conference rooms are equipped with high-tech SmartBoards and small bottles of hand sanitizer.

The BSL 4 lab is a relatively new addition to the RML campus, but scientists have been studying deadly diseases in this scenic mountain town for nearly a century. RML was founded as a site to study Rocky Mountain spotted fever, also called black measles, a tick-borne disease that plagued settlers of the Bitterroot Valley. In the early 1900s, some of the pioneering researchers studying Rocky Mountain fever worked out of tents and woodsheds. They also drew the ire of locals with their sometimes-offbeat ways of combatting the illness, like walking cattle through harsh baths of disinfectant.

In the mid-1920s, when the Montana Legislature appropriated funds to build a permanent lab in Hamilton, some residents protested, fearing diseased ticks would escape from the facility. Their concerns led to the construction of a small ditch around the research building because "ticks, it was supposed, could not swim the moat," according to a RML brochure. (The moat was never filled with water, and a historic placard currently marks where it used to be.)

Today, the lab is part of the National Institute of Allergy and Infectious Diseases, and its staff of about 450 studies everything from plagues to Chlamydia. In 2002, when RML announced plans to build the BSL 4 maximum-containment facility, it prompted fears from Bitterroot residents once again. Local organizations including the Friends of the Bitterroot filed a lawsuit alleging violation of the National Environmental Policy Act. They settled the suit in 2004 when, among other stipulations, authorities agreed

to build a special isolation unit within 75 miles of the lab that could care for any RML worker accidentally infected by a rare pathogen.

Accidents can sometimes happen. In 2004, the lab reported that 13 monkeys and several hamsters died when the heating system malfunctioned over the weekend in the 10,000-square-foot animal research wing, according to a *Billings Gazette* article. But to date, RML's BSL 4 facility has not recorded any lab-acquired infections in staffers.

Last year, St. Patrick Hospital briefly appeared on a list of four U.S. facilities equipped to handle Ebola patients, making the rare disease seem all too close to many western Montanans for the first time. But to doctors like George Risi, a Missoula-based private-practice infectious disease specialist and clinical consultant to RML, Ebola isn't a novelty.

"The typical American response to any of these kinds of diseases is, 'Oh, it's a disease of somewhere else,'" Risi says.

Before last year's outbreak in countries including Liberia, Sierra Leone and Guinea, Ebola was a rare but notable affliction. Less than 30 outbreaks have been recorded since 1976, when doctors in Sudan and Zaire first reported seeing patients stricken with an unfamiliar, grisly malady characterized by headaches, fever, bloody vomiting, diarrhea, unexplained bruising and death. The disease, formally called Ebola hemorrhagic fever, was eventually named after the Ebola River, near the village where it was first identified in Zaire (now referred to as the Democratic Republic of the Congo).

For most of the 20th century, Ebola was limited to small outbreaks in isolated rural regions, where it quickly flared up and burned out. But scientists and government officials took note of this new pathogen's mortality rate—untreated, Ebola fever kills as much as 88 percent of its victims—and the challenges it presented. Ebola sometimes disappears for up to 15 years without a trace, making it especially difficult to study, according to *Spillover: Animal Infections and the Next Human Pandemic* by David Quammen.

Scientists now have a better understanding of how Ebola emerges, since it is thought to naturally reside in jungle fruit bats and spread to humans through intermediaries like great apes and gazelle-like mammals called duikers. In many rural areas, villagers rely on bushmeat, or tropical game, as a source of protein. Several Ebola outbreaks have been tied to hunters or foragers finding infected carcasses and harvesting them. According to a recent RML study, the Ebola virus can remain viable for several days after the host has died, making it that much more dangerous.

Thanks to increasing development and industry, humans are coming into contact with Ebola-infected animals more frequently, says Risi. As part of his work with RML, he's trained local staff on what to do in case of an accidental exposure at the lab—and because of last year's epidemic, he's now dealt with Ebola in real life.

"When it became clear that this [2014] outbreak was not going to go like [previous smaller outbreaks], it was a chance for me to field-test, if you will, all the protocols, and get some real hands-on experience with taking care of Ebola patients," Risi says.

Risi spent three weeks in Sierra Leone last fall, along with a small team of American doctors and a nurse, working at the only hospital in the country equipped to help Ebola patients.

"Under the best of circumstances, those hospitals have limited resources," he says. "Sierra Leone went through a couple decades of civil war, huge deterioration of basic health care infrastructure… You couldn't pick a worse place for an outbreak."

Risi would arrive at the hospital around 8 a.m. each day, where he'd pull on a protective Tyvek suit, face mask, two pairs of gloves and rubber boots. The heat and humidity of the rainy season in equatorial Africa added to the challenge of caring for patients. "You can stay in that environment for about three hours or so before you need a break because you're dehydrated," he says. "Your body temperature is up to 103." He'd do about three shifts a day, seven days a week.

Risi estimates his group of five clinicians and a small local staff oversaw a staggering load of about 90 patients at a time, giving what basic help they could with intravenous fluids and antibiotics. Ambulances, which were just trucks painted white, brought in several new patients daily, sometimes from as far away as Freetown, a five-hour drive.

Nonetheless, Risi says, Ebola is a survivable disease if it's caught early enough and the patient is in otherwise reasonably good health. The virus mainly takes advantage of vulnerable populations in poverty-stricken rural areas.

"You go into these situations in Africa, you have people who may be malnourished, may have chronic malaria, may have a variety of intestinal parasites, are anemic, and then don't get to health care until late in their disease," he says. "In those situations, mortality is significantly higher."

When Risi left Sierra Leone, the disease was still raging. After a brief lull, the country recently reported a slight uptick. On March 8, Sierra Leone's vice president voluntarily quarantined himself after one of his security guards died, becoming one of the highest-ranked officials to acknowledge possible infection.

Risi was dismayed at the health care available for Ebola patients, but he has been impressed with how quickly Ebola vaccines have moved into human trials. Moving an experimental drug through development to clinical trials often takes five years at a minimum, he says, calling the pace that Ebola has moved into large-scale trials "unprecedented in the history of medicine."

That speed is due in part to the work being done at RML.

The two Ebola vaccines currently under study in Liberia are both based on the same principle: The outer shell of

TOP: Dr. George Risi, back row, and a team of American clinicians pose with Sierra Leone orphans whose parents died of Ebola. CENTER: Ecologist-investigator Dr. Vincent Munster wears a protective suit in the training laboratory that's similar to the kind worn inside the highly secure BSL 4 lab. BOTTOM: Munster, right, and a colleague take a blood sample from a hammer-headed fruit bat in the Republic of the Congo. The hammer-headed bat is believed to be a natural host for Ebola virus.

the Ebola virus is combined with the genetic backbone of another virus, which should trigger the patient's immune system to create antibodies to Ebola without developing symptoms of the disease. The vaccine template developed by Feldmann and his associates uses the vesicular stomatitis virus, a nonlethal disease that mostly affects South American cattle, as the delivery platform for Ebola.

Feldmann, a German-born medical doctor who did post-doctoral work at the Centers for Disease Control, says he's been working with vesicular stomatitis as a vaccine platform for at least a decade. Feldmann joined RML in 2008, when the lab constructed its high containment facility, and brought the ongoing Ebola research he'd done at a BSL 4 lab in Winnipeg, Canada, with him. He thinks the vesicular stomatitis virus is one of the most promising approaches for a viable vaccine, although he works strictly in the experimental side of the field.

"We design the approaches, we provide the experimental data on these drugs and vaccines, as far as it comes to animal models," he says.

Once Feldmann's team designs a vaccine platform and tests it on small primates, it can be sent off to other health authorities to be manufactured and tested on humans, as has happened with the Ebola vaccine.

The rapid progress with Ebola vaccinations wouldn't be possible without the body of work already established by scientists like Feldmann and Munster, and their interest in unusual pathogens. The researchers could conceivably spend years studying a virus that never poses a widespread threat to humans—or end up in the thick of an outbreak, like they did with Ebola.

Munster mentions other deadly diseases studied at RML that are currently as obscure as Ebola once was. The deadly Hendra virus, for instance, has only been recorded in seven human cases since it was discovered in Australia in 1994. Nipah, named after the region in Malaysia where it was first found, has caused a series of small outbreaks of respiratory ailments in southeast Asia. Munster says Nipah, unlike Ebola, can't be easily transmitted from human to human, but a chance genetic mutation could give it the ability to become the next public health threat.

"The viruses we work on are extremely lethal, but they cause relatively small outbreaks," says Munster. "But this particular [Ebola] outbreak in Liberia shows that most of these viruses do have the potential to cause harmful epidemics. I do think that's a validation for facilities like this."

Another key to stopping Ebola is to find out where it starts—and for researchers at RML, that means long weeks of venturing into the field.

Munster's studies begin on hot moonless nights in the Congolese jungle, where his team traps giant fruit bats in nets. It's part of a several-year study on the hammer-headed bat, which is believed to be a "reservoir" for Ebola. In epidemiology lingo, the "reservoir" host is the species that co-evolved with the virus, often going relatively unharmed by it.

Sometimes, when a virus escapes its natural host, it wreaks havoc on the other species it comes into contact with, as Ebola does with humans and other primates.

"And that's something we're trying to understand—why it's relatively benign in the reservoir host versus causing extreme disease in what we call a dead-end host, humans," Munster says.

The hammer-headed bat, which is the largest species of its kind in Africa with a three-foot wingspan, is easiest to catch when males gather to perform mating calls. "The sound is like, *bong bong bong*, really deafening loud," Munster says.

Once Munster's team sees a bat wiggling in the net, they take it to a nearby field lab and work under tents and generator-powered lights. While wearing protective clothing, researchers examine captured bats and take blood samples and swabs. Then, they release them back into the wild, so as not to disturb the natural ecology of the long-term study. He adds that he enjoys working with the bats, and finds the species docile and cute. "At least I think it's pretty," he says.

Field work in the Congo lasts about two weeks at a time, and Munster visits a few times each year. Once he returns to the lab, he and his team begin sorting through the samples to search for genetic evidence of Ebola or antibodies.

So far Munster has found evidence of Ebola antibodies in the bats, but he's still searching for the actual virus itself, which would be most useful for understanding how it co-exists with the species. His group has been gathering data since 2011, and he doesn't currently have an end-date for the study in mind. "There's always more to discover," he says.

Examining the spread of disease often exposes just how complex ecology really is. For instance, Munster says, the respiratory illness Nipah appeared periodically in Malaysia and Bangladesh at seemingly random intervals, affecting humans and pigs. The disease was found residing in

Inside the training lab, Munster demonstrates how he handles samples.

The hammer-headed fruit bat is one of Africa's largest, with a three-foot wingspan. photo courtesy of NIAID/WCS

fruit bats, but it was unclear how it was spreading to both pigs and people. In the mid-2000s, researchers discovered that Nipah-infected Bangladeshi villagers had one thing in common: they'd recently ingested raw date palm juice, a seasonal treat that's harvested similarly to maple syrup. The unfiltered juice was often contaminated by infected bat droppings. Nipah also afflicted Malaysian pig farmers when infected bats fed on fruit trees hanging over pig pens, spreading the disease first to the pigs and then to the humans that handled them. Once officials understood that was the case, they banned pork production and, so far, effectively limited additional outbreaks.

When it comes to stopping the spread of Ebola and diseases like it, Munster says it's important to maintain the balance of the ecosystem. Exterminating reservoir species, for instance, would be a terrible mistake. Fruit bats serve as pollinators and are crucial to jungle ecology. Plus, trying to slaughter the animals might lead to people coming into contact with infected tissue.

"Culling is not a feasible strategy, especially not in the jungle, because Africa needs those populations in the first place," he says.

Further complicating matters is development. As African nations open up to new businesses, Munster foresees new ways of disrupting wildlife and exposing humans to exotic diseases, particularly when it comes to foreign mining interests operating in the Republic of the Congo, where he studies bats. (The Republic of the Congo is the western neighbor of the Democratic Republic of the Congo, where Ebola was first discovered, and they are separate, sovereign nations.)

"So in this particular area," Munster says, while sketching a rough map on a conference room whiteboard, "what they're trying to do is, opening this stretch up to make it almost the same [size] as the road from Hamilton to Missoula, opening up pristine areas of rainforest for logging and mining… So that could potentially spark additional Ebola virus outbreaks."

The simplest and best defense at the moment, Munster says, is basic outreach and education in the communities most at risk. In the meantime, he'll continue to focus on better understanding how outbreaks come from reservoir species, as well as how they can be accelerated by the realities of modern life.

"That's what we saw with that case in Texas—everybody's a plane ride away," he says of an incident last September when a Dallas man died of Ebola fever after returning from a trip to Liberia.

The likelihood of another rare disease hitching a plane ride also bothers infectious disease specialist Risi. Ebola may seem like it's another continent's problem, even after last year's scare, but all it takes is one series of events for it to hit close to home. He cites the lessons of legendary infectious disease doctor Rene Dubos, who coined the term "think globally, act locally."

"Everything we do locally has an international impact," Risi says, "whether that's what we eat, whether we vaccinate our children or not, and provincialism, I think, is the major weakness in the American mindset."

Risi also says it's alarming to have observed first-hand how ill-equipped many countries are for dealing with major epidemics—especially combined with how many new diseases are discovered annually. New, lethal pathogens hit poor and densely populated communities the hardest, and the global population is only growing. It all adds up to a worrying set of circumstances.

"I have a lot of faith in medical science, and in vaccine development and treatments, but what keeps me up at night is the increasing disparity in health care that we can offer in developed parts of the world and what we can offer in places like Sierra Leone, Guinea and Liberia," he says.

He's at least encouraged by how the World Health Organization formed a more robust infrastructure in response to the Ebola crisis.

"This should never have gotten so out of control," he says. "And hopefully the next outbreak, we'll be much better able to control it before it gets bad."

- **Born** May 18, 1946 - ([HL006Y][GDrive] / [HL006Z][GDrive])

Resume - (2006, estimated)

Source : [HL0070][GDrive]

Dr Peter Keith Murray Peter Keith Murray BVMS(Glasgow) PhD(Glasgow) MRCVS FASM, has had a distinguished international career in veterinary science as the leader of the key national government animal health diagnostic laboratories in the United Kingdom, Australia, and the United States. During his appointment as Head of the CSIRO Australian Animal Health Laboratory at Geelong between 1989 and 1998, Keith Murray was a Professorial Associate in the Faculty of Veterinary Science, and made important contributions as a member of Faculty, and facilitator of research collaborations. After graduating in veterinary science from the University of Glasgow in 1969 Keith Murray spent two years as a lecturer teaching clinical veterinary medicine at the University of Nairobi, School of Veterinary Medicine, Kabete, Kenya, and commenced research on the pathogenesis of Haemonchus contortus known as the Barber's Pole Worm in sheep. He then returned to Glasgow as a research fellow and commenced research on the immunology and pathogenesis of African trypanosomiasis, also known as sleeping sickness in humans. In 1974 he returned to Africa as leader of a Rockefeller Foundation funded research project on trypanosomiasis in tolerant and resistant breeds of cattle at the Medical Research Council Laboratories at Faraja in Gambia. This research led to a position at the Merck, Sharp and Dohme Research Laboratories in Rahway, New Jersey in the United States and the discovery of novel therapeutics for African trypanosomiasis and trichomoniasis. In 1982 he was appointed Director of the Departments of Immunoparasitology and Experimental Pathology at the Merk, Sharp and Dohme Research Laboratories. His research team developed molecular vaccines for poultry coccidiosis and showed that these could be effective to prevent this economically important infection. Keith Murray was appointed Head of the Division of Immunology and Pathology and the Institute for Animal Health, Pirbright Laboratory in the United Kingdom in 1986. Here he led research on exotic virus diseases of livestock, particularly foot and mouth disease, African swine fever, rinderpest, and equine herpes virus infection, including the further development of molecular vaccines. Keith Murray was recruited to lead the CSIRO Australian Animal Health Laboratory at Geelong in 1989 as the second Head of this national laboratory which opened in 1985. From 1989 to 1998 the laboratory developed as a major international facility under his leadership with outstanding microbiological security status, and one of the world's major reference laboratories for animal disease diagnosis. In 1996, Keith Murray was awarded with the CSIRO Chairman's Medal, which recognised the best CSIRO research in 1994/5, for leading the team which investigated the outbreak of Acute Respiratory Syndrome and discovering a novel virus, the Hendra virus. This virus was shown to be carried by fruit bats, infected horses, and was able to be transmitted to humans with fatal outcomes. This work was recognized internationally for the speed, the accuracy, and the quality of the research. Keith Murray was recruited to become the Center Director of the United States Department of Agriculture National Animal Disease Center at Ames Iowa from 1998 to 2004. This is the United States Federal Government's largest animal health research facility. Keith Murray re-organised the laboratory's research programs, enhanced biosecurity and biosafety, and led the efforts that secured funding of $US460 million to build a new national facility for animal health research and diagnosis at Iowa that will be completed by 2010.

In recognition of his substantial contribution to international veterinary science, Peter Keith Murray is nominated for the award of Doctor of Veterinary Science honoris causa.

CSIRO online encyclopedia / Entry for "Keith Murray – Head of AAHL"

By Steve GartnerOctober 20th, 2014 / Source : [HL0071][GDrive]

Biography

Keith Murray was born in Scotland on 18 May 1946.

He obtained his BVMS (Bachelor of Veterinary Medicine & Surgery) degree in 1969 from the School of Veterinary Medicine, Glasgow University and became a registered member of the Royal College of Veterinary Surgeons in 1969.

From 1969 to 1971, he was a Lecturer, University of Nairobi, School of Veterinary Medicine, Department of Medicine, Kabete, Kenya, East Africa while on secondment from the University of Glasgow. The position was funded by the UK Overseas Aid Agency and involved teaching clinical veterinary medicine to undergraduate veterinary students; running an ambulatory clinic for farm animals and emergency services for companion animals; and conducting research on the pathogenesis of Haemonchus contortus in sheep.

From 1971 to 1974, he was a Research Fellow, University of Glasgow, School of Veterinary Medicine, Scotland where he completed his PhD in parasitology.

His thesis was titled 'Immunology and Pathogenesis of African Trypanosomiasis'.

He was a Registered Veterinary Surgeon with the Veterinary Board of Victoria from 1990 to 1998. He was awarded a DVSc (honoris causa) from the University of Melbourne in 2006.

Pre CSIRO research

From 1974 to 1976, he was a Research Fellow, Medical Research Council (UK) at the MRC Laboratories, Faraja, The Gambia, West Africa. There he was Leader of a Rockefeller Foundation funded ' Glasgow University staffed ' research project on the epidemiology and pathogenesis of trypanosomiasis in tolerant and resistant breeds of cattle in The Gambia, West Africa. At this time he also provided veterinary care (unpaid) for small animals and companion animals in the local community.

From 1976 to 1979, he was a Research Fellow, Department of Animal Infections, Merck, Sharp & Dohme Research Laboratories, Rahway, New Jersey, USA where he was involved in the planning and execution of research on African trypanosomiasis and trichomoniasis. During this time his team developed improved screening methods for compounds active against Trypanosoma and Trichomonas spp. and identified several lead compounds for development as trichomonicidal agents.

From 1979 to 1982, he was Associate Director, Department of Immunoparasitology, Merck, Sharp & Dohme Research Laboratories, Rahway, New Jersey, USA responsible for the planning and execution of research in immunoparasitology, particularly on coccidiosis, trypanosomiasis, Chagas' disease, ticks and gastro-intestinal immunity, in support of the discovery of new methods for controlling parasitic disease. During this time he identified 2-substituted 5-nitroimidazole (MK436) as being a curative in models of chronic Chagas' disease; developed improved methods for the synchronous culture of Trypanosoma cruzi amastigotes and trypomastigotes; developed a murine model of chronic human Chagas' disease; developed a greatly improved tissue culture procedures for the in vitro growth of the avian coccidian parasite Eimeria tenella which has allowed greatly improved drug screening procedures and quantitative assays for the effects of immunological mediations on infection.

From 1982 to 1986, he was Director, Departments of Immunoparasitology and Experimental Pathology, Merck, Sharp & Dohme Research Laboratories, Rahway, New Jersey, USA. His major achievements were: the discovery that poultry can be vaccinated successfully against coccidiosis using sub-unit materials; the identification of protective polypeptide and non-protein antigens in Eimeria tenella; the demonstration of protective antigens in E. acervulina that cross protect against heterologous species; and obtaining patents on E. tenella protective antigens: one on E. acervulina cross-protective antigens; another on an anti-idiotype vaccine. This work established the feasibility of developing a molecular vaccine to control coccidiosis, a major poultry disease in which prophylactic drug sales then exceeded $300 million annually. Unfortunately at the time of writing (2009), this vaccine for coccidiosis remains unrealised.

From 1986 to 1989, he was Head, Division of Immunology and Pathology, Institute for Animal Health, Pirbright Laboratory, UK where his Research Interests centered around development of molecular vaccines; exotic viruses, e.g. foot and mouth disease; rinderpest; African swine fever; immunology; tropical diseases and parasitology.

At CSIRO

Keith Murray joined CSIRO in 1989 as Head, CSIRO Australian Animal Health Laboratory (AAHL), Geelong, Victoria, Australia, and Deputy Chief, CSIRO Division of Animal Health, positions he held until 1998. During this time, building on the work of his predecessor, Dr Bill Snowdon, AAHL increasingly became viewed as a major international facility with a positive national and international image.

The AAHL scientific programs were completely restructured, as were the support programs. The science effort was successfully extended into new areas which were seen to provide national good; for example, much greater use of AAHL as a national facility by collaborating medical scientists and others and the initiation of major programs for the biological control of feral pests. One consequence was a significant increase in external funds for the laboratory.

Other major initiatives included broadening the scope of collaborations in Asia and an increasing emphasis on technology transfer and training to State laboratories. In addition, the quality of expert advice provided to government, especially the Quarantine Service, was increased markedly.

Some of the research successes during his time were the discovery of the Hendra virus, a novel agent that caused fatalities in horses and humans, and the discovery of a new rabies-related virus for the first time in Australia.

While at CSIRO he served as Chairman of the Sub-Committee of Animal Health Laboratory Standards (SCAHLS). This is a technical sub-committee of the national Animal Health Committee and its members included the principal laboratory officer of each State and Territory. It provides critical support to livestock commodity export industries, among others. Under his Chairmanship they published a fifty-four chapter volume of Australian Standard Diagnostic Techniques which is now used as the national laboratory standard; implemented a National Quality Assurance Program for veterinary laboratories covering tests for more than 30 diseases of export significance and obtained Quality Accreditation to ISO 9002 and ISO 25 Standards for AAHL and most principal State animal health laboratories.

Post CSIRO

Keith Murray resigned from CSIRO in 1998 to take up the position of Director, United States Department of Agriculture (USDA), Agricultural Research Service (ARS), National Animal Disease Center (NADC), Ames, Iowa, USA. In this position he is responsible for:

- the leadership and direction of the US Federal Government's largest animal health research facility
- planning and program development of research, goals and policies for USDA-ARS, with primary responsibility for NADC
- developing and directing research programs
- managing a major high-containment research facility with responsibility for around 300 scientific and support staff
- developing and monitoring budgetary priorities within a US$30 million annual budget
- maintaining the highest levels of biosecurity and biosafety
- communicating, and fostering collaborative research, with other government agencies, universities and outside institutions.

In this position he initiated the development of a Strategic Plan for genomics research at NADC leading to the development of comprehensive resources for genomics and bioinformatics capabilities for staff and collaborators. One consequence was that NADC, in collaboration with the University of Minnesota, was the first to fully sequence the genome of M. paratuberculosis, the causative agent of Johne's Disease.

Honours and awards

Fellowships

- 1998 : Appointment to the US Government Senior Executive Service, the SES includes the top managerial, supervisory and policy positions in the executive branch of the Federal Government
- 1998 : Coopers Lecturer, selected by Coopers Animal Health Ltd to provide a series of lectures around Australia and New Zealand on molecular vaccines for animal parasites
- 1993 : Fellow of the Australian Society for Microbiology

Awards

- 2006 : Awarded an honorary Doctorate of Veterinary Science, As a person distinguished in Veterinary Science by the University of Melbourne
- 1997 : The Arnold G Weedum Award, presented by the American Biological Safety Association, In recognition of outstanding work that provides greater knowledge in the field of biological safety
- 1996 : CSIRO Chairman's Medal

Committee work

- 2004 : Chair, National Centers for Animal Health, Board of Directors
- 2004 : Selection Committee, Dean of Veterinary Medicine, Iowa State University
- 2001 – 04 : Chair, Steering Committee for the Ames Facilities Modernization Plan
- 1999 – 2002 : Member, Biological Research and Development Corporation, Scientific advisory committee
- 1992 – 95 : Member, The AAHL-Berrimah Agricultural Research Centre Joint Program Management Committee, A national project to strengthen disease preparedness across Northern Australia
- 1990 – 97 : Chairman, Animal Health Committee Sub-Committee of Animal Health Laboratory Standards, SCAHLS, The Australian national committee for establishing quality systems across the veterinary laboratory network
- 1990 – 95 : Chairman, AAHL Industry Liaison Committee, The interface committee between CSIRO-AAHL and the livestock industries
- 1990 – 92 : Chairman, Animal Health Committee Sub-Committee on Fish Health, The Australian National Committee for establishing and maintaining policy and standards for fish health
- 1989 – 98 : Member, Australian Agricultural Councils Veterinary Committee, previously Animal Health Committee, The Australian national committee for developing and implementing animal health policies and operations
- 1989 – 98 : Member, Australian Agricultural Councils Consultative Committee on Emergency Animal Diseases, The Australian national committee dealing with exotic disease emergencies

The **National Cancer Institute** (**NCI**) coordinates the United States National Cancer Program and is part of the National Institutes of Health (NIH), which is one of

The **National Cancer Institute (NCI)** coordinates the United States National Cancer Program and is part of the National Institutes of Health (NIH), which is one of eleven agencies that are part of the U.S. Department of Health and Human Services. The NCI conducts and supports research, training, health information dissemination, and other activities related to the causes, prevention, diagnosis, and treatment of cancer; the supportive care of cancer patients and their families; and cancer survivorship.

NCI is the oldest and has the largest budget and research program of the 27 institutes and centers of the NIH. It fulfills the majority of its mission via an extramural program that provides grants for cancer research. Additionally, the National Cancer Institute has intramural research programs in Bethesda, Maryland and at the Frederick National Laboratory for Cancer Research[6] at Fort Detrick, in Frederick, Maryland. The NCI receives more than US$5 billion in funding each year.[7]

The NCI supports a nationwide network of 71 NCI-designated Cancer Centers with a dedicated focus on cancer research and treatment[8] and maintains the National Clinical Trials Network.[9]

History[edit]

Timeline[edit]

An early wooden sign for the National Cancer Institute

- August 5, 1937: President Franklin D. Roosevelt signed into law the National Cancer Institute Act (Pub. Law 75-244; 50 Stat. 559), which established the National Cancer Institute, as a division of the Public Health Service.[10][11][12][13]
- 1940: The first issue of the Journal of the National Cancer Institute was published.
- 1944: The United States Congress made the NCI an operating division of the National Institutes of Health by its passage of the Public Health Service Act. Congress later amended the Public Health Service Act with the National Cancer Act of 1971, to broaden the scope and responsibilities of the NCI "in order more effectively to carry out the national effort against cancer."
- 1955: NCI established the Clinical Trials Cooperative Group Program, which included several research networks that conducted cancer clinical research primarily under the sponsorship of NCI.
- 1957: The first cancer, choriocarcinoma, was cured with chemotherapy at NCI.
- 1960: NCI began funding government-supported cancer centers.
- 1971: President Richard Nixon converted the U.S. Army's former biological warfare facilities at Fort Detrick, Maryland, to house research activities on the causes, treatment, and prevention of cancer.
- 1971: The National Cancer Act of 1971 declares "war on cancer," establishes the National Cancer Advisory Board, and allots additional funding for cancer research.
- 1975: The Frederick National Laboratory for Cancer Research opened in Frederick, Maryland, as a Federally Funded Research and Development Center
- 1993: The NIH Revitalization Act of 1993 encourages NCI to expand its efforts in prostate cancer, breast and other cancers which primarily or solely affected women, and authorized increased appropriations.
- 1998: Establishes the Office of Cancer Complementary and Alternative Medicine to study pseudoscientific Alternative Medicine treatments for cancer
- 2009: The American Recovery and Reinvestment Act of 2009 provided US$10 billion in additional funding for the NIH; the NCI received US$1.3 billion from that amount.
- 2016: The 21st Century Cures Act increased funding for biomedical research. The "Cancer Moonshot" program promised additional support for cancer research.[14]
- On October 17, 2017, Norman Sharpless was sworn in as the 15th director of the National Cancer Institute. In April 2019, Sharpless left NCI to serve as the acting Commissioner of Food and Drugs.[15] He returned to the institute in November 2019 as director.[16]

Anti-cancer drug investigations[edit]

Alkylating agents

- Levamisole (Ergamisol) (1990)
- Hexamethylmelamine (Hexalen) (1990)
- All-trans retinoid acid (Vesanoid) (1995)
- Porfimer sodium (Photofrin) (1995)

Hormones and steroids

- DES (1950)
- Prednisone (1953)
- Fluoxymesterone (Halotestin) (1958)
- Dromostanolone (Drolban) (1961)
- Testolactone (Teslac) (1970)
- Methyl prednisolone
- Prednisolone
- Zoladex (1989)

Biologicals

- Alpha interferon (Intron A, Roferon-A) (1986)
- BCG (TheraCys, TICE) (1990)
- G-CSF (1991)
- GM-CSF (1991)
- Interleukin 2 (Proleukin) (1992)

Organization[edit]

The NCI is divided into several divisions and centers.[17]

Intramural[edit]

- Center for Cancer Research

  The CCR includes approximately 250 internal NCI research groups in Frederick and Bethesda.[18]

- Division of Cancer Epidemiology and Genetics

  DCEG is divided into the Epidemiology and Biostatistics Program and the Human Genetics Program.[19]

Extramural[edit]

- Division of Cancer Biology

  DCB oversees approximately 2000 grants per year in the areas of cancer cell biology; cancer immunology, hematology, and etiology; DNA and chromosome aberrations; structural biology and molecular applications; tumor biology and microenvironment; and tumor metastasis.[20] "Special Research Programs" falling under the aegis of the DCB include: Physical Sciences-Oncology Network, Cancer Systems Biology Consortium, Oncology Models Forum, Barrett's Esophagus Translational Research Network, New Approaches to Synthetic Lethality for Mutant KRAS-Dependent Cancers, Molecular and Cellular Characterization of Screen-Detected Lesions, Fusion Oncoproteins in Childhood Cancers, and Cancer Tissue Engineering Collaborative.[21]

- Division of Cancer Control and Population Sciences
- Division of Cancer Prevention
- Division of Cancer Treatment and Diagnosis

  DCTD supports eight research programs: The Biometric Research Program, The Cancer Diagnosis Program, The Cancer Imaging Program, The Cancer Therapy Evaluation Program, The Developmental Therapeutics Program, The Radiation Research Program, The Translational Research Program, and The Office of Cancer Complementary and Alternative Medicine.[22]

- Division of Extramural Activities

  DEA processes and supports the thousands of grant applications NCI receives each year and compiles reports on the progress of research funded by the NCI's programs.[23]

Office of the director[edit]

- Center for Biomedical Informatics and Information Technology
- Center for Cancer Genomics

  CCG was created in 2011 and is responsible for management of The Cancer Genome Atlas and cancer genomics initiatives.

- Center for Cancer Training
- Center for Global Health
- Center for Strategic Scientific Initiatives

  In the 1990s, the Unconventional Innovation Program was created to integrate interdisciplinary technology research with biological applications. It was reorganized in 2004 as the CSSI.[24]

- Center to Reduce Cancer Health Disparities
- Center for Research Strategy
- Coordinating Center for Clinical Trials
- Technology Transfer Center

Programs[edit]

NCI-designated Cancer Centers[edit]

The NCI-designated Cancer Centers are one of the primary arms in the NCI's mission in supporting cancer research. There are currently 69 so-designated centers; 13 clinical cancer centers, 49 comprehensive cancer centers, and 7 basic laboratory cancer centers. NCI supports these centers with grant funding in the form of P30 Cancer Center Support Grants to support shared research resources and interdisciplinary programs. Additionally, faculty at the cancer centers receive approximately 75% of the grant funding awarded by the NCI to individual investigators.[8][25]

The NCI cancer centers program was introduced in 1971 with 15 participating institutions.[26]

National Clinical Trials Network[edit]

The NCTN was formed in 2014, from the Cooperative Group program to modernize the existing system to support precision medicine clinical trials. With precision medicine, many patients must be screened to determine eligibility for treatments in development.

Lead Academic Participating Sites (LAPS) were chosen at 30 academic institutions for their ability to conduct clinical trials and screen a large number of participants and awarded grants to support the infrastructure and administration required for clinical trials. Most LAPS grant recipients are also NCI-designated cancer centers.[9] NCTN also stores surgical tissue from patients in a nationwide network of tissue banks at various universities.

Developmental Therapeutics Program[edit]

The NCI Development Therapeutics Program (DTP) provides services and resources to the academic and private-sector research communities worldwide to facilitate the discovery and development of new cancer therapeutic agents.[27]

Under the label "Discovery & Development Services" several services are offered, among them the NCI-60 human cancer cell line screen and the Molecular Target Program.[28]

In the Molecular Target Program thousands of molecular targets have been measured in the NCI panel of 60 human tumor cell lines. Measurements include protein levels, RNA measurements, mutation status and enzyme activity levels.[29]

NCI-60 Human Tumor Cell Lines Screen[edit]

The evolution of strategies at the National Cancer Institute (NCI) illustrates the changes in screening that have resulted from advances in cancer biology. The Developmental Therapeutics Program (DTP) operates a tiered anti-cancer compound screening program with the goal of identifying novel chemical leads and biological mechanisms. The DTP screen is a three phase screen which includes: an initial screen which first involves a single dose cytotoxicity screen with the 60 cell line assay. Those passing certain thresholds are subjected to a 5 dose screen of the same 60 cell-line panel to determine a more detailed picture of the biological activity. A second phase screen establishes the maximum tolerable dosage and involves in vivo examination of tumor regression using the hollow fiber assay. The third phase of the study is the human tumor xenograft evaluation.

Active compounds are selected for testing based on several criteria: disease type specificity in the in vitro assay, unique structure, potency, and demonstration of a unique pattern of cellular cytotoxicity or cytostasis, indicating a unique mechanism of action or intracellular target.

A high correlation of cytotoxicity with compounds of known biological mechanism is often predictive of the drugs mechanism of action and thus a tool to aid in the drug development and testing. It also tells if there is any unique response of the drug which is not similar to any of the standard prototype compounds in the NCI database.

Leadership[edit]

Director	Tenure	Notes
Carl Voegtlin[30]	1938–1943	
Roscoe Roy Spencer	1943–1947	
Leonard Andrew Scheele	1947–1948	Served as the seventh Surgeon General of the United States from 1948 to 1956.
John Roderick Heller	1948–1960	
Kenneth Millo Endicott	1960–1969	
Carl Gwin Baker	1970–1972	
Frank Joseph Rauscher, Jr.	1972–1976	
Arthur Canfield Upton	1977–1980	
Vincent T. DeVita, Jr.	1980–1988	
Samuel Broder	1988–1995	
Richard D. Klausner	1995–2001	11th Director, left to become President of the Case Institute of Health, Science, and Technology and later Executive Director of Global Health for the Bill & Melinda Gates Foundation.[31]
Andrew C. von Eschenbach	2002–2006	12th Director, served from 2001 to 2006 before transitioning to a role as Commissioner of Food and Drugs.[32][33]
John E. Niederhuber		

2006–2010

13th Director of the NCI, was nominated by President George W. Bush.[34]

Harold Varmus

2010–2015

Co-winner of the Nobel Prize for studies of the genetic basis of cancer.[35] He was director of the National Institutes of Health from 1993 to 1999.

Norman E. Sharpless

October 2017–Present

15th Director of the NCI.[36][37] Transitioned to acting Commissioner of Food and Drugs in April 2019 and returned to NCI in November 2019.[38]

Notable NCI faculty[edit]

- Amy Berrington de González, senior investigator and radiation epidemiology branch chief.
- Kathryn Zoon, Principal Deputy Director, 2002 to 2004.
- Michael B. Sporn was the Chief of the Laboratory of Chemoprevention, 1978 to 1995.
- Susan Gottesman
- Sankar Adhya
- Ira Pastan
- Elaine Jaffe
- Michael Gottesman
- Robert C. Gallo
- Michael Potter
- Sandra Wolin
- Charles J. Sherr
- Louis M. Staudt
- Gordon Zubrod
- Steven Rosenberg
- Frank Arguello
- Alfred Singer, Chief of the Experimental Immunology Branch of the National Cancer Institute

DESIRE MILLION FOR CANCER AID

Funds Would Provide for Work of Researchers; Disease Increasing

Washington, April 6 (AP)—Senator Homer T. Bone, of Washington, introduced recently on behalf of virtually the entire Senate membership a bill to authorize expenditure of $1,000,000 annually for cancer research.

The measure bore the names of more than ninety Senators. Congressional records showed this to be unprecedented, although some bills have carried twenty or more signatures.

Representative Warren Magnuson, of Seattle, introduced a similar bill in the House simultaneously with the Senate measure's appearance.

The bill would place the appropriation at the disposal of the surgeon general of the Public Health Service to "make grants-in-aid to schools, hospitals, laboratories and other institutions and to scientific investigators, whose work has shown promise of making valuable contributions to human knowledge with respect to the cause, diagnosis, control, treatment or prevention of cancer."

The money culd be used also to purchase radium to be loaned to state or privately owned institutions for cancer treatments.

Telephon

"Statistics show one in each ten persons past thirty-five years of age is destined to have cancer," Bone explained.

"This dread disease has been growing in importance in recent years until now it is second only to heart disease as a death cause. It outranks tuberculosis."

Despite the rank of cancer as a killed, he said, the amount spent annually for research by the United States Public Health Service and by private cancer research institutions " is less than the cost of building a few big guns."

He cited statistics to show the cancer death rate in United States has advanced from 86 to 100,000 population in 1921 to 116.2 for 100,-0000 in 1935.

Public health service figures showed 134,428 persons died from cancer in the United States in 1934, Bone said.

"The most distressing feature of the whole situation is that medical science is not armed with knowledge sufficient to conquer the disease," he added.

Bone said that "in the fact of the rapidly increasing death rate, Dr. James B. Murphy, of the National Cancer Council, estimates less than $200,000 is spent annually on all worthwhile cancer research in the United States."

1937 (Sep 19)

1937-09-19-the-san-francisco-examiner-pg-31.jpg

The United States Public Health Service Speaks:

Dr. L. R. THOMPSON, M. D.,
Asst. Surgeon General, U. S Public Health Service

Who Prophecies:

'Wider Diffusion of Knowledge to All People Will Save 28,000 Lives Every Year'

'Proposed National Cancer Institute Will Provide Maximum Study of Disease Which Takes Annual U.S. Toll of 140,000'

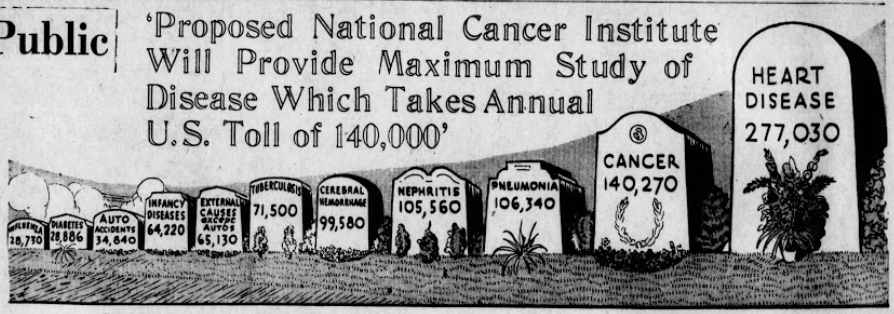

CHART SHOWING ELEVEN LEADING CAUSES OF DEATH

Increase in Deaths from Dread Ailment Could Be Retarded

By Dr. L. R. THOMPSON, M.D.,
Asst. Surgeon General, U. S. Public Health Service

CANCER is the second cause of death in the United States today, with only heart diseases outranking it. Last year approximately 140,000 persons died of cancer in this country, and there are 400,000 existing cases of cancer currently.

Unlike diphtheria, tuberculosis and scarlet fever, whose death rate is constantly declining, the death rate from cancer is increasing.

By 1960, according to tabulations based on our present figures, there will be a 50 per cent increase in deaths from cancer although there will be no change in the basic prevalence of the disease, because we will have a larger proportion of the population living long enough to die from the disease, which is primarily an ailment of older people.

Surely a disease which takes such a sweeping toll, and against which preventative measures are virtually useless, (since the cause of cancer may be said to be unknown), merits the maximum amount of research which can be given it.

It is the purpose of the proposed National Cancer Institute to gather, co-ordinate, and then disseminate all the existing information with relation to cancer which is available, or which will come to light as research and investigation progress.

Extensive Laboratory Investigation and Research of Cancer Causes and Treatments Will Be Fostered

Through appropriated funds, once the Institute itself is erected, equipped and staffed, the United States Government through the Public Health Service will be able to conduct experiments and investigations relating to the cause, diagnosis, and treatment of cancer, and assist and foster similar research activities by other agencies, both public and private, by the distribution of funds and the co-operation of personnel.

Laboratory research in the fields wherein lie present methods of investigation will be extensively carried out.

This includes the fields of pathology, radiology, advanced methods of cancer surgery, and research studies in bio-chemistry and bio-physics with their relation to the cancer problem.

While the National Cancer Institute, as created in the Public Health Service, comes under the jurisdiction of the Surgeon General, the bill signed by the President for the creation of a National Advisory Cancer Council of six members, to be appointed by the Surgeon General with the approval of the Secretary of the Treasury, and with the Surgeon General, ex-officio, as chairman.

These men, selected from leading medical or scientific authorities who are outstanding in the study, diagnosis or treatment of cancer in the United States, bring to the Institute the finest administrative and scientific minds available for the guidance of the Institute.

The people of the United States can look to them confidently for the most advanced thinking and ablest advice obtainable.

Two important functions of the National Cancer Institute, as provided in the bill, will be in relation to radium and in the training of personnel.

DR. THOMAS PARRAN, Jr., of New York, Surgeon General, U. S. Public Health Service. International News Photo.

Ablest Advice Obtainable From Finest Scientific Minds Will Aid the Entire Nation

With the approval of the Secretary of the Treasury, the Surgeon General is authorized to purchase radium from time to time, and then make that radium available on loan to institutions engaged in the study of the cause, prevention, methods of diagnosis or treatment of cancer, or for the actual treatment of cancer.

There is, at present, in this country, only about 50 per cent of the radium needed for such research and treatment, and this function of the National Cancer Institute is of inestimable value.

The provision for the training of such persons as the Surgeon General considers properly equipped (by reason of previous technical training) in all technical matters relating to diagnosis and treatment of cancer, is also of paramount importance.

Leading cancer authorities have stated that, if all the knowledge which we now have on the subject of cancer were made available to all the people, 20 per cent of the deaths now occurring from the disease could be prevented.

The training of personnel, whose future function will be mainly utilizing the knowledge they have gained, and making it available to larger numbers of sufferers from cancer, should substantially aid in the reduction of fatalities.

It was brought out when the original plans were formulated for the establishment of the National Cancer Institute that its primary object was to be research and the dissemination of information which results from these research activities.

Correct Diagnosis of This Dread Disease in Its Earliest Stages Is the Goal of the Institute

Clarifying the stipulation further, it should be stated that the establishment of no hospital or working cancer clinic is contemplated in relation to the Institute. There is a very definite need, on the part of hospitals already existing, for the services of trained scientific personnel, money to further their own research and enlarge their own cancer laboratories, and for radium for the treatment of cancerous growths.

With its determined policy to augment research and support worthwhile and promising cancer studies already being carried on by other organizations or institutions, the Institute will attack this problem solely from that angle.

What the establishment of this National Cancer Institute can mean to the people of the United States is not by any means limited to those now suffering from cancer.

The correct diagnosis of the disease in its early stages, before it has made such inroads that death can only be postponed, has always been and is at the present time a critical handicap in the prevention of fatalities.

The advantage to the people in having a centralized point of training, where men going into the field are given the latest available data and the most up-to-date courses in how to recognize the symptoms of cancer quickly and surely, is an advantage of OVERWHELMING VALUE IN THE CONCERTED WARFARE AGAINST THE DISEASE.

Men Are Better Drivers Than Women ! ! !

Thousands of Tests in 35 Cities In Widely Separated States Cited to Prove It

By BURTON W. MARSH,
Director of Safety and Traffic Engineering, American Automobile Association.

DRIVER tests in thirty-five cities in widely separated States given to thousands of men and women in the twenty to forty age group have developed some important information regarding physical qualifications that affect driving ability.

Outstanding is the fact that the female of the species is losing ground as a holder of "better driving" honors and the tests indicate that her superiority at the wheel is only a legend.

Men as a whole have better vision, all-important in good driving, but feminine supremacy is maintained in certain fields of vision. The man at the wheel is quicker to spot a friend a block away, but had better be careful in signaling for a "night out" if the wife is along, because women are more alert in the traditional practice of seeing from the corner of the eye. Women are more apt to see a car approaching from the side.

Women Spot Colors Quicker

The only other point on which women scored was in ability to better distinguish colors. They are quicker to spot a green light when the way is clear. More men tend to have a dominant eye, which might explain that "look where you are going" call on the highways.

Men are not as easily blinded by glare and recover more quickly from blurred vision caused by glaring lights. This is particularly important in night driving.

The average man tested required 5.55 seconds to recover from a bright light, while the average woman required 7.47 seconds.

Men's Hearing More Accurate

Men as a rule hear better than women, are not as much affected by sudden noise and are better able to concentrate on the job at hand. Here is evidence that men are freer from emotional instability, a scoring point in driver qualifications.

Men react more quickly to emergencies and are better judges of distance, the latter of great importance in passing other vehicles and in parking. For example, in a test with a different reaction required for each of three signals coming unexpectedly, the driver not knowing which would come next, the average time for men was .573 seconds and for women .605 seconds.

This difference would mean that traveling at sixty miles per hour the average woman would go three feet further than the average man before she got her foot on the brake.

The variation between men and women in judging distance was not so great. Men would misjudge distance equivalent to thirty-seven feet on the highway, while the average woman would misjudge the distance thirty-eight and a half feet.

It must be conceded that through common sense and natural caution women drivers unquestionably offset the advantages shown by men drivers in the tests, which would account for their general record for good driving. But this is an article on the tests alone and does not allow for other advantages or disadvantages. Science works only on the facts at hand.

Slight Edge For the Men

It was apparent from the tests records that women can rightly point to some advantages, for they claimed to drive on the average 44.7 miles per hour, while the men claimed to drive an average of 47.4 miles per hour on the open road. Women say they drive only about half as many miles per year as men, the latter claiming to drive on the average 15,790 miles annually.

Experience at the wheel is another factor. All results indicated that men learn to drive at a slightly younger age than women. For the age group considered, the average man had been driving 11.3 years and the average woman 10.1 years.

Tests Held in 35 Cities

Putting all the results together, however, it would seem that the men have a slight edge on the women as far as physical characteristics measured by the driver tests are concerned. In some instances the differences are small; the large number of records studied make it quite probable that the results are quite typical of men and women drivers in general.

Drivers in THIRTY-FIVE CITIES in WIDELY SCATTERED STATES were tested with the scientific apparatus developed by leaders in the field of driver testing and assembled as a mobile unit by the American Automobile Association.

Approximately a year has been required to make the tests and study the records of drivers.

Tests Helpful In Many Ways

These records offer valuable experience data for traffic specialists and engineers concerned with traffic safety, which will be helpful in studying driver characteristics. It brings much nearer the day when the driver problem can be solved.

And whatever may be shown that has a bearing on the age-old controversy between man and woman over their respective superiorities at the wheel, the tests are a serious business, representing the newest aid of science in the effort to help bring about better driving conditions.

Introduction

The NIH traces its roots to 1887, when a one-room laboratory was created within the Marine Hospital Service (MHS), predecessor agency to the U.S. Public Health Service (PHS). The MHS had been established in 1798 to provide for the medical care of merchant seamen. One clerk in the Treasury Department collected twenty cents per month from the wages of each seaman to cover costs at a series of contract hospitals. In the 1880s, the MHS had been charged by Congress with examining passengers on arriving ships for clinical signs of infectious diseases, especially for the dreaded diseases cholera and yellow fever, in order to prevent epidemics. During the 1870s and 1880s, moreover, scientists in Europe presented compelling evidence that microscopic organisms were the causes of several infectious diseases. In 1884, for example, Koch described a comma-shaped bacterium as the cause of cholera.

Officials of the MHS followed these developments with great interest. In 1887, they authorized Joseph J. Kinyoun, a young MHS physician trained in the new bacteriological methods, to set up a one-room laboratory in the Marine Hospital at Stapleton, Staten Island, New York. Kinyoun called this facility a "laboratory of hygiene" in imitation of German facilities and to indicate that the laboratory's purpose was to serve the public's health. Within a few months, Kinyoun had identified the cholera bacillus in suspicious cases and used his Zeiss microscope to demonstrate it to his colleagues as confirmation of their clinical diagnoses. "As the symptoms . . . were by no means well defined," he wrote, "the examinations were confirmatory evidence of the value of bacteria cultivation as a means of positive diagnosis."

The move to Washington

In 1891, the Hygienic Laboratory, as it came to be called, was moved to Washington, D.C., near the U.S. Capitol. For the next decade, Kinyoun remained the sole full-time staff member. He inaugurated a training program in bacteriology for MHS officers and conducted numerous tests of water purity and air pollution for the District of Columbia and the Congress. In 1901, the laboratory was belatedly recognized in law when Congress authorized $35,000 for construction of a new building in which the laboratory could investigate "infectious and contagious diseases and matters pertaining to the public health." Occupied in 1904, this building was located at 25th and E Streets, N. W., in Washington, D.C. The founding legislation for the NIH, therefore, resides in a routine supplemental appropriations act. Many other scientific agencies of the federal government were also created via "money bills." Congress was not convinced that such bureaucracies would prove demonstratively useful, so it chose to preserve the option of divesting the government of them simply by not renewing their funding.

In 1902 two acts contributed significantly to the emergence of the Hygienic Laboratory as a center for research within the federal government. The first reorganized the MHS and renamed it the Public Health and Marine Hospital Service (PH-MHS), moving it toward its status as the chief U.S. public health agency. More importantly for the Hygienic Laboratory, the act launched a formal program of research by designating the pathological and bacteriological work as the Division of Pathology and Bacteriology and by creating three new components that represented the most fruitful areas for research at that time: the Divisions of Chemistry, Pharmacology, and Zoology. The importance of these new programs was underscored by the provision that the PH-MHS could hire scientist researchers with Ph.D.'s to head them. Up until this time, the professional staff had been limited to physicians.

Biologics

The Biologics Control Act was a second piece of legislation enacted in 1902 that had major consequences for the Hygienic Laboratory. It charged the laboratory with regulating the production of vaccines and antitoxins, thus making it a regulatory agency four years before passage of the better-known 1906 Pure Food and Drugs Act. The danger posed by biological products-technologies that had emerged from bacteriologic discoveries—resulted from their production in animals and their administration by injection. Diphtheria antitoxin, for example, was made by inoculating horses with increasingly concentrated doses of diphtheria bacteria, then bleeding the animals to obtain their blood serum, which was bottled as antitoxin. When injected into the body of a patient suffering from diphtheria, the antibodies in the horse serum neutralized the toxin causing the patient's symptoms. Possibilities for contamination lurked at every stage of the antitoxin production process, and the amount of horse serum necessary to cure was initially undefined. In 1901, thirteen children in St. Louis died after receiving diphtheria antitoxin contaminated with tetanus spores. This tragedy spurred Congress into passing the Biologics Control Act. Between 1903 and 1907 standards were established and licenses issued to pharmaceutical firms for making smallpox and rabies vaccines, diphtheria and tetanus antitoxins, various other antibacterial antisera, thyroidectomized goat serum, and horse serum. The research required to set standards led investigators into new fields, such as immunology, in order to understand the sudden deaths that sometimes followed repeated injections of biologics prepared in foreign-protein media such as horse serum. (Note: In 1972, responsibility for regulation of biologics was transferred to the Food and Drug Administration.)

Drug Administration.)

In 1912 another Service reorganization act shortened the name of the PH-MHS to Public Health Service (PHS). This brief act also authorized the laboratory to conduct research into non contagious diseases and into the pollution of streams and lakes in the United States. Under this law, PHS officer Joseph Goldberger in 1914 conducted an epidemiological study that identified the cause of the disease pellagra, a scourge of poor Southerners, as a dietary deficiency and brewers' yeast as a cheap and widely available cure. Also, Earl B. Phelps, then director of the Division of Chemistry, described the behavior of oxygen in water that fostered better understanding of the effects of pollution in lakes and rivers.

WWI and the Ransdell Act of 1930

During World War I, the Public Health Service attended primarily to sanitation of areas around military bases in the U.S. The staff of the Hygienic Laboratory traced the cause of anthrax outbreaks among the troops to contaminated shaving brushes and discovered that the bunion pads widely used to cover smallpox vaccinations could harbor tetanus spores. In 1916, the director of the laboratory, Dr. George McCoy , hired the laboratory's first female bacteriologist, Dr. Ida Bengtson. When the 1918 influenza pandemic struck Washington, physicians from the laboratory were pressed into service treating patients in the District of Columbia because so many local doctors fell ill.

In 1930, the Ransdell Act changed the name of the Hygienic Laboratory to National Institute (singular) of Health (NIH) and authorized the establishment of fellowships for research into basic biological and medical problems. The roots of this act extended to 1918, when chemists who had worked with the Chemical Warfare Service in World War I sought to establish an institute in the private sector to apply fundamental knowledge in chemistry to problems of medicine. In 1926, after no philanthropic patron could be found to endow such an institute, the proponents joined with Louisiana Senator Joseph E. Ransdell to seek federal sponsorship. **The truncated form in which the bill was finally enacted in 1930 reflected the harsh economic realities imposed by the Great Depression. Nonetheless, this legislation marked a change in the attitude of the U.S. scientific community toward public funding of medical researc**h.

NCI

Seven years later, the National Cancer Institute (NCI) was created with sponsorship from every Senator in Congress. This unusual agreement among lawmakers revealed growing concern in the nation about cancer and foreshadowed the categorical-disease structure of NIH that has characterized the agency since that time. The NCI was authorized to award grants to nonfederal scientists for research on cancer and to fund fellowships at NCI for young researchers. Under the original legislation, NCI's administrative relationship to NIH was not specified. **A research facility was constructed, however, as "Building 6" of a new NIH campus in Bethesda, Maryland, that was occupied between 1938 and 1941. In the 1944 PHS legislation, NCI was specifically designated as a component of NIH**.

During World War II, the NIH focused almost entirely on war-related problems. At the outset, a Division of Public Health Methods worked with the Selective Service to analyze why 43 percent of potential inductees were unfit for general military service and 28 percent were unfit for any military service. The most common cause of rejection, it was found, was defective teeth. Many of those rejected also had syphilis. **The Division of Industrial Hygiene collaborated with the Divisions of Pathology and Pharmacology to conduct research on hazardous substances and conditions to protect workers in war industries. The investigators examined new explosives, developed methods to determine the amount of lead or TNT in urine so that workers could be tested for undue exposure, and demonstrated the affinity of lead for bone tissue. Other investigators determined that the vapors of methyl, ethyl, isopropyl, and butyl alcohol were acutely toxic to workers.** This work improved conditions of employment for more than 300,000 workers in defense industries.

World War II Research and the Grants Program

Vaccines and therapies to deal with tropical diseases were also critically important to the war effort. At the NIH's Rocky Mountain Laboratory in Hamilton, Montana, yellow fever and typhus vaccines were prepared for military forces. In Bethesda as well as through grants to investigators at universities a synthetic substitute for quinine was sought to treat malaria. The Division of Biologics investigated the fever-producing properties of bacteria which might appear as contaminants of plasma, serum albumin, or whole blood, and developed sampling techniques to avoid contamination. Research in the Division of Chemotherapy revealed that sodium deficiency was the critical element leading to death after burns or traumatic shock. This led to the widespread use of oral saline therapy as a first-aid measure on the battlefield. NIH and military physiologists collaborated on research into problems related to high altitude flying. They determined the altitude at which oxygen had to be administered to prevent pilots from blacking out and designed an apparatus to supply extra oxygen efficiently. They also studied the relation of pressure changes to bubble formation in liquids to address the problem of emboli forming in the blood of pilots. Other tests were made to evaluate the efficiency of flight clothing, especially electrically heated suits, and to determine the effect of altitude on visual acuity and the use of visual devices for improvement of night vision.

As the war drew to a close, PHS officials guided through Congress the 1944 Public Health Service Act, which defined the shape of medical research in the post-war world. Two provisions in particular had an impact on the NIH. First, in 1946 the successful grants program of the NCI was expanded to the entire NIH. From just over $4 million in 1947, the program grew to more than $100 million in 1957 and to $1 billion in 1974. The entire NIH budget expanded from $8 million in 1947 to more than $1 billion in 1966. Between 1955 and 1968, NIH Director James A. Shannon presided over the spectacular growth that is now fondly remembered as "the golden years" of NIH expansion.

New Institutes

Accompanying growth in the grants program was the proliferation of new categorical institutes. Between 1946 and 1949, voluntary health organizations motivated Congress to create institutes for research on mental health, dental diseases, and heart disease. In 1948, language in the National Heart Act also made the name of the umbrella organization plural: National Institutes of Health. The original divisions of the old National Institute of Health were divided into two newly created institutes: the National Microbiological Institute (NMI) and the Experimental Biology and Medicine Institute (EMBI). The tradition of using such academic medical names, however, was being transformed by the conviction that institutes named after diseases stood a better chance for being funded by Congress. In 1950, the EMBI was absorbed by the newly created National Institute of Arthritis and Metabolic Diseases. In 1955 the NMI similarly became part of the National Institute of Allergy and Infectious Diseases. By 1960 there were ten components. This number increased by 1970 to 15, and by 1998 the NIH had 27 institutes and centers.

In addition, specialized offices such as the Office of AIDS Research, were created but subsumed administratively under existing components.

The Clinical Center

The second key provision of the 1944 Public Health Service Act authorized the National Institute of Health to conduct clinical research. After the war, Congress provided funding to build a research hospital, now called the Warren Grant Magnuson Clinical Center, on the NIH campus in Bethesda. Opened in 1953 with 540 beds, the hospital was designed to bring research laboratories into close proximity with hospital wards in order to promote productive collaboration between laboratory scientists and clinicians. Special care was taken to communicate to local physicians that the Clinical Center dealt only with research and did not represent a move toward "socialized medicine," which was opposed by most physicians in the 1950s. The Clinical Center was also launched under the shadow of revelations about Nazi medical experiments during World War II, thus a medical board was charged with reviewing research protocols to ensure that participants would not be harmed. During the 1960s institutions receiving NIH grant awards were required to state the ethical principles guiding their research involving humans. In 1979, the oversight process was codified into written guidelines for research on human subjects. The NIH Office for Protection from Research Risks, utilizing a computerized tracking system, now monitors over 500 major institutions and more than 5,000 smaller institutions, community hospitals, and clinics where research is conducted.

Any research protocol raises ethical uses about the treatment of research subjects, whether human or animal. Since its inception in 1887, the NIH has maintained the necessity for animal research and simultaneously has insisted upon humane treatment. "Animals are to be used in the proper work of the laboratory," wrote Hygienic laboratory director Dr. Milton J. Rosenau in 1904, but anything which inflicts pain upon them will not under any circumstances be allowed." In 1963 the NIH issued a guide for the care and use of laboratory animals that has gone through many editions and is considered a standard reference for scientific institutions. During the early 1970s, an official policy regarding the humane use of animals introduced the concept of institutional animal care committees for those institutions receiving NIH funds. In 1975 members of "study sections," the scientific peers of grant applicants who judge the scientific potential of each application, were assigned the responsibility of considering animal welfare in proposed projects before funds were awarded. Since 1985, NIH officials have conducted unannounced site visits to spot-check animal facilities and laboratory research programs.

Expansion

Toward the end of the 1960s, the growth of NIH budgets slowed considerably, in part because of inflation in the U.S. economy and the advent of new programs such as Medicare and Medicaid that competed for congressional "health" funding. Tighter budgets also led to debate over the relative efficacy of unfettered basic research versus goal-directed applied research. In the early 1970s Congress authorized major initiatives against two chronic killers, cancer and heart disease. The National Cancer Act of 1971 created fifteen new research, training, and demonstration cancer centers. The following year the National Heart, Blood Vessel, Lung, and Blood Act mandated an expanded program against all aspects of heart disease, including high blood pressure, elevated cholesterol levels, stroke, and particular blood diseases such as sickle-cell anemia. The AIDS crisis of the 1980s similarly provided at first an opportunity for goal-directed research quickly to uncover an effective therapy or vaccine. When no quick solution was forthcoming, leaders of the research effort against AIDS began to emphasize study of basic immunological processes as the most efficient strategy to find an effective therapy or preventative.

Thorny social and ethical issues were also raised in the 1970s by the first recombinant DNA experiments. Dr. DeWitt Stetten, Jr., then the NIH Deputy Director for Science, chaired a national committee of scientists to develop guidelines for the new technology. Intramural investigators associated with the National Institute of Allergy and Infectious Diseases conducted biosafety studies which helped to demonstrate that recombinant DNA research did not pose great risk of unleashing deadly novel organisms. Since that time, research on the molecular level has transformed the way scientists study most diseases. In the late 1980s, NIH and the Department of Energy launched the Human Genome Project with the goal of mapping and sequencing the entire collection of human genes. The medical, ethical, and legal implications of this work continue to have profound effects on society.

National Institute of Health Centers

Research in medicine knows no international boundaries. Since its founding, the NIH has maintained close relations with many of its Western Hemisphere counterparts through the Pan American Sanitary Bureau, now called the Pan American Health Organization . In 1947, the first NIH grants were awarded to investigators in foreign universities, and in 1968, the creation of the John E. Fogarty International Center institutionalized coordination of international exchanges at NIH. The Fogarty Center also maintains liaisons with the World Health Organization and European medical research organizations. One branch of the center supports translation, documentation, and critical reviews of new health science information.

Worldwide biomedical communications are also fostered by the NIH's National Library of Medicine (NLM) . As the world's largest medical library, the NLM boasts a collection of more than 5.1 million items. Founded in 1836 as the library of the surgeon general of the Army, the NLM became a component of NIH in 1968. The NLM has made freely available on the World Wide Web a database holding the most current medical literature. Also available are LocatorPlus, the online catalog of books and manuscripts in the library, AIDSLINE, a subset of MEDLINE devoted to AIDS research, and various databases useful for researchers, practicing physicians, and members of the public who use the resources available for research on medical topics.

Biomedical Research

The close relationship between basic and clinical research at the NIH reflects Louis Pasteur's observation that science is indivisible: "There is only science and the fruits of science." On the NIH campus, intramural clinical investigators interact with their basic science colleagues with the aim of developing improved intervention strategies for treating the knottiest disease problems. The NIH also holds Consensus Development Conferences of investigators and physicians from around the world at which panels of experts appraise new modes of therapy or evaluate existing therapies about which questions have been raised. The first, held in 1977, recommended mammography as a routine diagnostic tool for breast cancer in women over fifty. Since then more than 100 Consensus Development Conferences have rapidly channeled research findings on devices, drugs, and medical or surgical procedures to practicing physicians.

Biomedical research and development is a continuing process. New knowledge yields new drugs, devices, and procedures; the study of how the products act yields more knowledge; refinements in knowledge then enable the development of even better therapies. Whether an idea originates in a university laboratory or starts with basic product research carried out in the private sector, important findings percolate through the entire scientific community. Each new finding serves as a building block for establishing a deeper understanding of human health and disease. The 1986 Technology Transfer Act codified and fostered partnerships between NIH research and private-sector development of therapeutic products.

NIH Successes

It is impossible to list all of the discoveries made by NIH-supported investigators. More than eighty Nobel prizes have been awarded for NIH-supported research. Five of these prizes were awarded to investigators in the NIH intramural programs. The intramural discoveries have included deciphering the genetic code that governs all life processes, demonstrating how chemicals act to transmit electrical signals between nerve cells, and describing the relationship between the chemical composition of proteins and how they fold into biologically active conformations. In turn, these basic research discoveries

have led to greater understanding of genetically based diseases, to better antidepressants, and to drugs specially designed to target proteins involved in particular disease processes. Long-term research has dispelled preconceptions that morbidity and dementia are a normal part of the aging process. Some cancers have been cured and deaths from heart attack and stroke have been significantly lowered. Research has also revealed that preventive strategies such as a balanced diet, an exercise program, and not smoking can reduce the need for therapeutic interventions and thus save money otherwise expended for health care.

In 1887, Dr. Joseph Kinyoun could hardly have imagined the size and scope of the NIH's present program. As a result of the numerous scientific opportunities and policy decisions that make up the historical fabric of the NIH, this premier medical research institution is poised to foster even more significant contributions to human health in the twenty-first century.

https://en.wikipedia.org/wiki/National_Institutes_of_Health

The **National Institutes of Health** (**NIH**) (/ɛnaɪ eɪtʃ/; each letter separately) is the primary agency of the United States government responsible for biomedical and public health research. It was founded in the late 1870s, and is now part of the United States Department of Health and Human Services. The majority of NIH facilities are located in Bethesda, Maryland. The NIH conducts its own scientific research through its Intramural Research Program (IRP) and provides major biomedical research funding to non-NIH research facilities through its Extramural Research Program.

As of 2013, the Intramural Research Program (IRP) had 1,200 principal investigators and more than 4,000 postdoctoral fellows in basic, translational, and clinical research, being the largest biomedical research institution in the world,[5] while, as of 2003, the extramural arm provided 28% of biomedical research funding spent annually in the U.S., or about US$26.4 billion.[6]

The NIH comprises 27 separate institutes and centers of different biomedical disciplines and is responsible for many scientific accomplishments, including the discovery of fluoride to prevent tooth decay, the use of lithium to manage bipolar disorder, and the creation of vaccines against hepatitis, *Haemophilus influenzae* (HIB), and human papillomavirus (HPV).[7]

In 2019, the NIH was ranked #2 in the world for biomedical sciences by the Nature Index, which measured the largest contributors to papers published in a subset of leading journals from 2015–2018.[8][9]

History[edit]

Ida A. Bengtson, a bacteriologistwho in 1916 was the first woman hired to work in the Hygienic Laboratory.[10]

Dedication of first six NIH buildings by President Franklin D. Roosevelt in 1940

NIH campus in Bethesda, Maryland, in 1945

NIH's roots extend back to the Marine Hospital Service in the late 1790s that provided medical relief to sick and disabled men in the U.S. Navy. By 1870, a network of marine hospitals had developed and was placed under the charge of a medical officer within the Bureau of the Treasury Department. In the late 1870s, Congress allocated funds to investigate the causes of epidemics like cholera and yellow fever, and it created the National Board of Health, making medical research an official government initiative.[11]

In 1887, a laboratory for the study of bacteria, the Hygienic Laboratory, was established at the Marine Hospital in New York.[12][13] In the early 1900s, Congress began appropriating funds for the Marine Hospital Service. By 1922, this organization changed its name to Public Health Services and established a Special Cancer Investigations laboratory at Harvard Medical School. This marked the beginning of a partnership with universities. In 1930, the Hygienic Laboratory was re-designated as the National Institute of Health by the Ransdell Act, and was given $750,000 to construct two NIH buildings. Over the next few decades, Congress would markedly increase funding of the NIH, and various institutes and centers within the NIH were created for specific research programs.[14] In 1944, the Public Health Service Act was approved, and the National Cancer Institute became a division of NIH. In 1948, the name changed from National Institute of Health to National Institutes of Health.

In the 1960s, virologist and cancer researcher Chester M. Southam injected HeLa cancer cells into patients at the Jewish Chronic Disease Hospital.[15]:130When three doctors resigned after refusing to inject patients without their consent, the experiment gained considerable media attention.[15]:133 The NIH was a major source of funding for Southam's research and had required all research involving human subjects to obtain their consent prior to any experimentation.[15]:135 Upon investigating all of their grantee institutions, the NIH discovered that the majority of them did not protect the rights of human subjects. From then on, the NIH has required all grantee institutions to approve any research proposals involving human experimentation with review boards.[15]:135

In 1967, the Division of Regional Medical Programs was created to administer grants for research for heart disease, cancer, and strokes. That same year, the NIH director lobbied the White House for increased federal funding in order to increase research and the speed with which health benefits could be brought to the people. An advisory committee was formed to oversee further development of the NIH and its research programs. By 1971 cancer research was in full force and President Nixon signed the National Cancer Act, initiating a National Cancer Program, President's Cancer Panel, National Cancer Advisory Board, and 15 new research, training, and demonstration centers.[16]

Funding for the NIH has often been a source of contention in Congress, serving as a proxy for the political currents of the time. In 1992, the NIH encompassed nearly 1 percent of the federal government's operating budget and controlled more than 50 percent of all funding for health research, and 85 percent of all funding for health studies in universities.[17] While government funding for research in other disciplines has been increasing at a rate similar to inflation since the 1970s, research funding for the NIH nearly tripled through the 1990s and early 2000s, but has remained relatively stagnant since then.[18]

By the 1990s, the NIH committee focus had shifted to DNA research, and launched the Human Genome Project.[19]

Leadership[edit]

The NIH **Office of the Director** is the central office responsible for setting policy for NIH, and for planning, managing and coordinating the programs and activities of all NIH components. The NIH Director plays an active role in shaping the agency's activities and outlook. The Director is responsible for providing leadership to the Institutes and Centers by identifying needs and opportunities, especially in efforts involving multiple Institutes.[20] Within this Office is the Division of Program Coordination, Planning and Strategic Initiatives with 12 divisions including:

- Office of AIDS Research
- Office of Research on Women's Health
- Office of Disease Prevention
- Sexual and Gender Minority Research Office
- Tribal Heath Research Office
- Office of Program Evaluation and Performance

Locations and campuses[edit]

Intramural research is primarily conducted at the main campus in Bethesda, Maryland and Rockville, Maryland, and the surrounding communities.

The Bayview Campus in Baltimore, Maryland houses the research programs of the National Institute on Aging, National Institute on Drug Abuse, and National Human Genome Research Institute with nearly 1,000 scientists and support staff.[21] The Frederick National Laboratory in Frederick, MD and the nearby Riverside Research Park, houses many components of the National Cancer Institute, including the Center for Cancer Research, Office of Scientific Operations, Management Operations Support Branch, the division of Cancer Epidemiology and Genetics and the division of Cancer Treatment and Diagnosis.[22]

The National Institute of Environmental Health Sciences is located in the Research Triangle region of North Carolina.

Other ICs have satellite locations in addition to operations at the main campus. The National Institute of Allergy and Infectious Diseases maintains its Rocky Mountain Labs in Hamilton, Montana,[23]with an emphasis on BSL3 and BSL4 laboratory work. NIDKK operates the Phoenix Epidemiology and Clinical Research Branch in Phoenix, AZ.

Research[edit]

Clinical Center – Building 10

As of 2017, 153 scientists receiving financial support from the NIH have been awarded a Nobel Prize and 195 have been awarded a Lasker Award.[24]

Intramural and extramural research[edit]

NIH devotes 10% of its funding to research within its own facilities (intramural research), and gives >80% of its funding in research grants to extramural (outside) researchers.[2] Of this extramural funding, a certain percentage (2.8% in 2014) must be granted to small businesses under the SBIR/STTRprogram.[25] As of 2011, the extramural funding consisted of about 50,000 grants to more than 325,000 researchers at more than 3000 institutions.[26] By 2018, this rate of granting remained reasonably steady, at 47,000 grants to 2,700 organizations.[2] In FY 2010, NIH spent US$10.7bn (not including temporary funding from the American Recovery and Reinvestment Act of 2009) on clinical research, US$7.4bn on genetics-related research, US$6.0bn on prevention research, US$5.8bn on cancer, and US$5.7bn on biotechnology.[27]

Public Access Policy[edit]

Main article: NIH Public Access Policy

In 2008 a Congressional mandate called for investigators funded by the NIH to submit an electronic version of their final manuscripts to the National Library of Medicine's research repository, PubMed Central (PMC), no later than 12 months after the official date of publication.[28] The NIH Public Access Policy was the first public access mandate for a U.S. public funding agency.[29]

NIH Interagency Pain Research Coordinating Committee[edit]

On February 13, 2012, the National Institutes of Health (NIH) announced a new group of individuals assigned to research pain. This committee is composed of researchers from different organizations and will focus to "coordinate pain research activities across the federal government with the goals of stimulating pain research collaboration… and providing an important avenue for public involvement" ("Members of new," 2012). With a committee such as this research will not be conducted by each individual organization or person but instead a collaborating group which will increase the information available. With this hopefully more pain management will be available including techniques for arthritis sufferers.[30]

Economic return[edit]

In 2000, the Joint Economic Committee of Congress reported NIH research, which was funded at $16 billion a year in 2000, that some econometric studies had given a rate of return of 25 to 40 percent per year by reducing the economic cost of illness in the US. It found that of the 21 drugs with the highest therapeutic impact on society introduced between 1965 and 1992, public funding was "instrumental" for 15.[31] As of 2011 NIH-supported research helped to discover 153 new FDA-approved drugs, vaccines, and new indications for drugs in the 40 years prior.[32] One study found NIH funding aided either directly or indirectly in developing the drugs or drug targets for all of the 210 FDA-approved drugs from 2010 to 2016.[33] In 2015, Pierre Azoulay et al. estimated $10 million invested in research generated two to three new patents.[34]

Notable discoveries and developments[edit]

Since its inception, the NIH intramural research program has been a source of many pivotal scientific and medical discoveries. Some of these include:

- 1908 – George W. McCoy's discovery that rodents were a reservoir of bubonic plague.
- 1911 – George W. McCoy, Charles W. Chapin, William B. Wherry, and B. H. Lamb described the previously-unknown tularemia.
- 1924 – Roscoe R. Spencer and Ralph R. Parker developed a vaccine against Rocky Mountain spotted fever.
- 1930 – Sanford M. Rosenthal developed a treatment for mercury poisoning used widely before the development of dimercaptoethanol.
- 1943 – Wilton R. Earle pioneered the cell culture process and published a paper describing the production of malignancy in vitro, Katherine K. Sanford developed the first clone from an isolated cancer cell, and Virginia J. Evans devised a medium that supported growth of cells in vitro.
- 1940s-50s – Bernard Horecker and colleagues described the pentose phosphate pathway.
- 1950s – Julius Axelrod discovered a new class of enzymes, cytochrome P450 monooxygenases, a fundamental of drug metabolism.
- 1950 – Earl Stadtman discovered phosphotransacetylose, elucidating the role of acetyl CoA in fatty acid metabolism.
- 1960s – Discovered the first human slow virus disease, kuru, which is a degenerative, fatal infection of the central nervous system. This discovery of a new mechanism for infectious diseases revolutionized thinking in microbiology and neurology.
- 1960s – Defined the mechanisms that regulate noradrenaline, one of the most important neurotransmitters in the brain.
- 1960s – Developed the first licensed rubella vaccine and the first test for rubella antibodies for large scale testing.
- 1960s – Developed an effective combination drug regimen for Hodgkin's lymphoma.
- 1960s – Discovery that tooth decay is caused by bacteria.
- 1970s – Developed the assay for human chorionic gonadotropin that evolved into the home pregnancy tests.
- 1970s – Described the hormonal cycle involved in menstruation.
- 1980s – Determined the complete structure of the IgE receptor that is involved in allergic reactions.
- 1990s – First trial of gene therapy in humans.

NIH Toolbox[edit]

In September 2006, the NIH Blueprint for Neuroscience Research started a contract for the NIH Toolbox for the Assessment of Neurological and Behavioral Function to develop a set of state-of-the-art measurement tools to enhance collection of data in large cohort studies. Scientists from more than 100 institutions nationwide contributed. In September 2012, the NIH Toolbox was rolled out to the research community. NIH Toolbox assessments are based, where possible, on Item Response Theory and adapted for testing by computer.[*citation needed*]

Funding[edit]

Budget and politics[edit]

Historical NIH budget[35]YearBudget (millions)

To allocate funds, the NIH must first obtain its budget from Congress. This process begins with institute and center (IC) leaders collaborating with scientists to determine the most important and promising research areas within their fields. IC leaders discuss research areas with NIH management who then develops a budget request for continuing projects, new research proposals, and new initiatives from the Director. NIH submits its budget request to the Department of Health and Human Services(HHS), and the HHS considers this request as a portion of its budget. Many adjustments and appeals occur between NIH and HHS before the agency submits NIH's budget request to the Office of Management and Budget (OMB). OMB determines what amounts and research areas are approved for incorporation into the President's final budget. The President then sends NIH's budget request to Congress in February for the next fiscal year's allocations.[36] The House and Senate Appropriations Subcommittees deliberate and by fall, Congress usually appropriates funding. This process takes approximately 18 months before the NIH can allocate any actual funds.[37]

When a government shutdown occurs, the NIH continues to treat people who are already enrolled in clinical trials, but does not start any new clinical trials and does not admit new patients who are not already enrolled in a clinical trial, except for the most critically ill, as determined by the NIH Director.[38][39][40][41]

Historical funding[edit]

Over the last century, the responsibility to allocate funding has shifted from the OD and Advisory Committee to the individual ICs and Congress increasingly set apart funding for particular causes. In the 1970s, Congress began to earmark funds specifically for cancer research, and in the 1980s there was a significant amount allocated for AIDS/HIV research.[42]

Funding for the NIH has often been a source of contention in Congress, serving as a proxy for the political currents of the time. During the 1980s, President Reagan repeatedly tried to cut funding for research, only to see Congress partly restore funding. The political contention over NIH funding slowed the nation's response to the AIDS epidemic; while AIDS was reported in newspaper articles from 1981, no funding was provided for research on the disease. In 1984 National Cancer Institute scientists found implications that "variants of a human cancer virus called HTLV-III are the primary cause of acquired immunodeficiency syndrome (AIDS)," a new epidemic that gripped the nation.[43]

In 1992, the NIH encompassed nearly 1 percent of the federal government's operating budget and controlled more than 50 percent of all funding for health research and 85 percent of all funding for health studies in universities.[17] From 1993 to 2001 the NIH budget doubled. Since then, funding essentially remained flat, and during the decade following the financial crisis, the NIH budget struggled to keep up with inflation.[44]

In 1999 Congress increased the NIH's budget by $2.3 billion[42] to $17.2 billion in 2000.[45] In 2009 Congress again increased the NIH budget to $31 billion in 2010.[45] In 2017 and 2018, Congress passed laws with bipartisan support that substantially increasing appropriations for NIH, which was 37.3 billion dollars annually in FY2018.[46][47]

Extramural research[edit]

Main article: NIH grant

Researchers at universities or other institutions outside of NIH can apply for research project grants (RPGs) from the NIH. There are numerous funding

mechanisms for different project types (e.g., basic research, clinical research etc.) and career stages (e.g., early career, postdoc fellowships etc.). The NIH regularly issues "requests for applications" (RFAs), e.g., on specific programmatic priorities or timely medical problems (such as Zika virus research in early 2016). In addition, researchers can apply for "investigator-initiated grants" whose subject is determined by the scientist.

The total number of applicants has increased substantially, from about 60,000 investigators who had applied during the period from 1999 to 2003 to slightly less than 90,000 in who had applied during the period from 2011 to 2015.[48] Due to this, the "cumulative investigator rate," that is, the likelihood that unique investigators are funded over a 5-year window, has declined from 43% to 31%.[48]

R01 grants are the most common funding mechanism and include investigator-initiated projects. The roughly 27,000 to 29,000 R01 applications had a funding success of 17-19% during 2012 though 2014. Similarly, the 13,000 to 14,000 R21 applications had a funding success of 13-14% during the same period.[49] In FY 2016, the total number of grant applications received by the NIH was 54,220, with approximately 19% being awarded funding.[50] Institutes have varying funding rates. The National Cancer Institute awarded funding to 12% of applicants, while the National Institute for General Medical Science awarded funding to 30% of applicants.[50]

Funding criteria[edit]

NIH employs five broad decision criteria in its funding policy. First, ensure the highest quality of scientific research by employing an arduous peer review process. Second, seize opportunities that have the greatest potential to yield new knowledge and that will lead to better prevention and treatment of disease. Third, maintain a diverse research portfolio in order to capitalize on major discoveries in a variety of fields such as cell biology, genetics, physics, engineering, and computer science. Fourth, address public health needs according to the disease burden (e.g., prevalence and mortality). And fifth, construct and support the scientific infrastructure (e.g., well-equipped laboratories and safe research facilities) necessary to conduct research.[51]

Advisory committee members advise the Institute on policy and procedures affecting the external research programs and provide a second level of review for all grant and cooperative agreement applications considered by the Institute for funding.[52]

Gender and sex bias[edit]

In 2014, it was announced that the NIH is directing scientists to perform their experiments with both female and male animals, or cells derived from females as well as males if they are studying cell cultures, and that the NIH would take the balance of each study design into consideration when awarding grants.[53] The announcement also stated that this rule would probably not apply when studying sex-specific diseases (for example, ovarian or testicular cancer).[53]

Stakeholders[edit]

General public[edit]

One of the goals of the NIH is to "expand the base in medical and associated sciences in order to ensure a continued high return on the public investment in research."[54] Taxpayer dollars funding NIH are from the taxpayers, making them the primary beneficiaries of advances in research. Thus, the general public is a key stakeholder in the decisions resulting from the NIH funding policy.[55]However, some in the general public do not feel their interests are being represented, and individuals have formed patient advocacy groups to represent their own interests.[56]

Extramural researchers and scientists[edit]

Important stakeholders of the NIH funding policy include researchers and scientists. Extramural researchers differ from intramural researchers in that they are not employed by the NIH but may apply for funding. Throughout the history of the NIH, the amount of funding received has increased, but the proportion to each IC remains relatively constant. The individual ICs then decide who will receive the grant money and how much will be allotted.

Policy changes on who receives funding significantly affects researchers. For example, the NIH has recently attempted to approve more first-time NIH R01 applicants, or the research grant applications of young scientists. To encourage the participation of young scientists, the application process has been shortened and made easier.[57] In addition, first-time applicants are being offered more funding for their research grants than those who have received grants in the past.[58]

Commercial partnerships[edit]

In 2011 and 2012, the Department of Health and Human Services Office of Inspector General published a series of audit reports revealing that throughout the fiscal years 2000–2010, institutes under the aegis of the NIH did not comply with the time and amount requirements specified in appropriations statutes, in awarding federal contracts to commercial partners, committing the federal government to tens of millions of dollars of expenditure ahead of appropriation of funds from Congress.[59]

The NIH Clinical Center is a hospital solely dedicated to clinical research at the National Institutes of Health campus in Bethesda, Maryland. The Clinical Center, known as Building 10, **consists of the original part of the hospital, the Warren Grant Magnuson Clinical Center**, and the newest addition, the Mark O. Hatfield Clinical Research Center. The two parts are connected to form one large building.[1]

Since the hospital's opening in 1953,[2] NIH scientists have worked with volunteer patients to create medical innovations. Clinical Center successes include pioneering the cure of cancerous solid tumors with chemotherapy; the use of nitroglycerin to treat heart attacks; identifying a genetic component in schizophrenia; conducting the first successful replacement of a mitral valve to treat heart disease; and the **creation of blood tests to identify both Acquired Immune Deficiency Syndrome (AIDS) and hepatitis**.[3]

In October 2014, Clinical Center staff successfully treated one of the first few Ebola virus cases in the United States.

The Clinical Center has been a leader in the "bench-to-bedside" concept. Its specialized hospital design places patient care units in close proximity to research laboratories. This model supports interaction and collaboration among clinical researchers.

The Clinical Center also provides training opportunities for students, new and mid-career professionals.[4] A Summer Internship Program offers internships to students who are currently enrolled in high school, college, graduate programs and health professional schools such as nursing or medicine.[5] The Medical Research Scholars Program is a year-long research enrichment program designed for research-oriented medical, dental and veterinary students.[6] The Clinical Research Management Sabbatical is a self-directed educational experience designed for clinical research investigators and managers of clinical research programs.[7] The Clinical Center also provides a course called the Introduction to the Principles and Practice of Clinical Research to train physicians, scientists, medical students, nurses and other health professionals how to effectively conduct clinical research.[8]

History[edit]

The Warren Grant Magnuson Clinical Center opened in 1953 and is 13 floors at its highest point. It is named after Senator [**Warren Grant "Maggie" Magnuson (born 1905)**] of Washington.

The Mark O. Hatfield Clinical Research Center, located at the north end of the Clinical Center, opened in 2005. It was named after Senator Mark O. Hatfield of Oregon.[9]

The hospital has 200 inpatient beds, 11 operating rooms, 93 day hospital stations, critical care services and research labs, an ambulatory care research facility and a complex array of imaging services. The Clinical Center is also one of the few facilities in the world with state-of-the-art infrastructure that allows for isolation capabilities and infection control while patients participate in clinical research studies.[1][10]

Patients at the Clinical Center consent to participate in research studies, also called protocols, and are treated without charge. Admission is selective: only those patients who have a medical condition being studied by NIH Institutes or Centers and who meet the specific inclusion criteria can enroll in the studies. In 2014, there were 1,611 clinical research studies underway at the Clinical Center including those focused on cancer, infectious diseases, blood disorders, heart disease, lung disease, alcoholism and drug abuse.[1]

More than 500,000 patients from all 50 states, and from countries around the world, have participated in clinical research at the Clinical Center.[1]

Dr. John I. Gallin served as director of the Clinical Center beginning in May 1994. In January 2017, as part of an update to the hospital's leadership structure, NIH Director [**Dr. Francis Sellers Collins (born 1950)**] named Dr. James K. Gilman to the newly created position of chief executive officer Clinical Center. With the arrival of Dr. Gilman, Dr. Gallin assumed new roles as the NIH Associate Director for Clinical Research and Chief Scientific Officer, Clinical Center.[11]

Clinical Trials[edit]

In 2014, the NIH Clinical Center had 1,611 active research protocols. 48% of those were clinical trials (773 protocols), another 46% were natural history studies (744 protocols) and the remaining 6% were screening and training protocols.[12]

The Clinical Center provides an environment for both patient care and conducting clinical trials, most of which are in Phase I or Phase II.[1] In 2014, of the 773 active clinical trials protocols, 23% were Phase I trials (261 protocols), 60% were Phase II trials (462 protocols), 5% were Phase III (39 protocols) and 3% were Phase IV (11 protocols).[12]

The Clinical Center also integrates data from all intramural clinical trials in an integrated data repository called Biomedical Translational Research Information System (BTRIS).[13]

Documentary[edit]

The Discovery Channel documentary First In Human: The Trials of Building 10, hosted by Jim Parsons, aired in August 2017.[14] The three-episode documentary showed experiences of some staff, patients and caregivers at the NIH Clinical Center.

Clinical Research Nursing is nursing practice with a specialty focus on clinical research. It includes care provided to research participants, as well as activities to support protocol implementation, data collection and research participant protection. In addition to providing and coordinating clinical care, clinical research nurses have a central role in assuring ongoing maintenance of informed consent, integrity of protocol procedures and accuracy of research data collection.

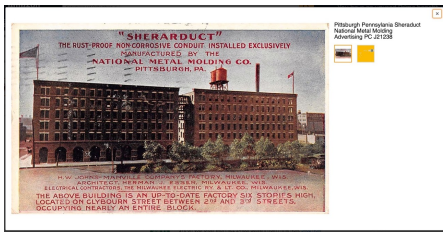
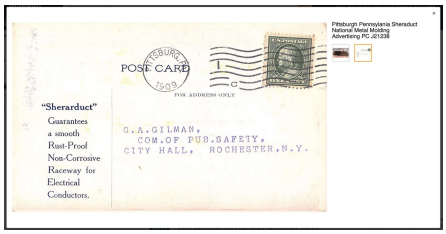
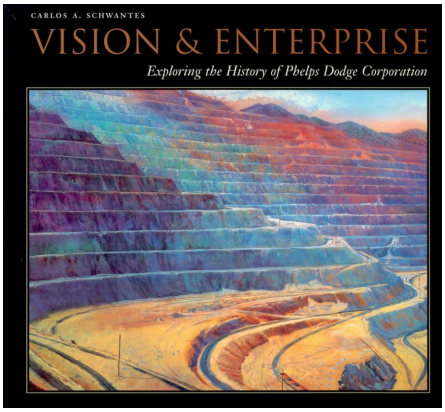
National Metal Moldings Corporation

Here are some postcards of **National Metal Moldings Corp.** advertising major buildings with their *"Sherarduct"* product.





The book ***"Vision & Enterprise: Exploring the History of Phelps Dodge Corporation"*** (By Carlos A. Schwantes) has a reference... apparently a copper consumer? In 1928, the company **National Electric Products Corporation** was formed, and it was ranked among the largest consumers of copper in the world. This company was created from three other companies that came under control because of their dependency on copper - These companies include **William C. Robinson's National Metal Molding Company** in Pittsburgh, the **Habirshaw Cable and Wire Company** in Yonkers, and the **Inca Manufacturing Company** in Fort Wayne.



transportation, so too were its brass condenser tubes to ocean commerce when great and luxurious steamships ruled the waves.

Brown, a Cornell-trained engineer, soon became unhappy because he thought Bridgeport Brass paid him too little; so he transferred to the sales side of the business. During the opening decade of the twentieth century he traveled to every corner of the United States, observing the nation's industrial growth and selling service as well as brass condenser tubes. In this way he came to see that the market for tubes and pipes—unglamorous products, to be sure, but a vital part of the modern infrastructure of the country—offered rich rewards to a man with his knowledge and vast network of business contacts.

In 1914 Brown resigned from Bridgeport Brass, where he was secretary and general manager, and struck out on his own. He was certain he would never attain his goal of becoming a millionaire if he worked for someone else. Not only did he become a supersalesman of the condenser tubing required by many ships built during World War I, but he also formed a new company to supply it. In fact, even before Uncle Sam placed his first orders for the product, Brown organized the British American Tube Company in 1914 and secured machinery and a suitable plant in Plainfield, New Jersey. All during the Great War the factory ran at top speed day and night, and for a time it was the largest producer of condenser tubes in the world.

When the conflict ended, Brown's bank account overflowed. The newfound wealth made him expansion minded. That was the main reason he joined with investors in 1920 to form the American Copper Products Corporation. Next he used the firm's financial clout to buy the Bayway plant of the Wadark Wire Company from the legendary Montanan William Andrews Clark (of United Verde fame), who back in 1897 added the fabricating works to his extensive holdings. Located in an industrial waterfront area called Bayway (later part of Elizabeth, New Jersey), the plant helped to make American Copper Products a major manufacturer of copper wire during the 1920s. Brown served as its vice-president and general manager.

American Copper Products sold copper rod to many customers including the Habirshaw Cable and Wire Company in Yonkers, William C. Robinson's National Metal Molding Company in Pittsburgh, and the Inca Manufacturing Company in Fort Wayne. That was how all three enterprises fell under Brown's spell. The blunt manner in which he approached George Jacobs of Inca was vintage Brown. He asked, "Why the hell don't you sell out. You certainly have enough money." Jacobs, who was contemplating taking more time away from business to spend some of his fast-growing fortune, responded, "Sure thing, if you pay me enough." Obviously he did. Further expanding his manufacturing empire, Brown added a tube mill in Los Angeles to settle a bad debt.[11]

Perhaps Brown alone could sort out the innumerable technical and financial details of his enterprise, which under the inclusive name National Electric Products Corporation (formed in 1928) ranked among the largest consumers of copper in the world. The multimillion-dollar combination of metal fabricators, together with such subsidiary firms as Habirshaw Cable and Wire, produced some two hundred million

Computer simulation firms announce merger

By Michael Dresser
Sun Staff Writer

Three Columbia-based companies and a Swedish firm are joining forces to create an international computer simulation company based in Columbia.

Simulation, Systems and Services Technologies Co., known as S3, agreed Friday to merge with EuroSim AB of Sweden and two Columbia-based units of National Patent Development Corp. to form a new company to be known as Global Simulation and Engineering Systems Inc. (GSE).

The new company, which will be housed in S3's Columbia headquarters, will be headed by S3 Chief Executive William E. Kuhlmann, a former General Physics Corp. president. Mr. Kuhlmann said yesterday that the merging companies now account for annual sales of about $55 million.

"We hope to do a public financing in the fall of this year, probably at the earliest," he said. The merger would help the companies make the transition from a hardware orientation to an emphasis on software, he said.

The existing companies are active in the creation of computer simulations of power generation operations, both for nuclear and fossil fuel plants, and chemical processing. The simulations are used both for training and the development of new procedures in those industries.

The merger of the three companies is not expected to result in any significant job losses, said S3 Vice President Michael Allocco.

S3's Columbia operation will continue to employ about 275 workers, and they will be joined by an estimated 50 to 60 workers from General Physics International Simulation and Engineering Inc. and GPC Simulation Services Division. For the short term, he said, the merging companies will be operated with their current management structure intact.

General Physics International is owned by General Physics Corp. of Columbia, which is itself owned by National Patent Development Corp. of New York. GPC Simulation Services is a General Physics spinoff that is now directly owned by National Patent, which will control three of the seven board seats in GSE.

ManTech International Corp. of Fairfax, Va., which owns S3, will control another three seats, while the Swedish firm will control one.

Sales: $204 million

Stock Exchanges: American

SICs:

National Patent Development Corporation (NPD), incorporated in Delaware in 1959, is primarily a holding company, a legal entity separate and distinct from its various operating subsidiaries. NPD's operations comprise three business segments: Physical Science, Distribution, and Optical Plastics. In addition, National Patent has numerous investments in the domestic health care, biopharmaceutical, and environmental technology industries and holds 54 percent of outstanding shares of common stock in a company distributing pharmaceutical products in Russia.

In 1959, three New York City lawyers, Jerome Feldman, Martin M. Pollak, and Jess Larson, began NPD as a scouting service for dormant patents. Their idea originated in 1958 after Feldman and Pollak heard about a new resin plasticizer developed and put on hold by a company unsure about the product's marketability. The partners believed the resin offered a superior base material for the manufacture of lipstick and they offered to arrange a licensing agreement. Although the partners found a major cosmetics manufacturer, problems arose when each company told them to get their fee from the other.

While the deal ultimately fell through, Feldman and Pollak saw profit potential in the patent exchange business and decided to form a company that could act, under contract, as a middleman. They found a third partner in **Jess Larson, an attorney with considerable government experience, having formerly served as Administrator of the General Services Administration, War Assets Administrator, and Brigadier General in the Air Force Reserve. Larson also saw the possibility of reaping substantial profits developing new commercial products from forgotten patents.**

From the beginning NPD focused on screening and buying patents on various devices, technologies, and materials, and then licensing them to other companies or trying to market the products themselves. To screen the thousands of patents lying idle in corporate files, the partners formed a consulting board consisting of patent lawyers, scientists, and engineers.

National Patent began gaining momentum in 1961, a year before the Cuban Missile Crisis, after Feldman and Pollak wrote a letter to then-Soviet Premier Nikita Khrushchev asking for rights to Soviet inventions. Surprisingly, despite Cold War tensions, the Soviets were willing to deal to obtain American dollars and invited them to visit. After three weeks in Russia, NPD experts screened Soviet developments by conferring with some 250 Russian scientists and technicians and won patent rights to market 14 innovations in the United States. **National Patent then signed an agreement with Amtorg, the U.S.-based Soviet trade wing.**

While some Soviet-acquired innovations proved profitable, others flopped. A surgical stapling device that replaced needle-and-thread suturing earned enough for Feldman to start a medical instrument business. That venture—U.S. Surgical—was later sold off and grew into a multi-million dollar corporation. Unfortunately, most products were far less successful, like an electric eyepad touted as inducing a blissful nap.

Using their Kremlin link, NPD made inquiries in other Communist bloc countries; in Czechoslovakia they met Otto Wichterle, polymer chemist at the Czechoslovak Academy of Sciences. Wichterle devised a novel application for a new plastic compound called Hema, which turned soft and pliable when infused with a liquid. Hema was originally intended for making artificial veins and body organs, but Wichterle found that spinning a droplet of Hema in a thimble-size dish could produce a soft contact lens.

In the West, contact lenses were still produced of hard plastic. By purchasing the spinning technology and the rights to make and market Hema, NPD found its first important product. Nevertheless, for two years the company experimented with the compound, prevented by scarce capital from marketing its new product. Then in 1966 NPD concluded a licensing agreement with Bausch & Lomb of Rochester, New York, a major player in the optical business and well aware of the potential market for soft lenses. The agreement gave Bausch & Lomb exclusive license to the new lens material and Wichterle's spinning and manufacturing technology. In return, NPD would receive a licensing fee plus half of all Bausch & Lomb's domestic lens profits.

After the Bausch & Lomb agreement, Feldman searched for other uses for Hema, which had been trademarked as Hydron. While National Patent licensed the rights to Hydron for contact lenses, it retained rights to use the compound for other applications and to produce new products. The company's labs produced a range of new Hydron-based products, including nail polish, burn-wound dressings, dental root-canal fillers, artificial breasts, and algae-resistant boat paint.

Most promising of all was a reactive chemical that showed potential for dissolving tooth decay, thus replacing drilling. Feldman found the compound at Tufts University, bought the patent rights, and offered the product to Warner-Lambert, which anticipated a use for the product as a plaque-removal agent in mouthwash. NPD's stock shot up from less than $10 in 1971 to $67 a share in 1972, one year after the Food & Drug Administration (FDA) approved Bausch & Lomb's new soft lens.

NPD shareholders' rising expectations proved false when the company's fortunes turned sour. Bausch & Lomb royalties proved disappointing, prompting National Patent to file suit in a protracted legal battle that threatened to end NPD's royalties entirely. Then Warner-Lambert announced that trial tests on schoolchildren showed their new mouthwash to be a failure as a plaque remover. NPD's stock collapsed to just $4 a share in 1973. Responding to these disappointments, Feldman diversified the company into gardening supplies, sporting equipment, solar energy, medical instruments, and contact lenses, planning to make NPD more independent. He also recruited a Russian professor to train company chemists in the production of inter-ferons, a group of proteins produced by the body's immune system to help combat disease. This erratic strategy proved a dismal failure, causing a decade of poor earnings and a blighted reputation for the company. Feldman later recalled this period as the "dark years."

Through the 1970s, National Patent's fortunes rested on a $14 million settlement from Bausch & Lomb. Charles Allen, a world-class deal-maker and founder of Allen & Co., also figured prominently in the company's survival. Allen took Feldman as a client, arranged private infusions of cash, and bought NPD stock even when times appeared bleakest. He soon controlled one of the largest interests in NPD after the combined holdings of Feldman and Pollak. In spite of Allen's help, NPD continued to be plagued by marketing mishaps and technological failures. For example, a malfunction in an intravenous control system forced an expensive recall, and the company fell more than a year behind schedule in developing and marketing a solar energy cell. As a result, Feldman cut corporate staff and sold off NPD's medical equipment and solar energy ventures.

Pollak had better luck with American Hydron, NPD's contact-lens subsidiary. Established in 1979 as International Hydron Corporation to manufacture and

sell contact lenses in the United States, the subsidiary produced its first earnings in 1982. A year later industry leader Bausch & Lomb considered American Hydron its major competitor in the sale of daily-wear soft contacts. Pollak's clever marketing strategy—offering Mercedes-Benzes, videocassette recorders, and gold coins to optometrists who placed large orders—caused the subsidiary's second-year shipments to double.

Despite intense competition, American Hydron fared well in producing high-quality lenses at a low cost. By the end of 1983, the subsidiary unveiled a new, compact, spincast system that could make lenses similar to Bausch & Lomb's most popular line. American Hydron also began testing collagen, a protein produced from cowhide, in an attempt to displace Hydron in low-cost lens production. By 1987, American Hydron was producing contact lenses using three distinct methods—lathing, cast molding, and spincasting, each having its own production and marketing advantages. While lens lathing was labor intensive, it proved superior for specialty lenses and low production. Cast molding maintained high optical lens quality but was more efficient in large-volume production. Spincasting was particularly suited for large-volume manufacture with low labor costs.

At the same time, NPD's Interferon Sciences, Inc. (ISI) subsidiary was moving toward marketing a host of interferon-based treatments for viral diseases. Production problems stemming from inefficiencies in extracting interferon from leukocytes, or white blood cells, were helped by the company's Czech connection. Pollak was vice-chairman of the Czechoslovak-U.S. Economic Council, a bilateral organization formed to promote trade between the two countries. This role introduced him to council chairman Fred Kuhlmann, vice-president of Anheuser-Busch, a St. Louis-based brewery that used Czechoslovakian hops to make beer. Anheuser's advanced fermentation technology for cultivating yeast cells proved to be the solution to the interferon production problem. Through the innovative process of "transformation," DNA molecules containing the genetic code for interferon could be extracted from human white blood cells and inserted into yeast cells, thereby producing interferon on a large scale.

Mutual interest in this process led both companies to embark on a joint production enterprise. ISI would alter individual yeast cells for use by Anheuser to produce billions of offspring. In return for the option of making new interferon products, Anheuser would provide ISI $6 million for research and development. This money aided Interferon Sciences' clinical trials of an interferon ointment for treating genital herpes—which afflicted an estimated 20 million in the United States alone— and allowed the company to begin testing a treatment for genital warts.

Feldman's typical business strategy was to spin off new technological ventures into separate companies while retaining most of their stock. By doing so, he transformed NPD into a holding company benefitted by the rising asset value of satellite companies taken public. In 1981, Feldman spun off ISI into a public company while retaining 75 percent of the shares. Two years later he spun off NPS Waste Technologies, an innovator in particle-glass filtering mechanisms for radioactive waste.

By 1987, NPD essentially operated through various subsidiaries and affiliates as a manufacturer and distributer of a wide array of products and services. The company's operations consisted primarily of four business segments, as well as various research and development programs that were not yet commercially viable. The company's Ophthalmic Products Group produced and marketed soft contact lenses and accessories. The Medical Science Group produced and distributed first aid products, surgical dressings, and various other hospital and medical products primarily through three subsidiaries, Acme Cotton Products, Chaston Medical & Surgical Products, and Abbey Medical, Inc. In addition to its interferon subsidiary, the Medical Group included dental products, such as the Caridex (R) Caries Removal System. An FDA-approved product that showed promise in removing tooth decay without the need for drilling, Caridex was the same failed dental plaque remover that had shown false promise a decade earlier.

NPD's Consumer and Service Group distributed home and garden products, as well as produced paint, paint specialties, coated and molded plastic products, and electronic components through several subsidiaries: J. Levin & Co., Inc., E. Rabinowe & Co., Inc., acquired in 1985, and Interstate Paint Distributors Inc., acquired in 1986**. The Physical Science Group provided training, operations, engineering, and maintenance services to the electrical power industry and the U.S. Navy. In addition, this group also developed, manufactured, and marketed products and services used in the clean-up of low-level radioactive material from waste water at utility-operated nuclear power plants.**

In 1987, NPD sold its interest in both International Hydron and Abbey Medical, Inc., a renter and seller of durable medical equipment. In 1989, the Medical Group introduced a new quick-opening adhesive bandage, STAT STRIP, to the hospital and medical markets. Interferon Sciences (ISI), received FDA approval of its Alferon N Injection, an alpha interferon product derived from human leukocytes developed for the treatment of recurring genital warts in patients 18 years or older. This achievement essentially transformed ISI from a research and development firm into an operating pharmaceutical company. An agreement was made with the Purdue Fredrick Company, a privately owned multinational drug company, to market Alferon N Injections in the United States and abroad. In addition, ISI acquired the worldwide rights from Amarillo Cell Culture for the oral administration of natural interferon, apparently effective in boosting the immune system. In addition, NPD's consumer and service group, collectively known as the Five Star Group, acquired State Leed, a distributor of various paint items. Together these companies, comprising J. Levin, E. Rabinowe, and Interstate Paint Distributors, had become the largest U.S. distributor of paint specialties, including interior and exterior stains, brushes, rollers, and caulking compounds.

By 1995, NPD had developed into three primary business segments: Physical Science, Distribution, and Optical Plastics. The company also had investments in Hydro Med Sciences (HMS), a health care business, and GTS Duratek, Inc., an environmental technology firm, as well as continuing investments in ISI.

The Physical Science Group consisted of SGLG, Inc. (formerly GPS Technologies), of which NPD had a 91 percent controlling interest; and General Physics Corporation, approximately 51 percent owned. General Physics provided numerous services, including personnel training and engineering, environmental, and technical support, to commercial nuclear and power utilities, the U.S. Departments of Defense and Energy, *Fortune* 500 companies, and other commercial and governmental clients. SGLG was a holding company with a 35 percent interest in GSE Systems, a company specializing in simulator software. In 1995 General Physics acquired Cygna Energy Services, a provider of design engineering, materials management, and safety analysis services to the nuclear power industry. General Physics also acquired all of the assets of SGLG, Inc. for approximately $34 million. In response to federal cutbacks in the Departments of Defense and Energy, General Physics began focusing on expanding its management and technical training services as well as specialized engineering services to manufacturers and federal agencies.

Five Star operated as a wholesale distributor of home decorating, hardware, and finishing products. Through the mid-1990s, Five Star remained the largest distributor in the United States of paint products and accessories, caulking compounds, and other items, despite intense competition from considerably larger hardware franchises, including Servistar and True Value.

The Optical Plastics Group operated through NPD's wholly owned subsidiary MXL Industries, a producer of molded and coated optical and non-optical products. MXL also made state-of-the-art injection molding tools, using polycarbonate resin to make shields, face masks, and lenses for over 55 clients in the safety, recreation, and military industries.

NPD's Hydro Med Sciences subsidiary manufactured medical devices, drugs, and cosmetic polymer products. HMS was established to explore the application of HydronR polymers for biomedical purposes. Since the 1970s HMS was involved in the development of human and veterinary drugs and dental

and medical devices. The company developed the Syncro-Mate BR implant for the synchronized breeding of bovine heifers, the first veterinary implant drug to be approved by the FDA. HMS also produced a water-soluble HydronR polymer for commercial applications in cosmetic products, including body lotions, moisturizers, and sunscreens.

ISI, a biopharmaceutical company, continued to be involved principally in the production and sale of Alferon N Injections. In 1995, the product still represented the only FDA-approved drug based on a natural source for the treatment of certain types of genital warts. ISI also explored new applications for its injectable, topical, and oral formulations of natural alpha interferon for the treatment of HIV, hepatitis C, hepatitis B, multiple sclerosis, cancers, and other diseases. In the biomedical industry, various alpha interferon drugs have been approved for 17 different medical uses in more than 60 countries. As a group, sales of these biopharmaceuticals approached $2 billion in 1994. Gaining approval to sell the product in Mexico in the mid-1990s, ISI also sought regulatory approval to market Alferon N Injections in Austria, Canada, Hong Kong, Israel, Singapore, and the United Kingdom.

ISI's other products under development included Alferon N Gel and Alferon LDO. Alferon N Gel, a topical application, had potential for treating cervical dysplasia, recurrent genital herpes, other viral diseases, and cancers. Alferon LDO constituted a low oral dose of liquid alpha interferon, possibly proving beneficial in treating HIV and other viral diseases. These products were undergoing clinical trials during the mid-1990s.

NPD organized its American Drug Company (ADC) subsidiary in 1993 to distribute general Pharmaceuticals and medical products in Russia and the Commonwealth of Independent States (CIS), the former Soviet republic. ADC was formed from NPD Trading (USA), Inc., which had been set up in 1990 to provide consulting services to Western businesses in Russia and Eastern Europe. NPD Trading would continue to operate as a subsidiary of the newly formed ADC, providing a broad range of business services to many American and Western corporations. Through NPD Trading, ADC's various activities involved developing and assisting Western businesses to create trading, manufacturing, and investment opportunities in Russia, the Czech and Slovak Republics, and other countries in Eastern Europe and the CIS. ADC also focused on marketing American-made pharmaceuticals and health care products—antibiotic ointments, pain-relief medication, vitamins, bandages, prescription injectable anti-cancer drugs, antibiotics, and other prescription drugs— under its own label in Russia and the CIS. To distribute these products, ADC initiated marketing ventures with hospitals, pharmacies, and clinics throughout Russia and the CIS.

NPD's interests in environmental technology centered on GTS Duratek, Inc. As of March 1, 1995, NPD decreased its holdings of Duratek's outstanding shares of common stock from 61 to 40 percent. Incorporated in Delaware in December 1982, Duratek's operations comprised two principal groups: the Technology Group converted radioactive and hazardous waste to glass by means of in-furnace vitrification processes, as well as specializing in removing radioactive and hazardous contaminants from waste water through a filtration and ion process. The Services Group provided consulting, engineering, and training services, as well as technical personnel, assistance with nuclear power outages and operations, and Department of Energy environmental restoration projects. As of 1995, major customers for these services included Duke Power Company, Vermont Yankee Nuclear Power Corporation, New York Power Authority, Tennessee Valley Authority, GPU Nuclear Corporation, PECO Energy Company, and FERMCO.

Principal Subsidiaries

GPS Technologies; GTS Duratek, Inc.; General Physics Corporation; Interferon Sciences, Inc.; Five Star Group, Inc.; MXL Industries, Inc.; American Drug Company.

1997 (Sep 22) - Washington Post - "NATIONAL PATENT LOOKS TO LEANER, GREENER TIMES"

By Jerry Knight, September 22, 1997

Source : [HN014P][GDrive]

Washington investors old enough to remember when the stock market sometimes went down as well as up may also recall National Patent Development Corp.

Back in the days when high technology meant pocket calculators, NPD was a hot tech stock. In the 1960s and 1970s the firm made a bundle from its investment in the development of soft contact lenses and another bundle when it financed U.S. Surgical Corp., the pioneer in surgical staples.

But NPD's last big hits were in the early 1980s. Then a $100-a-share-plus stock, it hasn't seen triple digits in more than a decade. The stock, traded on the American Stock Exchange as NPD, sank to a record low of $6.12 1/2 last April but regained altitude over the summer.

At least one Wall Street analyst sees the potential for substantial future gains in the stock of National Patent, which plans to sell half a dozen businesses and concentrate on its primary subsidiary, General Physics Corp. of Columbia.

Since its glory days, NPD has become a major player in the Washington tech community by making investments in three companies, all based in Columbia.

General Physics, best known for training nuclear power plant operators, is owned outright by NPD, which bought out shareholders in January. NPD also owns a 15 percent stake in GTS Duratek Inc., a hazardous-waste disposal firm, and 22 percent of the stock of GSE Systems Inc., a simulation and training software company.

Besides its Washington investments, NPD also owns Five Star Group Inc., a New Jersey distributor of decorative hardware and painting products, and MXL Industries, a Pennsylvania maker of safety glasses. It also holds 15 percent of the stock of Interferon Sciences Inc. a New Jersey biopharmaceutical firm, and 30 percent of Avenue Entertainment, a New York movie production company.

Acquired over the years, none of these companies proved to be a big success, leaving NPD with a conglomeration of second-string players in disparate industries that didn't add up to much as far as Wall Street was concerned.

Five Star and MXL are privately held companies and General Physics is a wholly owned subsidiary of NPD. The other firms are publicly traded.

GSE shares trade as GSES on the Nasdaq Stock Market and closed Friday at $4.25. GTS Duratek is DRTK on Nasdaq, closing Friday at $14.18 3/4. Interferon Sciences is IFSC on Nasdaq, $8.87 1/2 at Friday's close. Avenue trades as PIX on the American Stock Exchange, where it closed at $9.50 Friday.

National Patent's founder and chairman, Jerome Feldman, now spends more time in Howard County than he does at the conglomerate's headquarters in New York. Feldman, 68, divides his time between the offices of General Physics, NPDs biggest division, and those of GSE, where he took over as chairman in April, replacing William Kuhlmann.

In a recent interview, Feldman said his main short-term goal is to turn around GSE, a General Physics spinoff that specializes in simulation software and programs that handle manufacturing and distributions systems.

In the long term, Feldman wants to convert NPD from an investment firm into an operating company built around General Physics. In the process, the company plans to methodically dispose of most of the rest of NPD's diverse portfolio of companies, he said. "The only one I don't know if we're going to sell is GSE. That's so close to what General Physics is doing."

GSE reported a loss of slightly more than $1 million in the three months ended June 30 compared with a profit $426,000 in the same period a year earlier. The loss of some key contracts pared almost 20 percent from GSE's revenue for the first half of the year, prompting Feldman to implement a plan aimed at trimming overhead by $4 million a year.

GSE stock, trading for more than $10 a share at the beginning of this year, hit a 52-week low of $4 last month and has only recovered a little.

Fixing problems has become a way of life for Feldman. He spent most of the past decade digging NPD out from under a mountain of debt that the company accumulated in the early 1980s. When its soft contact lens patents ran out and with them a steady stream of revenue, the company invested in several businesses, among them General Physics. A lot of those companies couldn't be sold for a price high enough to pay off their debts, so NPD had to hold on to them.

To make matters worse, NPD borrowed heavily from Swiss banks. The loans were in Swiss francs. When the value of the dollar dropped compared with the Swiss currency, NPD had to pay back millions more than it had borrowed.

Feldman has whittled NPD's long-term debt from $277 million to about $6 million as of the company's last financial statement. He now wants to become debt free. "There's nothing like $300 million in debt to make you learn your lesson," he rues. "Never again."

To eliminate the debt, the company has sold off several investments, some at painfully low prices. One of those companies was GTS Duratek, an NPD subsidiary before it went public in 1986.

National Patent remained the principal owner of Duratek until early 1995 when it sold 1.6 million shares to Washington's Carlyle Group, which agreed to pump $16 million into the firm. NPD gave up its seats on the Duratek board, turning control of the business over to the prominent investment banking firm.

Carlyle paid only $3 a share for NPD's Duratek stock, which is now worth almost five times that much. The stock sank to about $5 in April after Duratek posted a $4.7 million first-quarter loss, but has recovered steadily since.

Since giving up control of Duratek, NPD has been methodically reducing its stake in the company. It sold 26,000 shares in June, 16,000 in July and another 27,000 in August, according to insider-trading reports filed with the Securities and Exchange Commission.

While those stock sales are expected to continue at a regular pace, the liquidation of NPD's other investments will depend on finding buyers willing to look at the companies at the right price. "Opportunistic" is the word Feldman uses.

How much money can the company raise by monetizing its holdings? That's the kind of question that causes investment bankers and securities analysts to crank up their spreadsheets and start crunching numbers.

Analyst David Kardell of New York's Oppenheimer & Co. has done the calculations. He figures NPD's assets are worth at least $20 a share. With the stock selling for $12, there's money to be made, said Kardell, who issued a "buy" recommendation in mid-August.

Though the stock of many companies sells for much more than the value of their assets, the market won't pay full price -- let alone a premium -- for an out-of-favor outfit like NPD. Kardell estimated the company's shares could move up to $15 within a year. The stock was trading at less than $10 when the Oppenheimer research report came out and already is almost halfway to Kardell's goal.

Feldman said if he can successfully cash in NPD's other investments the holding company may merge into General Physics. He shrugs off questions about what the company would be named but waxes enthusiastic about the future of GP, as lots of people call it.

Launched to train nuclear power plant operators, including engine-room crews on U.S. nuclear submarines, GP had to reinvent itself when the industry went into decline.

What has emerged is a "performance improvement" company that has accelerated its growth since longtime employee John McAuliffe worked his way up to the president's job. Revenue has grown from $108 million in 1995 to $117 million in 1996, and hit $69 million in the first half of this year, putting the company on track toward its 1997 revenue goal of $140 million. The company's profits are growing along with revenues, but are not broken out from NPD's.

As GP has grown, so has the share of its business generated by private-sector clients, which rose by 36 percent last year and accounted for more than half of revenue. Profit from private-sector business is substantially better than that from work for government agencies.

Training workers to do their jobs more efficiently and use new technology has become GP's specialty, McAuliffe explained. A lot of it is "mistake and error proofing," which involves not only teaching workers techniques that avoid flaws, but adopting processes to improve quality control.

Oppenheimer analyst Kardell projects that GP will be able to continue growing by 20 percent a year and that if it were a separate company, General Physics stock could be worth $11 to $14 a share.

With the parent company's shares already selling in that range, and the potential to turn the conglomerate's other assets into cash, NPD could have one more chance to become a hot tech company again. A LOOK AT . . . NATIONAL PATENT DEVELOPMENT The holding company owns stakes in three Maryland companies. National Patent Development Corp. General Physics Headquarters: Columbia Business: Provides "performance improvement" training for business and government. 1996 sales: $117 million 1996 profit: $6.5 million Ownership: Wholly owned by National Patent Development. GSE Systems Inc. Headquarters: Columbia Business: Makes enterprise-wide software. 1996 sales: $96 million 1996 profit: $4.1 million Ownership: 22 percent owned by

National Patent Development. GTS Duratek Headquarters: Columbia Business: nuclear waste disposal service 1996 sales: $44 million 1996 profit: $2.1 million Ownership: 15 percent owned by National Patent Development. Other NPD investments

- Five Star Group Inc.: Owns 100 percent of the New Jersey distributor of hardware and painting products.
- Avenue Entertainment: Owns 30 percent of the New York film producer.
- Interferon Sciences Inc.: Owns 15 percent stake in the New Jersey biotech firm.
- MXL Industries: Owns 100 percent of the plastic lens manufacturer.

Steven Katz joined the board of directors in May 1999. He is President of Steven Katz & Associates, Inc., a management consulting firm specializing in strategic planning and corporate development for technology and service-based companies in the health care, environmental, telecommunications and Internet markets. Mr. Katz`s prior experience includes five years with PriceWaterhouse & Co. in audit, tax and management advisory services; two years of corporate planning with Revlon, Inc.; five years with National Patent Development Corporation (NPDC) in strategic planning, merger and acquisition, technology in-licensing and out-licensing, and corporate turnaround experience as President of three NPDC subsidiaries; and two years as a Vice President and General Manager of a non-banking division of Citicorp, N.A. Mr. Katz is also a Director of Health Systems Solutions Inc. and NaturalNano, Inc., each publicly traded companies. From May 2007 until September 2008, Mr. Katz was President and Chairman of the Board of GammaCan International, Inc., a publicly traded corporation.

Lee Miller Neff, 1912 - 1999

Lee Miller Neff was born on month day 1912, at birth place, Oregon, to Jessie Vincent Neff and Saloma "Loma" H. Neff.

Lee had one brother: James Thomas Neff.

Lee married Louise Hattie Neff on month day 1937, at age 24 at marriage place, Washington.

Lee lived in 1920, at address, Oregon.

He lived in 1930, at address, Oregon.

Lee passed away on month day 1999, at age 86 at death place, Oregon.

Siblings (1) - William David Neff (born 1945)

NYTimes 2014 article - "From Warheads to Cheap Energy"

See [HN007O][hGDrive]

As the Cold War ended in the late 1980s and early '90s, a new fear arose amid the rejoicing and relief: that atomic security might fail in the disintegrating Soviet Union, allowing its huge stockpile of nuclear warheads to fall into unfriendly hands.

The jitters intensified in late 1991, as Moscow announced plans to store thousands of weapons from missiles and bombers in what experts viewed as decrepit bunkers, policed by impoverished guards of dubious reliability.

Many officials and scientists worried. Few knew what to do.

That is when Thomas L. Neff, a physicist at the Massachusetts Institute of Technology, hit on his improbable idea: Why not let Moscow sell the uranium from its retired weapons and dilute it into fuel for electric utilities in the United States, giving Russians desperately needed cash and Americans a cheap source of power?

Last month, Dr. Neff's idea came to a happy conclusion as the last shipment of uranium from Russia arrived in the United States. In all, over two decades, the program known as [the] **Megatons to Megawatts Program** turned 20,000 Russian warheads into electricity that has illuminated one in 10 American light bulbs.

Dr. Neff fathered the atomic recycling program in spite (or perhaps because) of his lack of name recognition, his inexperience on the world stage and his modest credentials in arms control. Moreover, he not only came up with the original plan but shepherded it for decades.

"I was naïve," Dr. Neff, 70, recalled in a recent interview. "I thought the idea would take care of itself."

In fact, it required sheer doggedness and considerable skill in applying nuclear science to a global deal freighted with technical complexities and political uncertainties. Yet in the end, Dr. Neff noted, the mission was accomplished: Uranium once meant to obliterate American cities ended up endowing them with energy.

Nuclear experts hail it as a remarkable if poorly known chapter of atomic history. The two decades of bomb recycling, they say, not only reduced the threat of atomic terrorism and helped stabilize the former Soviet Union but achieved a major feat of nuclear disarmament — a popular goal that is seldom achieved.

"It's an amazing thing," said Frank N. von Hippel, a physicist who advised the Clinton White House and now teaches at Princeton. The wave of arms destruction, he said, eliminated up to a third of the planet's atomic bomb fuel, making it "the biggest single step" in the history of nuclear arms reduction.

He called Dr. Neff an underappreciated hero, adding that in a time of governmental muddle and paralysis, his success was a striking example "of what one person can do."

Thomas Lee Neff was born in 1943 in Oregon, the older of two boys; his family raised chickens and grew most of its own food. He studied math and physics at Lewis & Clark College in Portland, graduating with highest honors, and received his Ph.D. in physics from Stanford. As a senior M.I.T. researcher, he specialized in energy studies, writing books on nuclear power, solar energy and, in 1984, the global uranium market. His timing was propitious.

In the nuclear age, the rare isotope uranium 235 has played starring roles in war and peace. When highly purified, to a level of 90 percent, it fuels atom bombs; at 5 percent, it powers nuclear reactors for electric utilities.

As the Cold War ended, Dr. Neff wondered whether these disparate worlds might be able to do business together. When Washington and Moscow announced major unilateral arms reductions in late 1991, he recalled, "I said: 'Wow. What's going to happen to all these weapons?' "

Dr. Neff, like many experts of the day, worried that the Soviet Union was ill equipped to deal with thousands of discarded bombs. The treaties and independent actions of the Cold War allowed nuclear arms taken from bombers and missiles to be kept in storage, raising the possibility of reuse, diversion and theft.

The beleaguered communist state, he feared, was already cutting back on nuclear upkeep, workers' pay and dozens of measures meant to keep weapons safe. He also suspected that newly impoverished Russian nuclear scientists, once a pampered elite, might seek work elsewhere.

“It all sounded dangerous,” he said.

His solution was atomic recycling. The question was how to float the idea.

On Oct. 19, 1991, nuclear experts filed into the Diplomat Room of the State Plaza Hotel in Washington. The agenda of the nongovernmental meeting was demilitarization. A Soviet delegation attended, as did Dr. Neff.

Outside the conference room during a break, he approached a leader of the Soviet bomb complex, Viktor N. Mikhailov, a canny apparatchik known for his love of Western cigarettes.

Dr. Neff asked whether he would consider selling the uranium in Soviet weapons.

“Interesting,” he said Dr. Mikhailov replied, puffing away. “How much?”

Five hundred metric tons, Dr. Neff said, giving what he considered a high estimate for the quantity of Soviet bomb fuel soon to become surplus. “If I had known how much they really had,” he recalled, “I would have said 700 tons.”

Even so, 500 metric tons was a lot: 1.1 million pounds, heavier than a fully loaded 747 jetliner.

Five days later, Dr. Neff made his idea public in an Op-Ed article in The New York Times, “A Grand Uranium Bargain.” The illustration showed a kitchen pot and spoon floating eerily above a countertop and — just behind — an open window. Outside was a bomber.

“If we do not obtain the material,” he warned, shadowy agents in the former Soviet Union, perhaps uncontrolled by central authority, might seek to “sell weapons-grade materials to the highest bidders.”

The idea gained support in both Washington and Moscow. Carrying it out, through a tangle of conflicting state and commercial interests, was another matter. Dr. Neff was there to prod it along at almost every turn. In late December 1991, he was among the last Westerners to see the Soviet hammer and sickle flying over the Kremlin.

The first shipment of uranium arrived in 1995; 250 more followed over the next 18 years. Last month, a freighter sailing from St. Petersburg to Baltimore delivered the last shipment. Strapped into transport pallets were giant steel drums, each holding about two bombs’ worth of diluted uranium.

Colorful signs on the drums showed fluttering Russian and United States flags, with a message in large type: “20,000 Nuclear Warheads Eliminated.”

Dr. Neff estimates that he flew 20 times to Russia and other former Soviet states to work on the original deal and its amendments. He says a book he is writing draws on thousands of documents.

Thomas B. Cochran — a senior scientist at the Natural Resources Defense Council in Washington who helped organize East-West interactions at the Cold War’s end, including the gathering where Dr. Neff met the Soviet official — said the American physicist deserved “99 percent of the credit” for the uranium deal. Its most important result, he added, was simply improving the relationship between the United States and Russia at a critical moment in history.

Last month, the Russian Embassy in Washington held a reception to mark the end of the Megatons to Megawatts program. Dr. Neff was an honored guest.

A brochure handed out at the reception reprinted his Op-Ed article, praising the commercial deal as a first for nuclear disarmament. It put the overall cost of the transaction at $17 billion.

Uranium from the dismantled weapons, it said, was diluted into 15,432 tons of low enriched uranium. The resulting reactor fuel supplied half of all American nuclear power plants.

The total electric power, it said, could illuminate the whole of the United States (roughly 20,000 cities and 115 million households) for about two years — or Washington, D.C., for 185 years.

The atomic sale, the brochure said, “is widely held to symbolize the end of the era of confrontation between the two major nuclear powers.”

In an interview, Ernest Moniz, the federal secretary of energy and a former colleague of Dr. Neff’s at M.I.T., praised him for not only proposing the plan but helping guide it for more than two decades.

“If he hadn’t stuck with it,” Dr. Moniz said, “it could have very easily been one of these great ideas that ends up just spinning its wheels.”

Millions of idealists, from President Obama on down, have sought a world without nuclear weapons. Dr. Neff, despite doing more than almost anyone to advance that goal, is circumspect about what he accomplished.

He made no mention of energy windfalls, geopolitical realignments or the biblical injunction to turn swords into plowshares.

The lesson of the story, he remarked in an interview, “is that private citizens can actually *do* something.”

A shipment of low-enriched uranium, equivalent to 10,000 warheads, arrived at an American plant in 2005.Credit...USEC

Harris-Kluge Recent Wedding

Sun., Sept. 8, 1968 7K
ST. LOUIS POST-DISPATCH

OF INTEREST TO St. Louisans is the wedding last Sunday in Nyack, N.Y., of Miss Svetlana Kluge and Robert Lewis Harris. The ceremony took place at the Russian Orthodox Church of the Holy Virgin Protection. The bride's parents are Mr. and Mrs. Michael C. Kluge, New York.

The bridegroom's parents are Mr. and Mrs. Lewis S. Harris, 1942 South Signal Hills drive, Kirkwood.

Maid of honor was Miss Catherine Giritsky. Other bridal attendants were Miss Natalie Giritsky, Miss Irina Troubetzkoy and Miss Natalia Troubetzkoy.

Thomas Neff was best man. Ushers were Victor Brunst, Steven Darland, Robert Druckenmiller, Alexander Giritsky, Frederick Hornbruch, Andre Kotchoubey and Serge Troubetzkoy.

After a wedding trip to the Caribbean, the couple will live in New York. Mrs. Harris is a doctoral candidate at Columbia University.

1974 - Participated in APS (American Physical Society) Reactor Safety Study - With Wolfgang (Pief) Panofsky and Harold (Hal) Lewis

See article in Journal for Peace and Nuclear Disarmament - [HP000G][GDrive]

Involves :

- Wolfgang Kurt Hermann Panofsky (born 1919)
- (https://en.wikipedia.org/wiki/Frank_N._von_Hippel)
  - father is - https://en.wikipedia.org/wiki/Arthur_R._von_Hippel
  - * Von Hippel received his Ph.D. in physics in 1924, and in 1930 married Franck's daughter, Dagmar.
  - ***James Franck - https://en.wikipedia.org/wiki/James_Franck***

Frank von Hippel *is a Senior Research Physicist and a Professor emeritus of Public and International Affairs in Princeton University's Program on Science and Global Security. He has a Ph.D. in nuclear physics from Oxford University (1962). He has worked on nuclear policy issues for almost half a century and has been praised by his fellow physicists "for his outstanding work and leadership in using physics to illuminate public policy in the areas of nuclear arms control and nonproliferation, nuclear energy, and energy efficiency" (American Physical Society 2010). The publisher of a collection of his essays, described him as "at the forefront of those scientists grappling with the troubled legacy of our Nuclear Age" and as offering "insights about the choices we must make and how science can help us to make them" (Springer Nature 1991).*

The edited and footnoted interviews published here are von Hippel's account of his years of engagement with a series of nuclear policy problems – mostly as an outsider but also as a White House official. He began by trying to strengthen nuclear-safety regulation in the United States. He and his colleagues then fought successfully to stop the US Atomic Energy Commission's planned "plutonium economy." As the chairman of the Federation of American Scientists, he worked with a group of physicists advising Mikhail Gorbachev in his successful efforts to end nuclear testing, reverse the nuclear arms race, and dismantle the tank confrontation across the Cold War boundary dividing Germany. After the Soviet Union collapsed, von Hippel worked in the White House to help launch cooperative programs to secure nuclear materials in Russia from theft and to eliminate the stocks of highly enriched uranium and plutonium resulting from the drastic down-sizing of the US and Soviet Cold War nuclear arsenals. In 2006, he co-founded the International Panel on Fissile Materials, which seeks to end the production and use of highly-enriched uranium and separated plutonium for both weapons and non-weapons purposes.

In a sense, von Hippel inherited the problem of nuclear weapons from his grandfather, James Franck, who participated in the US World War II nuclear-weapon project, overseeing the development of the process to separate plutonium from irradiated uranium. In the spring of 1945, Franck convened the group that produced the Franck Report, which became famous after the end of the war because it had warned of a nuclear arms race with the Soviet Union if the US used the new weapon in a surprise attack on Japan.

Von Hippel initially proceeded down the career path of a theoretical physicist until he was an assistant professor at Stanford. There, because of the Vietnam War and revelations that many consequential government decisions for technology had been based on political calculations rather than considerations of effectiveness or the public interest, he decided to change his career to focus on public policy. He and Joel Primack, a younger activist physicist, co-authored a book on the roles of scientific insiders and outsiders in influencing government policy. Von Hippel then opted for the outsider role for himself, starting in 1974 by organizing a study of reactor safety sponsored by the professional society of American physicists.

The impact of that study resulted in an offer to continue his research at Princeton. There, he learned from a colleague, Harold Feiveson, of the Atomic Energy Commission's (AEC's) proposal to base the world's future energy system on plutonium breeder reactors. India had just tested a bomb using plutonium that had been separated for supposedly peaceful purposes with AEC assistance. Feiveson, von Hippel and a third colleague, Robert Williams, organized a group that critiqued the AEC's proposed "plutonium economy." Their work helped provide the analytical basis for the Carter Administration's 1977 decision to try to shut down the program, which Congress finally agreed to five years later.

In 1979, von Hippel was elected chairman of the Federation of American Scientists (FAS), *a group created in 1945 by veterans of the US World War II nuclear-weapons program to try to prevent a nuclear arms race with the Soviet Union. Two years later, the Reagan Administration took office asserting that the Soviet Union believed it could fight and win a nuclear war. The Reagan Administration asserted that the only way for the US to deter nuclear war was to develop a similar posture. The public's reaction was the Nuclear Weapons Freeze movement. Von Hippel joined the movement, focusing his efforts on ending nuclear testing and the production of "fissile" materials for nuclear weapons.*

In 1983, in response to public concerns, President Reagan announced a program to develop a system to protect the US from a Soviet ballistic-missile attack – quickly labeled "Star Wars" by critics. A group of Soviet academicians wrote an open letter to US scientists asking whether they had changed their view that the proposed ballistic missile defenses (BMD) could easily be overcome by countermeasures and would provoke an offense-defense arms race. The FAS leadership responded that it had not changed its views and was invited to Moscow to brainstorm with a small group of the academicians on how to end the nuclear arms race. Two years later, Mikhail Gorbachev became the leader of the Soviet Union and the FAS group learned that the Soviet academicians they had been brainstorming with were advising Gorbachev.

During the ensuing five years, von Hippel found himself and his colleagues swept up in a head-spinning series of Gorbachev initiatives to end the nuclear arms race:

- *A unilateral nuclear test moratorium, verified by the US Natural Resources Defense Council (NRDC) because the Reagan Administration refused to reciprocate;*
- *A decision, after a public debate, that President Reagan's "Star Wars" initiative would collapse under its own weight (which it did), and therefore the Soviet Union could agree with the United States in the INF and START Treaties on the bilateral elimination of their land-based intermediate-range missiles and the withdrawal from deployment of half of their strategic warheads;*
- *The unilateral withdrawal of 5,000 Soviet tanks from eastern Europe, and an agreement to further Soviet reductions in the 1990 Treaty on Conventional Forces in Europe;*
- *"Glasnost" ("openness") visits to the Soviet Union's first plutonium-production city, its ballistic missile defense (BMD) test site, and demonstrations of the detectability of the radiation from a Soviet cruise-missile warhead on a Soviet missile cruiser in the Black Sea off Yalta; and*
- *Just before the Soviet Union's disintegration in 1991, denuclearization of the Soviet Army and withdrawal of nuclear weapons from all Soviet surface ships in parallel to similar actions by the United States.*

In 1993, von Hippel was invited in as an advisor on the Clinton Administration's plan to end US nuclear testing. Later that year, he was invited to join the White House Office of Science and Technology Policy where he became involved in launching programs to secure nuclear materials in Russia and to stabilize Russia's nuclear cities. He was also responsible for supervising the process of deciding how to dispose of excess US weapons-grade plutonium, and pushed to expand programs to end the use of weapon-grade uranium as a reactor fuel.

Back in Princeton, von Hippel co-founded Princeton's Program on Science and Global Security and the International Panel on Fissile Materials. His research since has focused primarily on ending the production and use of highly-enriched uranium and plutonium as reactor fuels worldwide and dealing with Iran's nuclear program along with the longer-term goal of total nuclear disarmament. He also has been working with citizens groups to educate the US Congress and the public on opportunities to advance nuclear nonproliferation and disarmament.

Now... the part that mentions Tom Neff : See article in Journal for Peace and Nuclear Disarmament - [HP000G][GDrive]

*[...] **The APS Reactor Safety Study***

*That year, 1974, **Wolfgang (Pief) Panofsky**, was president of the American Physical Society. He had been one of the younger physicists in the Manhattan Project and was in the observational aircraft that accompanied the bomber that destroyed Nagasaki. He was one of the original members of the President's Science Advisory Committee, which President Eisenhower created after the surprise of Sputnik in 1957 and he was a leading advisor on nuclear arms control for the following half century. My favorite recollection of Panofsky is toward the end of his life when we were standing at adjoining urinals at the National Academy of Sciences and he turned and said to me, "Frank, this is the only place where people know what they are doing!"*

*Panofsky chose **Harold (Hal) Lewis** as chairman for this APS study. For some reason, I took an immediate dislike to Lewis. I decided that his interest in the issue was to prepare himself to become a consultant to the nuclear industry. It is very difficult for me to conceal my feelings so the situation quickly escalated into one in which Panofsky felt he had to intervene. Somehow, with the help of Panofsky and **Tom Neff, who had taken a class with me at Stanford and was acting as Panofsky's assistant during Panofsky's year as APS President**, Lewis and I papered over our mutual dislike sufficiently to proceed.*

Again, the summer study was at Los Alamos but this time it was for a month.

*While we were there, I met **Harold Agnew**, the director of of the Los Alamos National Laboratory. He had worked on Fermi's reactor at the University of Chicago in 1942 and had been on the observation plane that had accompanied the bomber that destroyed Hiroshima .*

[...]

- *[**Wolfgang Kurt Hermann Panofsky (born 1919)**] - German-born American physicist who led the construction and operation of the two-mile-long electron accelerator at Stanford. Panofsky also was a leading government advisor and educator on nuclear arms control issues. The "Panofsky Ratio" I had measured as an MIT undergraduate was named after him because he had made the first measurement.*
- *[**Harold (Hal) Lewis**] - An Oppenheimer student who was a physics professor at the University of California, Santa Barbara.*

1979 (Feb) - Mention in MIT Research Paper - "ESSAYS ON URANIUM ENRICHMENT by RICHARD ALAN CHARPIE"

See PDF here : [HE0006][GDrive]

"Acknowledgements - I wish to thank my thesis supervisor, Professor Henry Jacoby, for his assistance and encouragement throughout the duration of this thesis. His ability to successfully wear two hats, as co-principal investigator on the Nuclear Fuel Assurance Project and as thesis supervisor, has contributed substantially to the progress of my research by coaxing me in a direction which simultaneously satisfied academic and policy analysis goals. In addition, I wish to thank Dr. Thomas Neff, the Project's other co-principal investigator, for his assistance with the analysis. Lastly, thanks are to due to the Department of Energy whose financial support of the Fuel Assurance Project made the research possible."

Uranium is also the subject of international security concerns because of its association with the proliferation of nuclear weapons

These security concerns are related to the nature and behavior of the international market for nuclear fuels. For example, political aspects of security become more salient if the uranium market is tight, or if there is little flexibility in supply arrangements. Conversely, an oversupply situation--or growing diversity of supply--lessens the impact of political and other constraints.

Uranium market study

THE INTERNATIONAL uranium market will offer abundant supplies through the end of the century, but market changes threaten the long-term health of the United States uranium industry, according to a new Massachusetts Institute of Technology study.

The study, carried out by M.I.T.'s International Energy Studies Group, is one of the first public efforts to clarify the present and future status of the international uranium market, the school said.

"Current conditions and trends are so favorable that there is little basis for worry about supply [of uranium] during the next 10 to 20 years," the study said.

But the authors, Dr. Thomas L. Neff and Prof. Henry D. Jacoby, said changing world market conditions "raise serious questions about the ability of the U.S. uranium industry to preserve its long-run vitality."

Noting that foreign ventures often are based on higher-grade, larger, and more easily exploited deposits, the report said the threat of low-cost foreign competition may suffice to restrain domestic investments in exploration and development and thus threaten the long-term health of the American uranium industry."

U.S. firms import uranium from Soviet, newspaper says

NEW YORK (AP) — American concerns imported $43.8 million of enriched uranium from the Soviet Union last year, the New York Times reported today.

The newspaper said it was the first time that a large amount of uranium had been traded directly between the two superpowers, whose trade has suffered since the Soviet intervention in Afghanistan at the end of 1979.

The imports of uranium, which made up 10 percent of U.S. imports from the Soviet Union last year, were recorded in the Commerce Department's report on Soviet-American trade in 1980, the newspaper said.

The Times quoted unidentified sources as saying the uranium was bought in Canada by a West German electric utility and was sent to the Soviet Union for enrichment. It was then sold to the Exxon Nuclear Co. of Bellevue, Wash., for nuclear fuel fabrication at a plant in Richland, Wash. The fuel then was to be re-exported to West Germany.

The United States monopolized the market for enriched uranium outside the Soviet bloc until 1974, when the Soviet Union began to offer the enriched uranium to Western countries. Some Western European nations are now also in the business. American nuclear power plants usually use uranium mined and enriched in the United States.

In another deal last year, Soviet enriched uranium was imported from West Germany for a reactor in upstate New York owned by the Rochester Gas and Electric Corp.

Neil Moore, the senior licensing officer of the Office of International Programs at the Nuclear Regulatory Commission, said the two incidents seemed to be the first U.S. imports ever of enriched uranium from the Soviet Union.

Thomas L. Neff, the head of the International Energy Studies Program at the Massachusetts Institute of Technology, said, "The arrival of Soviet enriched uranium in the United States indicates increasing flexibility in international transactions to meet the growing demand."

Tulare Advance-Register (Tulare, California) • 31 Jan 1981, Sat • Page 1

Impact of oil prices studied

SACRAMENTO (UPI) — The state Energy Commission Friday set up a special committee to study the impact on the poor and elderly of President Reagan's decision to decontrol oil prices.

At the same time, Reagan's action was praised by energy experts from Harvard and Massachusetts Institute of Technology in Sacramento to advise the state government on coping with future oil shortages.

Gov. Edmund G. Brown Jr. had no immediate comment.

The commission will set up an advisory committee to "examine the economic and social impacts of Reagan's decontrol order," Chairman Russell Schweikart said.

He predicted that Reagan's decision to end oil price controls eight months before they would have expired eventually will mean higher gas prices for motorists and renewed pressure on smallscale oil refiners.

"The utilities also will undoubtedly pass on increased prices paid for their oil to California electric consumers," Schweikart commented. About 56 percent of the state's electricity is generated by burning oil and natural gas.

Reagan's move may force a more rational allocation of American oil supplies said David A. Deese, editor of the widely read book "Energy and Security."

Deese and Thomas L. Neff, an energy specialist from Massachusetts Institute of Technology, were in Sacramento to advise the enegy commission on oil shortages they said are sure to be felt in California in the 1980s. Deese is director of security studies at Harvard's Center for Science and International Affairs. They held a news conference Friday.

Neff said it was a "major mistake" for government to try to protect the American consumer from the oil price runups by Middle East countries in the 1970s, the Iranian hostage crisis and the Iran-Iraq war.

"By isolating our internal oil markets from the world, we only encouraged the growth of oil demand," he commented. "That played into the hands of the OPEC countries. Also, by not planning for emergencies or stockpiling oil we made it easy for OPEC to raise prices."

Deese, director of security studies for Harvard's Center for Science and International Affairs, urged Californians to see their oil problem in a global context.

Reagan's move may force a more rational allocation of American oil

Soviets Transferred Uranium Worth $43 Million to U.S.

By THEODORE SHABAD
The New York Times News Service

NEW YORK — Soviet-American trade, which has been limping along since Moscow's military intervention in Afghanistan, was given impetus from an unusual source last year — the transfer of enriched uranium from the Soviet Union.

The Department of Commerce has disclosed in a trade review, without elaboration, that $43.8 million worth of uranium entered the United States from the Soviet Union in 1980. It was the first time that a sizable amount of the strategic commodity had figured in direct trade between the two countries. Some industry sources suggested that it could be the beginning of a trend.

THE URANIUM industry is secretive, and producers and consumers do not ordinarily disclose amounts or prices of imports and exports or information on origin and destination. But interviews with government officials, industry spokesmen and academic specialists revealed that a West German electric utility had sent uranium to be enriched in the Soviet Union and then to be fabricated in the United States into nuclear fuel for reexport to West Germany.

In an unrelated transaction last year, Soviet enriched uranium originally intended for an Austrian utility was imported from West Germany, for use as fuel in the Ginna nuclear station of the Rochester Gas and Electric Corporation in upstate New York. American nuclear plants normally use uranium mined and enriched in the United States.

The transfers added a new twist to the already complex patterns of uranium trade. With most production, consumption and processing plants concentrated in a few nations, it is not unusual for shipments to crisscross the world, covering long distances on their way from mine to nuclear power plant.

THOMAS L. Neff, an authority on the uranium market who heads the International Energy Studies Program at the Massachusetts Institute of Technology, noted that the Soviet Union had been enriching uranium for utilities in Western Europe, especially West Germany, since 1974. The site of the Soviet plant, because of secrecy surrounding nuclear weapons, has not been disclosed.

"The arrival of Soviet enriched uranium in the United States indicates increasing flexibility in international transactions to meet the growing demand," Neff said. "With continuing large-scale procurement of fuel for power plants, we are likely to see more such complex deals."

At the Nuclear Regulatory Commission in Washington, Neil Moore, senior licensing officer in the Office of International Programs, said the two import licenses issued appeared to be the first for Soviet enriched uranium. He said he was aware of no legal barriers to such importation.

To Moscow Talk, Bush Says Nuts

PHILADELPHIA (UPI) — Vice President George Bush said "nuts" to the Soviet Union yesterday for criticizing the U.S. decision to produce the neutron bomb.

In a speech at the 82nd national convention of the Veterans of Foreign Wars, Bush also said the Reagan administration's decision to add $32 billion to the defense budget for fiscal 1981 and 1982 was necessary to preserve peace.

"I'VE BEEN mulling over the things that the Soviets said about us last week" regarding "the de-

NUCLEAR ENERGY

Sale of novel nuclear fuel triggers alarm

Plutonium-bearing MOX, in wrong hands, could be used for bombs, critics say

By Corie Brown
Special to the Globe

A number of government and academic nuclear fuel experts in the United States are having nightmares over recent decisions by France, Germany and Belgium to begin worldwide marketing of a new type of nuclear reactor fuel containing plutonium.

The critics say widespread marketing of the fuel, known as mixed oxide or MOX fuel, will greatly increase world stockpiles of plutonium in a form that can easily be converted to a mixture rich enough to build a nuclear bomb or at least set off a deadly "nuclear fizzle." Ultimately, they say, that escalates the risk that a terrorist group or a government intent on evading treaties limiting profiferation of nuclear weapons could get their hands on a supply of the fuel and use it to build a bomb.

The Reagan administration quietly has been seeking assurances from nations planning to market or use MOX fuel that they will impose tight controls, said a State Department official, who spoke on condition of anonymity.

Those efforts, however, do not allay the concerns of many nuclear experts. The United States does not make or use this type of fuel, which, in the view of several specialists, has no cost or efficiency advantages over conventional nuclear fuels.

What is particularly worrisome to the critics is that the reported customers for MOX fuel include countries, such as Brazil, that do not have nuclear weapons and have no visible need for specialty nuclear fuels.

"The international commerce of MOX fuel is the central nuclear weapons proliferation question in the world," said Dr. Harold Feiveson, a plutonium expert at Princeton University's Center for Energy and Environmental Studies. The traffic in MOX fuel, he added in an interview, threatens to make an "ordinary commodity" of plutonium.

In an article in the journal Science last month, Feiveson warned that widespread reprocessing of spent nuclear fuel to produce MOX and other plutonium products "would create a challenge of nightmarish proportions for those seeking to prevent diversion of plutonium to weapons."

The prospects are, however, that the trade in MOX fuel will grow. Great Britain and Japan say they plan to introduce their own lines of mixed-oxide fuel early in the 1990's.

MOX fuel has the look and feel of the standard fuel used in reactors around the world and would be used in conventional light-water reactors similar to the Pilgrim plant in Plymouth or Seabrook in New Hampshire. Both fuels have cylindrical

■ **MOX**

Continued from Page 43

fuel pellets stacked end to end in slender rods several yards long, which are bound together into bundles to form a reactor core.

The difference is that the MOX is a blend of 95 percent natural uranium (U-238), 1 percent enriched uranium (U-235) and 4 percent plutonium oxide. Conventional fuel has no plutonium.

Reports have been circulating for months that Brazil has approached France to buy MOX. The Brazilian official authorized to speak on the subject could not be reached last week. Taiwan, South Korea, India, Pakistan, Israel and Argentina also reportedly are in the market for MOX fuel.

Although France, Belgium and West Germany say they have not sold MOX to these countries, Princeton's Feiveson said it is disturbing that non-nuclear weapons nations are seeking MOX, precisely because it could secretly be used to develop weapons.

Even if governments resist the opportunity to join the nuclear weapons club, individuals might not, added Dr. Thomas Neff of the Massachusetts Institute of Technology's Center for International Studies. A handful of terrorists working in a basement laboratory with rudimentary skills and crude instruments could create a nuclear bomb with a single pirated 220-pound shipment of MOX fuel.

The 'dirty fizzle' threat

It is theoretically possible, Neff said, for relatively unsophisticated laboratory technicians to extract the plutonium from the MOX fuel powder with nitric acid. In that rough state, the plutonium could be enough to set off a nuclear chain reaction and create a "dirty fizzle" of radioactivity. This would not technically be a nuclear explosion, but the effect could be just as deadly and could easily make uninhabitable the center of a city the size of Boston. With a little finesse, Neff added, an actual nuclear bomb could be built.

A key official in the US arms control bureaucracy, who requested anonymity, said uncontrolled shipments of MOX fuel around the world make such a scenario "inevitable." Although it is frequently assumed that it would be impossible for a terrorist group to produce a bomb, this official, like Neff, contended that MOX, it would take just five technicians to build a simple plutonium nuclear bomb from a supply of MOX.

Theodore Taylor, a former Department of Defense nuclear weapons specialist and now an independent physicist working for international nuclear disarmament, agreed. "It is certainly possible [under those circumstances] to build a bomb equal to 1,000 tons of high explosives," he said. "The international commerce in mixed oxide nuclear fuel, unless much more effectively protected from theft or diversion to weapons use, could allow this to happen."

In light of such risks, why are France, Germany and Belgium anxious to sell MOX fuel?

There is no performance advantage to MOX, said Bertram Wolfe, General Electric Co. vice president and general manager for nuclear fuel. It does not last longer than conventional fuel nor generate more heat. And it is costlier to use, Wolfe said.

Part of the answer, he added, probably lies in the hundreds of millions of dollars that France, West Germany, Japan and others have invested in nuclear fuel reprocessing, in large part to guarantee their energy independence in the future. Much of that investment, he noted, began at a time when partially refined uranium (yellowcake) was selling for $40 a pound and it made economic sense to reprocess spent nuclear fuel for reuse. Today, with uranium selling for $17 per pound, it costs far more to recover the usable uranium and plutonium than to buy fresh uranium and bury the spent fuel.

But for countries that made the investment in reprocessing, making and selling MOX fuel is one way to recover some of those costs. Aside from that rationale, Wolfe said, "There is a realization around the world that this [reprocessing and MOX fuel] activity does not make sense."

Recouping investments

The business of reprocessing spent nuclear fuel is part of what is known as "completing the nuclear fuel cycle."

That cycle begins with mining uranium; next it is fabricated into fuel and used in a reactor. In the United States, Canada and Sweden, most spent fuel is simply disposed of in storage systems when too much of the uranium has broken down into other elements to sustain a fission reaction.

Reprocessing makes it possible – though at great expense – to extract unused uranium from the highly radioactive spent fuel rods, along with the plutonium created during nuclear fission. What remains is intensely radioactive waste. In the United States, a different process produces plutonium for nuclear weapons.

But in France, Germany and Belgium, the extracted uranium and plutonium are being fed back into the front end of the cycle to be fabricated into conventional, MOX or breeder reactor fuel. "Breeder" reactors use plutonium as fuel and produce even more plutonium as a by-product.

France and other countries have made major investments in developing breeder reactors, but much more plutonium is gathered from reprocessing than is needed for them. Some of that plutonium is now being used in MOX fuel. The rest is being stockpiled. French officials have estimated there will be a cumulative worldwide plutonium stockpile of 70 tons by 1995 and 170 tons by 2000.

The growing plutonium stockpile

Growth in non-communist countries of plutonium in reactor fuels, compared with plutonium in nuclear weapons of the US, USSR, France and UK, through start of 1984. Projections not available for weapons plutonium.

France defends decision

The French government defends as "prudent" its decision to market MOX. In a written response to queries on the issue, the French Embassy in Washington said "because France has no coal, oil or natural gas resources, an ambitious nuclear power program was launched. . . and a strong fuel cycle industry was developed" to ensure maximum use of uranium resources.

Because of the expense of stockpiling the plutonium it doesn't now need, the French government estimates, it could save the equivalent of $600 million between now and the year 2000 if some of that stockpile were woven into MOX fuel.

Dr. Rolf Randl, head of the nuclear fuel division at the Ministry of Research and Technology in Bonn, said Germany, like France, decided more than a decade ago to "close the fuel cycle" as the greatest assurance of a domestic energy supply. That means reprocessing spent fuel, building breeder reactors and using excess plutonium in fuel for commercial reactors.

"We are in the very beginning phases of (MOX fuel use) right now. . .," he added. "We are adding fabrication capacity. . . Actively marketing our MOX fuel abroad has not really happened yet. . . It will depend on what kind of world market develops."

A State Department spokesman who would not speak for attribution said the United States considers it inconsequential if France, Belgium, West Germany, Japan or Great Britain produce MOX for their own use. The United States assumes they are observing the 1979 Nuclear Non-Proliferation Treaty and trusts that the United Nation's International Atomic Energy Agency is acting as the watchdog assuring compliance with that treaty, he said.

But US officials and others are worried now that these countries and others want to sell plutonium fuels outside their borders, and the United States is pressing for new controls.

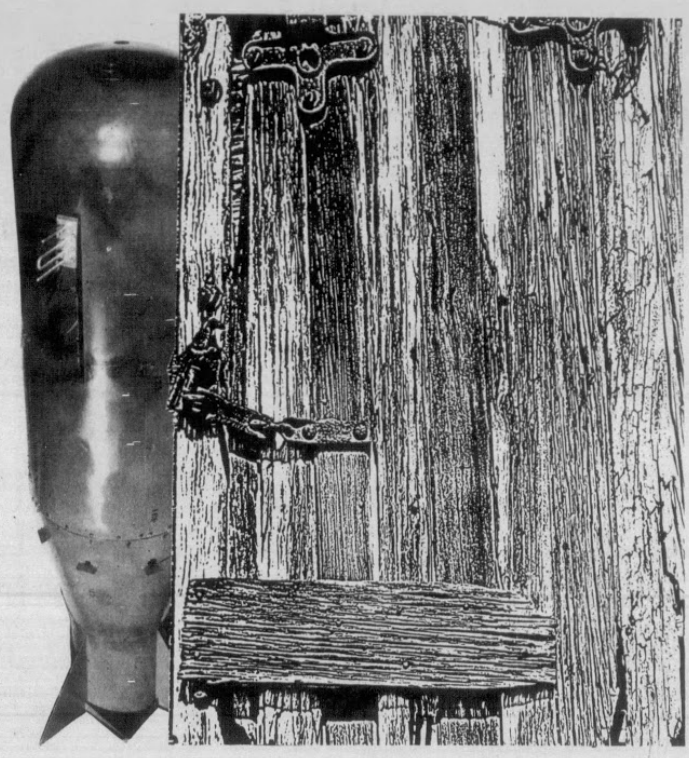
Doors of secrecy unlock to reveal nuclear cities

Like in U.S., ex-Soviet Union's nuclear complexes struggle to find role in changed world



By WILLIAM J. BROAD
N.Y. Times News Service

■ **EDITORIAL:** Soviet scientists a valuable resource. **Page D-6.**

Ten previotsly unknown cities of the former Soviet Union have suddenly emerged from the mists of the Cold War, prompting anxious speculation about their fate.

The cities, with code names like Tomsk-7 and Arzamas-16, formed the heart of the Soviet military's vast industrial complex for the design and production of nuclear arms.

Their disintegration is now seen as threatening to send scientists and materials flying into foreign hands in a new kind of international peril.

But scores of interviews with experts in the United States and Moscow, including Russian arms scientists themselves, show that the nuclear cities and their hidden reservoirs of scientific talent are also struggling to save themselves.

Lifting some secrecy, they now want to go commercial, embark on joint projects with the West and do nearly anything in their power to survive and avoid falling apart.

These cities are mirrored in America by a coast-to-coast complex built over the decades. Its major sites, Los Alamos, Livermore, Hanford, Pantex, Savannah River, are well known and far less secretive.

The American complex employs nearly 100,000 people in 13 states and costs about $11 billion a year just to operate.

It turns out that the former Soviet complex is far larger. Its fate poses far larger problems — and perhaps opportunities.

The Bush administration recently warned that economic chaos, military decline and high unemployment could shatter the complex and scatter its experts to the wind. Yet some Western analysts, and Russian ones as well, express guarded optimism.

"There is hope," Dr. Nikolai N. Ponomarev-Stepnoi, a high official of the Kurchatov Institute of Atomic Energy in Moscow, said in an interview. But he added that if cuts in government financing were not offset by new revenue or joint ventures with the West, "there is danger."

Not all experts agree. Russian government officials often dismiss the specter of atom mercenaries as a scare tactic used by arms scientists intent on stabilizing their salaries in a time of economic discord.

Cultural barriers, these officials say, would bar the easy transfer of scientists and their families to foreign lands.

Yet ferment is real. Russian nuclear experts have received job offers from Iraq and Libya and a few are said to be taking up Western posts, in Albuquerque, for instance.

Meanwhile, Russian bomb makers in the secret cities are striving to invent new ways of making money at home. Some of the initiatives would hinder atomic leakage, others encourage it.

A Russian leader trying to save the cities is Viktor N. Mikhailov, a chain-smoking apparatchik who directs the bomb complex from his Moscow post at the Ministry of Atomic Power and Industry.

He exudes confidence, even when asking for a handout.

Smiling broadly, he argued last month in Moscow that $400 million recently appropriated by the American Congress for warhead dismantlement in Russia should be given exclusively to his agency, saying his workers "are almost unemployed these days."

Some American experts fear any American aid might covertly be used to bolster Moscow's arsenal.

In a different area, Mikhailov has stirred Western anxiety by encouraging his legions in the secret cities to sell atomic services abroad, including peaceful nuclear explosions for the bulk incineration of chemical weapons and toxic wastes.

Western experts fear such nuclear sales will expand to include bomb parts and weapon materials, but Mikhailov derides that idea.

A favorable outcome from all this is possible, some experts say. But many speak only of lessening the dissemination threat, not eliminating it.

Dr. William G. Sutcliffe, a senior physicist at the Lawrence Livermore National Laboratory in California, a federal center for the design of nuclear arms, recently went to Russia to speak with his counterparts there. He said the danger was acute.

The Soviet Union got a late start in the nuclear arms race but then forged ahead in perfecting weapons for the Cold War. Its first atomic bomb was detonated in 1949, four years after America's initial mushroom cloud. Its first hydrogen bomb was exploded in 1955, three years after the United States did so. In 1961, the complex came into its own by detonating the largest nuclear blast of all time, one equal to a staggering 58 million tons of high explosive or nearly 4,000 times more powerful than the bomb that leveled Hiroshima.

By the late 1980s, the Soviet Union's secretive maze of nuclear design labs, reactors and factories had grown enormously in size, dwarfing the American complex.

"It was several times larger, if only because it had 14 reactors operating" simultaneously to make plutonium and tritium for bomb fuel, said Dr. Robert S. Norris, senior researcher at the Natural Resources Defense Council in Washington and co-author of the *Nuclear Weapons Databook*, a multivolume reference series.

A recent federal intelligence report estimates that the complex now employs some 900,000 people ranging from blue-collar workers running lathes to members of the military guarding nuclear arms.

Federal officials said as many as 2,000 people know how to make nuclear arms.

The newspaper Yomiuri Shimbun of Tokyo, citing a secret Russian document, reported late last year that 755,800 experts and their families live in the 10 top-secret Soviet cities devoted to nuclear arms work. American experts are familiar with only some of the cities.

The Soviet complex was a closed society for decades. But it is now opening to the outside world in a desperate bid for survival, giving a rare glimpse of its inner workings.

Some 200 or so miles east of Moscow, not far from Nizhny Novgorod, or what used to be called Gorky, lies the main nuclear weapons laboratory of the former Soviet Union, Arzamas-16.

It is now regaining its former historical name, Sarov. This ancient city was once known for the famous Sarov monastery and one of Russia's most hallowed saints, St. Seraphim.

But in the 1940s it was ringed with barbed wire and disappeared from maps as it was turned into the first Soviet center dedicated to the design of nuclear arms. It created the first bomb.

Today the site has 80,300 residents, including scientists, their families and townspeople, Yomiuri Shimbun said. In addition to designing arms, the laboratory has developed powerful lasers for trying to harness nuclear fusion for energy production.

The laboratory's day-to-day activities are run by Dr. Yuri A. Trutnev, a elder physicist who speaks of shifting the lab's nuclear work toward peaceful ends.

"The genie is out of the bottle," he said in an interview last month. "Let's use it for the benefit of mankind."

But Trutnev was quick to add that the weapons legacy would not suddenly disappear. "Realistic politicians say nuclear weapons must be preserved," he said. "That doesn't mean we shouldn't reduce them. But the knowledge and the know-how must be preserved."

At a Kiev meeting on warhead dismantlement in December, Trutnev outlined a plan to use underground nuclear explosions to destroy the cores of discarded nuclear arms.

A single blast could demolish up to 20,000 cores, he said. Such work would give the laboratory a new challenge, at least for a while.

In a similar vein, Arzamas-16 is allied with Mikhailov in marketing nuclear blasts for the incineration of highly toxic wastes. It has close ties to a new Soviet company, International Chetek Corp. of Moscow, which is promoting the work, and has a team of scientists preparing a bomb for a test.

Yet some analysts said political foes of underground blasts might succeed in blocking the project.

Just east of the Ural Mountains, some 25 miles north of Kyshtym, lies Chelyabinsk-70, founded in 1955 as the second design laboratory. Today it has 46,300 residents, according to Yomiuri Shimbun.

Ahead of the times, the scientific director of Chelyabinsk-70, Dr. Evgenie N. Avrorin, went to the Livermore weapons laboratory in California to discuss joint research in 1990.

On his agenda was what to do with nuclear materials from old warheads, how to conduct ecologically clean blasts in closed chambers and how to make fuels for laser fusion. To date his efforts have yielded no joint projects.

More successfully, Chelyabinsk-70 has gone commercial. Soviet television reported last year that it was producing and selling personal computers. And it has perfected the explosive synthesis of very small industrial diamonds, which are now for sale.

"Entrepreneurs and business are the best way to go," Dr. Vadim A. Simonenko, the senior arms designer at Chelyabinsk-70, said in an interview.

Stalin's early interest in the bomb got serious in 1943 when he directed that its feasibility be studied in Moscow. Dr. Igor V. Kurchatov led the work, which included building the Soviet Union's first nuclear reactor.

Since then, the Kurchatov Institute, as it is known, has focused on making innovative reactors, including ones for use in space. Though not a secret city, it is facing serious problems as budgets fall and temptations rise to send its nuclear expertise abroad.

Ponomarev-Stepnoi, the institute's first deputy director, said Kurchatov experts had been recently courted by Libya, adding that the job offers were rejected.

"Our scientists should work in the civilized world, in civilized countries," he said. "There is danger that our people will try to find employment in Third-World countries if their desire to work in the civilized world is not appreciated."

To help finance its scientists amid growing turmoil, the institute last year agreed to sell one of its formerly secret technologies, a Topaz-2 space reactor, to the Pentagon.

But the $15 million deal has been stymied by American red tape.

Dr. Mohamed S. El-Genk, a nuclear engineer at the University of New Mexico, has bought Kurchatov equipment, saying the power of the dollar over the ruble is so great that even relatively small sales can keep Russian teams supported financially for years.

"The best thing we can do is buy their technologies and try to insure that they still do science there," he said, adding that the situation could otherwise become "really dangerous."

In a sign of the times, El-Genk noted that he now runs a collaborative research project with Kurchatov and that some of its Moscow experts were soon to take up posts at the University of New Mexico.

Russia and other former Soviet republics have many other secretive nuclear sites, including Krasnoyarsk-26, Penza-19 and Zlatoust-36.

New projects at them could easily include the accelerated cleanup of pollution. At Chelyabinsk-65, six nuclear reactors have so poisoned the Techa River with radioactivity that, according to a working paper of the Nuclear Weapons Databook, "it is cordoned off with a wire fence and people are forbidden to catch fish, pick mushrooms or berries, or cut the hay."

Western experts say the fate of the Russian complex partly depends on the American government, which is still pondering its options and wary of aiding its former foes.

Some analysts fault the Bush administration for moving slowly to accept Russian offers for nuclear sales or joint projects, saying a modest investment could help lessen the risk of a Russian brain drain.

The Natural Resources Defense Council, a private group whose Washington office has strong ties to Russian weapon scientists, is mounting a crash effort to fund their research and shift it toward environmental issues, including how to clean up Russia's mountain of nuclear waste.

"The U.S. should hire all of them and put them to work on some hard technical problem," said Dr. Thomas L. Neff, a physicist at the Massachusetts Institute of Technology who attended the Kiev conference last month. "It would be cheaper than buying a battleship."

Indeed, Sutcliffe of the Livermore laboratory has calculated that as little as $10 million a year could finance the work of 10,000 important nuclear experts in the former Soviet Union.

But many experts say the federal government is likely to balk at direct bailouts, given the reticence it has already shown in buying Russian technology.

"There is hope," said Ponomarev-Stepnoi of the Kurchatov Institute. "But the American bureaucracy works very slowly. Up to now, there is no agreement between our countries for the peaceful utilization of atomic energy. And this makes any other contacts and programs very difficult."

Uranium deal entices the U.S.

1992-08-03-the-daily-spectrum-saint-george-utah-pg-8-clip-uranium

by Copley Editorial Service

The Russian government has made an offer that the rest of the world can scarcely refuse. Desperate for hard currency, the Russians have approached the United States, France and Japan with a proposal to sell the uranium from the former Soviet nuclear arsenal for use in domestic power plants.

Dismantling all of those nuclear missiles under existing international accords will release thousands of pounds of highly enriched uranium — enough, according to Dr. Thomas Neff of the Massachusetts Institute of Technology, to supply all the needs of 20 commercial reactors.

If they can't sell it, the Russians will have to keep this deadly material in storage. That would pose all the familiar environmental threats with one more added one: Experts predict that the enriched uranium would inevitably start turning up on the international arms market because, unlike the uranium in power plants, this stuff is ready-made for use in a wide range of weapons.

U.S. manufacturers are eager to participate in the proposed sale, since diluting weapons-grade uranium to the levels of radioactivity suitable for reactors promises to be a very profitable business for them. That could provide a welcome shot in the arm for some sectors of the domestic economy, and it might give a boost as well to the moribund market for new nuclear power plants.

But there are problems. Figuring out how to transport the material safely from the former Soviet Union is the most important one. As a result, it may make more sense to process the material right there, which could provide some much-needed jobs and technical training for Russia's work force.

In addition, even if a plan can be worked out for the uranium, that won't resolve the problem of disposing of the plutonium that's also being extracted from those warheads. Plutonium can't be converted to other uses as easily as enriched uranium. Japan has proposed developing a new kind of reactor for the Russians that would burn plutonium, but it's not clear who would — or could — afford to pay for it.

The U.S. Department of Energy is reviewing the uranium deal. That agency has a special interest in the issue since it's the world's largest producer of reactor fuel and would likely see a sharp decline in its business if the Russian offer is accepted.

But that shouldn't stop the Bush administration from putting the interests of world security first and doing all that it can to make this proposal work.

1993 - Mention in IAEA Bulletin

[HI0001][GDrive]

1997 (April) - Szilard Award Goes to Tom Neff

See American Physical Society - Newsletter - Physics and Society Apr '97 - News - [HX0005][GDrive]

- *At the April meeting in Washington, DC, APS will give the Leo Szilard Award for Physics in the Public Interest to Thomas Neff, a senior member of MIT's Center for International Studies. Neff is being cited "for proposing and working to keep on track the historic agreement for the US to purchase uranium from the former Soviet Union weapons stockpile and to transform it from highly enriched uranium to low-enriched uranium for civilian purposes, thereby significantly reducing the numbers of nuclear weapons." According to Frank von Hippel (Princeton University), this agreement has also helped to stabilize Ukraine's decision to become a non-nuclear-weapon state by giving that new nation an economic interest in disarmament.*
- *After receiving his* ***PhD in theoretical physics from Stanford University in 1973, Neff held postdoctoral positions at Berkeley, Stanford and MIT. At Stanford, he worked as an assistant to Wolfgang Kurt Hermann Panofsky (born 1919), who was APS president at the time, on matters of science and public policy, helping with the first studies of these topics and assisting in the formation of the Panel on Public Affairs****. From 1977-85, Neff was manager and director of MIT's International Energy Studies program. He has been an advisor to numerous US government agencies as well as to governments and companies around the world.*
- *Over the years, Tom has worked on issues of energy policy and nuclear nonproliferation. He was a senior staff member of the Ford Foundation's study, "Nuclear Power Issues and Choices." He has written books and articles on oil and nuclear fuel markets and on solar energy.*
- *In a New York Times Op-ed on 24 October 1991, Neff proposed the purchase of Soviet weapons-grade uranium by the US government. The Government picked up his idea and agreed in January 1994 to purchase 500,000 kilograms of Soviet weapon-grade uranium after it has been blended down to low-enriched uranium for use in power-reactor fuel. Since then Neff has worked creatively and successfully to help devise strategies to overcome the obstacles to the agreement as they have arisen. The obstacles have ranged from trivial to profound commercial and policy problems on both the Russian and US sides of the deal. In Neff's words, "I've had to become part of the interagency process in Russia as well as the US, broker a deal between the US Administration and Congress (the Domenici legislation) and keep the commercial players true to the terms of the deal. The larger issue is that policy processes and institutions still reflect the cold war, rather than being redesigned to undo it. I hope to talk about this in Washington."*

1998 (Aug)

Privatizing U.S. National Security: The U.S.-Russian HEU Deal At Risk

Just before their end of summit press conference on September 2, Russian President Boris Yeltsin informed President Bill Clinton that he was going to announce the end of the historic "HEU deal" signed by the two countries in 1993. Under this unprecedented government-to-government agreement, the United States agreed to purchase, over a 20 year period, 500 metric tons of highly enriched uranium (HEU) from dismantled Soviet weapons that Russia would "blend down" to low-enriched uranium (LEU) for sale to the United States as fuel for civilian nuclear reactors. The deal—worth an estimated $12 billion to Moscow—would guarantee that the Russian HEU, enough to build more than 20,000 nuclear weapons, would never again be used for weapons purposes.

The HEU deal, initiated by President George Bush and signed by President Clinton in February 1993, arose from a proposal to U.S. and Russian officials in October 1991 (only weeks before the dissolution of the Soviet Union)< 1 > and subsequently became the centerpiece of U.S. efforts to address what is arguably the most extreme proliferation threat since the beginning of the nuclear age: the possibility that nuclear weapons, the fissile material from them, or the technical skills necessary to make them would be diverted from the rapidly decaying Soviet military industrial complex to rogue states, terrorist groups or countries with nuclear ambitions. To date, Russia has shipped LEU made from about 50 tons of HEU (10 percent of the total)—the equivalent of about 2,000 nuclear weapons.

Because Russia's closed "nuclear cities" that are responsible for making nuclear weapons are unavoidably involved in the destruction of these weapons and the purification and blending down of HEU, the U.S.-Russian deal ensures that money flows to precisely those places and people that present the largest proliferation threat to the world. The need to verify that the LEU that Russia sells under the deal truly comes from HEU has given the United States the opportunity not just to monitor the destruction of Russian weapons-usable fissile material, the so called transparency process, but also to assist Moscow in improving fissile material protection, control and accounting systems that further protect inventories of these materials. In addition, U.S. national laboratories have developed active relationships with an increasing number of Russian "nuclear cities," an engagement that builds peaceful relationships with the most capable of Cold War adversaries and the most dangerous potential contributors to global nuclear weapons proliferation. These otherwise intrusive measures—and new initiatives on plutonium and closed cities—are possible largely because of the more than one half billion dollars per year Russia gains from the HEU deal.

In short, the HEU deal benefits Russia, the United States and international security. Why then did Yeltsin threaten to end the deal? The answer lies in recurrent failures on the part of both governments to implement the deal. While this failure is due in part to Russian bumbling and commercial incompetence, it is the United States that has created the real impediments to success. Despite warnings and opportunities to intervene, Washington has consistently put domestic commercial and financial interests, most notably those involved in the recent privatization of the U.S. Enrichment Corporation (USEC), ahead of U.S. national security interests. If the deal is to be repaired, the United States must reassume the responsibility it has abdicated. If decisive action is not taken, shipments will end, perhaps permanently.

An Unusual Deal

The basic terms of the HEU deal are outlined in an agreement signed by the United States and Russia on February 18, 1993. However, the HEU deal is unusual in that it calls for the parties to carry out their obligations through commercial mechanisms. Under the agreement, each government was to appoint an "executive agent" that would carry out commercial implementation of the deal through contracts for the purchase and sale of the Russian LEU.

Russia assigned implementation to its Ministry of Atomic Energy (MINATOM), which would utilize its experienced government trade organization AO Techsnabexport (TENEX). In a fateful move, the United States, which initially made the Department of Energy (DOE) its executive agent, committed to make USEC—a newly created, government-owned corporation—its ultimate executive agent. Created by the Energy Policy Act of 1992 and slated for eventual sale to private investors, USEC was the result of a 20 year effort to make the government's uranium enrichment operations more "business-like."

Unfortunately, actions taken by U.S. government officials—some of whom later joined USEC—to assure the corporation profitability and increase its value at privatization have systematically worked against the HEU deal. National security officials, skilled in negotiating agreements and wielding U.S. power in conventional ways, have either failed in their oversight of the commercial implementation at home, been misled, or simply been outvoted in the administration.

administration.

While some administration officials now take the position that the United States has no financial responsibility for the HEU deal, and that Russia must simply take what it can get, the 1993 agreement is quite clear that the ultimate responsibility belongs to the governments. The agreement specifies that the "[commercial] terms (including price), shall be subject to approval by the Parties." The United States committed to "use the LEU converted from HEU in such a manner as to minimize disruptions in the market and maximize the overall economic benefit for both Parties." Such provisions show the responsibility of both governments to manage carefully the commercial implementation of the HEU deal. From the Russian perspective, the United States has failed to do so.

The Uranium Problem

While the United States is committed under the government to government agreement to purchase LEU from Russian HEU and the initial contract was for the purchase of LEU, that is not how things have turned out. The Russian LEU contains two inputs of value: the natural uranium (as uranium hexafluoride, or UF_6) and the "enrichment" services (measured in separative work units, or SWUs).

The current problem is that Russia is not being paid for the uranium component, which is a state asset of the Russian government, like gold. The enrichment component is being purchased by USEC, with that money going to MINATOM. Because it is not possible to ship a SWU (except as an input of enriched uranium) and because Russian law prohibits export of state assets without a contract for sale and payment within 180 days, LEU derived from HEU cannot be exported from Russia without a uranium sales agreement. Thus, the whole HEU deal rests on finding a workable solution to the uranium problem.

The uranium problem has been present from the beginning of the deal. Following the intergovernmental agreement, an implementing contract for the HEU deal was negotiated with MINATOM and TENEX by DOE Deputy Assistant Secretary Philip Sewell in May 1993. That contract called for DOE to purchase Russian LEU but to pay immediately only for the enrichment component. The uranium component (actually, an equivalent amount of feedstock material that USEC customers had previously delivered for enrichment) was to be paid for when USEC "used or sold" the uranium equivalent or at the conclusion of the deal, which might be as late as 2013. At the time the contract was negotiated, it was expected that USEC would be assigned the contract after the company came into existence in July 1993. Indeed, Sewell left government for USEC several months later and the final contract was signed by USEC and TENEX at the January 1994 Moscow summit.

This defective LEU purchase contract, which Russia contends did not carry out the intent of the 1993 agreement, was designed more to benefit the commercial interests of USEC than to implement the intergovernmental agreement. USEC would get control of the uranium component of Russia's LEU without having to pay for it until the company wanted to. Of course, USEC would not be able to resell the accumulating inventory of displaced feedstock for some years because of trade restrictions on the sale in the United States of Russian uranium. USEC could have *used* the uranium for a process called "overfeeding," that is, using more uranium in the enrichment process to reduce consumption of electricity. DOE had been overfeeding the two gaseous diffusion plants it owned for years, a practice that was assumed to continue when the HEU deal was proposed. However, subsidies provided to USEC (in particular, DOE's below-market-value electricity contracts) eliminated incentives to overfeed and it soon became apparent that Russia would not get paid for its uranium anytime soon.

Thus, even from the beginning, the United States did not act to ensure payment to Russia for the uranium component of the LEU, which was estimated to be worth up to $4 billion over the course of the agreement. But USEC supporters were too clever by half: the corporation would, two decades hence, have to pay for the Russian uranium it held title to under the contract, a major liability that would interfere with the ultimate privatization of the corporation.

The uranium problem was addressed, but not fully solved, by the USEC Privatization Act, which Congress passed and President Clinton signed into law on April 26, 1996.< 2 > The legislation called for the United States to purchase the uranium component of the Russian LEU delivered in 1995 and 1996 and, overriding the defective LEU purchase contract, returned title to the uranium content (rather, the displaced uranium set aside by USEC) to Russia for it to sell on its own beginning January 1, 1997. To facilitate Russian uranium sales, the legislation overrode trade restrictions imposed on Russia in 1992 (as a result of an anti dumping action against uranium exporters from the former Soviet Union) by creating a new and gradually expanding quota for Russian sales of uranium to the United States.

By returning title of the displaced uranium to Russia, USEC was relieved of a $4 billion liability on its books, but Russia was left with a substantial amount of uranium to sell. When annual Russian LEU shipments to the United States are scheduled to reach 30 metric tons HEU equivalent in 1999, the uranium component will reach 9,000 metric tons (23.4 million pounds U_3O_8) annually. By comparison, the United States consumes about 17,000 tons of uranium each year, while other Western nations together consume about 36,000 tons.

Moscow will face serious obstacles to selling such large amounts of uranium in the current market. Both the United States and the European Community impose restrictions on the amount of Russian uranium that can be sold, and Japan is reluctant to buy Russian uranium because of ongoing territorial disputes with Moscow. In addition, because most utilities purchase uranium under long term contracts that cover requirements for several years forward, there is little near term market for new sales of any kind of uranium. Thus, Russia will not be able to sell its uranium directly to utility end users, but only to companies that are willing to purchase the uranium and hold it for future sales when market demand and trade restrictions allow.

On June 2, 1998, Russia reached a preliminary agreement with a consortium of three Western uranium companies (CAMECO of Canada, COGEMA of France and NUKEM of Germany) to purchase its uranium at USEC for a 10 year period, including the 11,000 tons remaining from LEU deliveries to USEC in 1997 and 1998. Under the preliminary agreement, Russia would receive payment promptly when the uranium contained in the LEU delivered to the United States was returned to Russian control at USEC. The companies offered to pay the going market price, less a profit margin when prices rose above $29 per kilogram of uranium (as UF_6).

For this deal to make commercial sense, the price of uranium would have to be expected to increase at a rate at least as great as the interest rate used to finance the purchase and holding of the uranium. Based on their own market analyses, the companies clearly believed that uranium prices would rise, particularly if the sale of the Russian uranium was handled responsibly, and that they would not have to hold the Russian uranium for more than a few years. After an extensive review, the Russian government approved the draft agreement by issuing a formal decree. In its own effort to be clever and put pressure on the companies to pay a minimum price in a final contract, MINATOM asked that the decree establish $29 per kilogram of uranium as the minimal acceptable price.

USEC Privatization

Unfortunately, just as Russia was approving its agreement with the uranium companies, the United States was completing its plans for USEC's privatization. Unbeknownst to all but those directly involved, USEC had convinced mid-level DOE and Office of Management and Budget (OMB) officials to transfer large amounts of DOE inventories of uranium to USEC to increase the company's value. The existence of this uranium was not generally known until May, when

amounts of DOE inventories of uranium to USEC to increase the company's value. The existence of this uranium was not generally known until May, when merger and acquisition bidders involved in USEC's privatization tried to find buyers for the uranium as part of their plans to finance the company's acquisition.

On May 20, the author alerted national security officials at the State Department and the National Security Council to the uranium transfers, and the potential negative implications for the HEU deal of USEC sales of uranium in competition with Russia. National security officials subsequently met with DOE and Treasury Department officials to discuss the implications of possible USEC uranium sales for the HEU deal. However, Treasury and White House officials pushing USEC privatization overruled any actions. The reasons given ranged from the parochial to the absurd: nothing could be done that might threaten the privatization, and government officials were forbidden to discuss any matters concerning USEC (even among themselves) during the "quiet period" mandated by the Securities and Exchange Commission (SEC). The latter turned out to be a fabrication—SEC rules apply only to company management's public disclosures and only *after* a securities offering is filed with the SEC. Neither was the case.

On June 26, Senator Pete Domenici (R-NM), who co authored the USEC Privatization Act, wrote to national security advisor Samuel Berger (with a copy to Secretary of the Treasury Robert Rubin) stating his concern that "sale of [the USEC uranium inventory] would negatively impact the sale of HEU Agreement derived natural uranium and could significantly reduce the Russian Federation's incentive to continue the [HEU] Agreement." Domenici concluded: "I have worked for over a decade to privatize the USEC. But if circumstances are different than what we have assumed, you need to take those new circumstances into account before a decision to privatize is made." Three days later, the Treasury Department proceeded to file the prospectus for the sale of USEC with the SEC, starting the countdown to the sale of USEC shares to private investors.< 3 > Domenici never received an answer to his letter.

If the president's highest national security advisor could, or would, do nothing, Secretary Rubin should have been in a position to weigh the foreign policy implications of USEC privatization against the domestic forces promoting privatization. But on June 24, Rubin delegated to the undersecretary for domestic finance the necessary authority for all matters relating to the privatization of USEC.< 4 > Whatever Rubin's reasons, he delegated the decision-making authority to the government's leading cheerleader for USEC privatization, a move that had the full support of more than 60 Wall Street investment firms set to profit from the sale of USEC.

The June 29 SEC filing confirmed not only the huge size of USEC's uranium stockpile, but also the fact that USEC was stockpiling additional uranium at one of the plants it was leasing from DOE by a process called "underfeeding."< 5 > To make matters worse, the SEC filing committed USEC to sell more than 60 million pounds of uranium on an accelerated schedule, before July 2005. A subsequent leak of an internal USEC planning document revealed plans to sell nearly 90 million pounds in this period, reaching a peak level of more than 22 million pounds in 2002.< 6 > If USEC and its administration supporters had intended to sabotage Russia's pending agreement with the three uranium companies, they could not have done more. USEC's planned sales totally changed the economics of any commercial deal to buy and hold Russian uranium. Not only would the holding time, and thus holding costs, increase, but the ultimate price received would be lower because of the additional supply to the market.

Perhaps coincidentally, DOE, under pressure from OMB (which strongly supported USEC privatization and DOE uranium transfers to the company), advanced a proposal in May to sell about 30 million pounds of its uranium inventories (in addition to that already transferred to USEC) between 1998 and 2003. New projections of uranium prices by industry analysts and the independent Energy Information Administration soon showed reductions of up to 40 percent in future uranium prices.< 7 > Not surprisingly, in the face of USEC plans and DOE uncertainties, the three Western companies re evaluated the draft agreement and informed Russian authorities it would have to be revised.

As USEC's privatization moved forward, Russia also made clear its serious reservations about the future of the HEU deal. On July 17, Russian Minister of Atomic Energy Yevgeniy Adamov wrote a letter to Domenici, who had visited Moscow in early July and discussed the deal with Russian officials. Adamov wrote:

We are not sure that after actual privatization USEC as a private company will be able to fulfill its commitments of the U.S. executive agent under this Agreement and ensure further acceptance and full payment for the low enriched uranium supplied.... We think that this constitutes deviation of the U.S. Party from the implementation of agreed provisions of the Agreement and affect its fulfillment. In such situation Russia will bear significant financial losses and this will result in strengthening the negative reaction of the Russian legislators both with respect to the implementation of this Agreement and other arrangements with the USA on the issues of nuclear arms control.

Adamov was undoubtedly referring to the opposition in the Russia Duma (the lower house of parliament) to the ratification of START II, to intrusive transparency and security measures, and pending legislation to end the HEU deal itself. Adamov's warning, which foreshadowed Yeltsin's threat to end the deal at the upcoming Moscow summit, should have made the dangers clear to the United States.

Additional interagency meetings on the HEU deal broke down because OMB officials insisted that President Clinton had approved a go ahead on privatization on July 25, 1997, and had not altered this order. In fact, Clinton reportedly had read a press article questioning privatization and forwarded it to his advisors, asking: "Are we sure we are doing the right thing?" Despite U.S. officials' prior knowledge of the impending problem and sober warnings from responsible Russian officials, the privatization juggernaut plowed on, raising questions about the source of the pressure to proceed at any cost, including U.S. national security interests. On July 28, USEC became a private company.

The Current Situation

At the Moscow summit, Clinton managed to dissuade Yeltsin from withdrawing from the HEU deal by assuring him that the United States would find a solution to the problems. Adamov and Energy Secretary Bill Richardson were appointed to coordinate the effort. However, Richardson was soon handicapped by differences within the administration about how to deal with the uranium feed issue. For a long time, White House officials steadfastly refused to consider a U.S. purchase of any part of the uranium feed component, arguing that Moscow must recognize that market circumstances had changed (even if the United States changed them) and therefore must settle for much less money from commercial buyers. In effect, these officials contended that the United States had no responsibility under the government-to-government agreement, and that Russia was on its own in the commercial implementation of the HEU deal.

This position arises from a fundamentally flawed assumption about the HEU deal. When it was first proposed, it was thought that the HEU deal would be "budget-neutral." At that time, it was the U.S. government, through DOE, that was to purchase the Russian LEU. DOE would then resell the LEU without requiring an appropriation by a Congress that was trying to balance the U.S. federal budget. It was thus politically and budgetarily necessary to assert that DOE would incur no costs when it entered into the contract. In fact, under government accounting rules for the enrichment enterprise, the HEU deal would not only be budget-neutral, but "profitable." The price the United States would pay for the uranium content of the Russian LEU would be recovered by reduced costs (according to government accounting rules at least) from overfeeding the enrichment plants, and the price paid for the SWUs would be far

below the full-cost recovery values attributed to operation of the enrichment plants.

In privatizing the U.S. enrichment enterprise and transferring large amounts of uranium, administration officials themselves destroyed the budget neutrality of the HEU deal. The transfer of below-market-value electricity supplies to the new government corporation and the failure to charge a capital cost per SWU for use of the enrichment plants not only destroyed any incentive to overfeed and thus buy the uranium, but also subsidized USEC production costs for SWUs so that they were below what was promised Russia. The privatization of USEC compounded this problem, since the private corporation—unlike the government corporation—must make a profit in reselling the Russian SWUs. As discussed below, it is now impossible to pay Russia a fair market value for its enrichment services. Transfer of amounts of uranium greater than was statutorily authorized and aggressive USEC uranium sales plans made it impossible for Russia to sell the uranium from HEU at prices even close to those originally agreed.< 8

If U.S. actions taken in connection with USEC privatization have altered not just the economic factors, but also the fundamental assumptions of the deal, it is important to ask what responsibilities the United States retains under the original government-to-government agreement. In the world of commercial agreements, the answer would be clear: the United States would be obligated to compensate Russia for any lost income. Of course, Russia lost the Cold War and is desperate for money. Perhaps U.S. officials believe Russia will just have to accept the dictates of the victors.

For its part, Russia holds the United States responsible for purchasing the LEU and will not continue to ship without payment. Russia is undoubtedly counting on the importance of the HEU deal to the United States to force a resolution. However, this is a dangerous game of brinkmanship: Washington may push Moscow so far that it is impossible to revive the deal. The inability of policy makers to perceive the consequences of their actions, or inaction, or to act to fix things, does not give confidence. Nor is it easy to identify anyone in Russia who would champion a resumption of the deal once it ended.

Domenici's Proposal

In a September 8 letter to Clinton, Domenici wrestled with this dilemma and came down on the side of prudence. Commenting that he did not think Russia could bend further on terms and that changed political circumstances in Russia would make it difficult for ministries involved to accept much lower prices, Domenici suggested that the United States take partial responsibility for the situation and intervene in a limited way.

Under Domenici's proposal, the United States would, in effect, purchase about 28 million pounds of uranium from Russia's 1997 and 1998 LEU shipments—at a cost of about $300 million—*conditional* on Moscow reaching a long term commercial agreement for the uranium component of its future deliveries. The United States would hold the Russian uranium and remaining DOE stocks of uranium off the market for 10 years. The hope was that removing an estimated 58 million pounds of uranium from the market (28 million pounds of Russian uranium and 30 million pounds of DOE inventory) would partly reverse the negative market impact of uranium transfers to USEC. Domenici also called for the United States to define terms for returning the uranium component of the LEU to Russia for use in the blending down of HEU or as fuel in Soviet design reactors in Russia and elsewhere.

Essentially, Domenici invited Clinton to join in a bipartisan effort to strengthen the HEU deal and signaled congressional receptiveness to a budget request under the president's emergency appropriation powers. Such a presidential request would not be unusual; Congress finally settled on more than $20 billion of such emergency requests. On September 22, Richardson and Adamov, meeting in Vienna, issued a joint report on the status of implementation of the HEU deal.< 9 The framework proposed in the report was intended to facilitate a purchase agreement between Russia and the Western companies. The framework included most of the Domenici proposal, but no commitment to purchase the uranium from 1997 and 1998 deliveries. Subsequently, after a great debate at high levels, the administration agreed to accept a congressional appropriation of $325 million for the 1997 and 1998 deliveries, which was passed into law on October 21.

The resolution of the uranium problem is still uncertain. Russia continues to insist on prices for its uranium that are now significantly above market and refuses to recognize that commercial buyers will have to pay even lower amounts due to the high costs of holding the uranium until market and trade conditions allow it to be resold. Some in the administration still resist spending the funds authorized by Congress and seem unwilling to accept limits on DOE sales of uranium. Between Russian inflexibility, administration equivocation, and worsening uranium market conditions, it will be hard to reach a commercial deal that relieves the United States of all future responsibility for the HEU deal.

The Future of the Deal

If the uranium problem can be solved, the next challenge to the HEU deal will come from USEC's obligation to pay Russia for the enrichment component of its LEU deliveries. As a government owned corporation, USEC was—at least in principle—under the control of the U.S. government. The United States could ask USEC to pay for Russian enrichment services even if the cost was greater than the company's own cost of production and the corporation made no profit on the Russian SWUs. With privatization, USEC has no strong incentives to continue its role in the HEU deal. In fact, according to revelations in its SEC filing, USEC has a strong incentive to quit its role and even to seek to end the HEU deal.

Moreover, even when it was a government-owned corporation, USEC put its business interests ahead of the HEU deal. In 1996, Russia asked USEC to increase its 1997 purchases of LEU from 10 tons HEU equivalent to 18 tons. According to a protocol, or summary, of discussions in Moscow in July (in which no non-USEC U.S. government official participated), "USEC responded that because of power and labor commitments and level of demand for SWUs, this could not be done in 1997," offering instead to purchase the HEU equivalent of 12 tons.< 10 USEC officials asked U.S. government officials to approve the 12 ton level, but failed to inform them of the Russian offer to deliver more. Russian officials naturally assumed that USEC was speaking on behalf of the U.S. government. Without outside intervention, Washington might never have detected this subversion of the HEU deal.

The dominance of USEC's commercial interests has been amplified by privatization, enrichment market developments and continued ineffective oversight by government officials. According to the company's SEC filing: "Unit costs of SWU purchased under the Russian HEU Contract are substantially higher than the Company's marginal cost of production." Increasingly large volumes of Russian SWUs result in USEC having to operate its two enrichment plants at inefficient levels, raising unit costs on the SWUs that USEC does produce. The plants are most efficient at a production level of about 13 million SWUs per year. USEC sells 11 million to 13 million SWUs per year, but, by next year, Russian LEU deliveries will reach 5.5 million SWUs, meaning that USEC will have to operate its plants far below their optimum production levels.

Meanwhile, USEC's portfolio of old high priced SWU contracts, inherited from DOE, are ending and market prices for new contracts are declining. Under its present contract with Russia, USEC must, in 1999, pay about $88.90 per SWU (including transportation)—more than the current price for new SWU contracts, implying that USEC must market Russian SWUs on which it can make no profit. When USEC was owned by the U.S. government, the United States could simply tell USEC to buy and resell the SWUs even if it did not make a profit. Obviously, privatization has changed this; private shareholders demand a profit.

Thus, the best outcome, by far, for USEC is for the HEU deal to fail entirely; that is, for the Duma or the Russian government, in nationalistic frustration, to

stop exporting its sensitive national treasure. Based on the above SWU-cost factors and the higher prices expected for uranium if Russian uranium were kept from the market, USEC's profits would be approximately three times as high as at present if the HEU deal ended completely.< 11 USEC's private investors and the Wall Street firms that still hold stock could see an increase in their return on investment from about 7 percent to 22 percent, or, equivalently, a trebling of share price.

The transfer of large amounts of uranium to USEC by its administration supporters, together with USEC leaks of aggressive sales plans, nearly caused an end to the HEU deal on September 2. Failure of the United States to ensure payment for Russia's uranium may yet guarantee that result. Given declining SWU prices and increased deliveries, it is inevitable that USEC will seek a deferral of Russian SWU purchases and a substantial reduction in the price paid to Russia to ensure the company's profitability. The U.S. government would either have to explain to Russia why it has to sell at a price well below the market price—so a private American company can make a profit—or subsidize that profit from taxpayer funds. Of course, it may not come to such a clear conclusion: there are many ways to frustrate performance of a contract to the point that Russia finds continuing the HEU deal unacceptable.

Solutions

The United States must recognize that its own actions have severely undermined the HEU deal and that the assumption that the deal can be accomplished at no net cost to the United States is a serious mistake. In subsidizing and otherwise biasing USEC financial incentives against the SWU part of the deal and by transferring large amounts of uranium to the corporation without limits on sales, Washington may have increased the value received by the Treasury Department for USEC's sale but created a threat to national security that will most likely require continued expenditure of funds to alleviate. But even if the United States cannot shift the entire cost of the deal to the private sector, the HEU deal is a good buy, perhaps the most cost effective national security initiative in history. Trillions of dollars were spent in the Cold War to counter the threat of tens of thousands of Soviet nuclear weapons. If the United States can forever remove large numbers of such weapons from the world for less than the cost of one B-1 bomber, it will be money well spent.

There are several immediate tasks for the administration. The first is to use the uranium-funding "carrot" provided by Congress to secure the best possible long-term commercial agreement for the sale of Russian uranium beginning in 1999, and to formalize such an agreement in a way that ensures that it will continue in the future. To do so, the United States needs to convince Russian officials to be realistic about market conditions and the low salability of its large volumes of uranium, recognizing the Russian complaint that U.S. actions—from USEC transfers to trade restrictions—have significantly worsened the market situation for Moscow.

The second is to improve U.S. oversight over the HEU deal to a level commensurate with its national importance and U.S. commitments under the intergovernmental agreement. The president appointed an interagency oversight committee, but it has failed to recognize problems and take timely action. This failure is due partly to inadequate staffing and lack of information, partly to the inattention by national security officials preoccupied with other crises, and partly to the lack of influence of national security advisors in the White House policy process.

An immediate need is better information about what is happening in the HEU deal. The memorandum of agreement between the U.S. government and USEC defers excessively to USEC commercial interests.< 12 The United States should not depend on limited self reporting by the corporation about what is happening in the HEU deal. USEC's position, endorsed by the agreement, is that all information connected with the HEU deal is proprietary, preventing public as well as government scrutiny of developments—including those initiated by USEC—that involve profound public and national security interests. In short, privatizing USEC appears to have resulted in the privatization of an important aspect of U.S. national security. At the very least, a U.S. government observer should participate in all negotiations and meetings relating to the HEU deal and all documents should routinely be provided to a more knowledgeable and attentive oversight process.

With regard to the impending SWU problem, the United States could take several actions to alter USEC's economic incentives so that it was more willing to continue the HEU deal. After all, the United States owns the enrichment plants that USEC leases for only a few million dollars a year, and DOE holds the below market-value electricity contracts that benefit the company. One measure would be to increase power costs; another would be to impose an increasing fee per SWU for use of the enrichment plants above a certain level of production, so that USEC would have to pay more to produce SWUs that would otherwise replace Russian SWUs. Such a fee would also correct the artificial incentives that lead USEC to underfeed its enrichment plants and thus accumulate more uranium. If this cannot be done, the United States should itself (through DOE, for instance) replace USEC as executive agent for the HEU deal, taking over direct relations with Russia and reselling Russian SWUs to the highest bidders. If politically necessary, USEC might be given a right of first refusal to purchase the Russian SWUs.

Alternatively, while one must always be wary of institutional invention, creating a government owned corporation that could take on nuclear security tasks on a multi year basis, without the constraints of annual budget cycles and with a certain amount of commercial intelligence and flexibility, offers a number of advantages. Indeed, USEC was not a bad idea in principle; it was largely the pursuit of privatization and inadequate supervision that led to problems. The creation of a USEC II, for example, would provide the United States with a vehicle with which to bargain with both Russia and commercial parties to achieve the most efficient implementation of the HEU deal, including the ability to enter into long term commercial agreements that are impossible for government agencies. Such a government-owned corporation could also take on other post-Cold War tasks, including those relating to plutonium disposition, securing (including by direct purchase) smaller quantities of HEU and plutonium at diverse sites across the former Soviet Union, and other nuclear security matters that require sustained attention and funding.

USEC has built a full-scale pilot of the Atomic Vapor Laser Isotope Separation facility at Lawrence Livermore National Laboratory in northern California. Shown here are three full-scale separators, one of which is capable of operation.

Process: *USEC took over AVLIS research in '68*

From Page 1A

lion nuclear fuel plant that would employ 1,300 people or more.

United States Enrichment Corporation, the new owner of the AVLIS technology says that the process is almost ready.

But a number of industry observers say they have doubts about the technology's readiness, the need for new nuclear fuel plants, USEC's ability to pay for the plant, and the company's ability to win a license from the federal Nuclear Regulatory Commission.

USEC, based in Bethesda, Md., took over research into AVLIS in 1998 when the former Energy Department operation was sold to the public in a stock offering. USEC produces 40 percent of the nuclear fuel used worldwide. USEC has built a full-scale AVLIS pilot production line at Lawrence Livermore National Laboratory in California.

The doubt that settled over the project in its earlier stages like a fog still hasn't been burned off by USEC's site shopping. Such doubts aren't only important to whether Fort McClellan or some other area will get a major investment. They are also important because USEC has staked its investment appeal on a promise of increased profits through the revolutionary technology.

Elizabeth Stuckle, a spokeswoman for USEC, said the doubts aren't surprising, considering the program's long history.

"I think that's understandable, considering the many, many years that have gone into this," she said.

But Ms. Stuckle said USEC wouldn't be looking for a site if the technical problems hadn't been conquered.

"Obviously if we are in the siting process, we are confident enough that AVLIS is going to be deployed."

AVLIS is a major part of the appeal of the new company. Its stock opened with a whimper last year, not rising above the initial offering price of $14.25 per share.

"USEC's managers have been Pacific Gas and Electric, a California utility, for 23 years. He helped examine USEC for another company that considered buying USEC before the stock sale last year.

Julian Steyn, president of Energy Resources International, another consulting firm, called the current AVLIS test "more than academic, but not industrial."

That's the rub. No one disputes that AVLIS works in laboratory conditions, but several experts say they're not sure they would build a large factory around what they see as a fragile prototype technology prone to breakdowns.

"If it's not able to run on a continuous basis, the economics are going to be unacceptable," Witzell said

That would sap AVLIS' promise of more efficient preparation of nuclear fuel. Currently USEC enriches fuel at decades-old plants in Kentucky and Ohio that guzzle huge amounts of electricity. The laser process is envisioned to use one-tenth the electricity of the current plants.

Natural uranium contains only about 0.7 percent uranium-238, the type that can be split in a reactor to create energy. The rest is inert uranium-235. Power reactors need fuel that is between 3 percent and 5 percent U-238.

AVLIS takes bars of uranium metal and vaporizes them with a high-powered electron laser. Then another laser is fired to give a magnetic charge to the desirable U-235 atoms. Once charged, they are pulled to one side of the chamber by a magnetic field. The atoms then collect as small clumps of metal.

The details of AVLIS' exact specifications are trade secrets, but Witzell and Lindeman said USEC has suffered AVLIS component failures.

"They have, in their last two production runs, had mechanical problems," Lindeman said.

Dr. Thomas Neff, a senior research scientist at the Massachusetts Institute of Technology, said USEC's pilot facility doesn't push much uranium is worth it hinges on predicting whether nuclear power has a future. If oil and coal continue to be cheap, the high cost of a nuclear power plant looks bad.

"In the next 10 to 20 years, a lot of plants are going to be shut down," Lindeman said.

Plants in the United States, USEC's most important market, and Europe also face unbudging opposition from environmentalists. Most American plants will have to have their licenses renewed by the Nuclear Regulatory Commission in the next decade. If high operating costs or public opposition lead them to pull the plug, USEC's market could collapse.

"I'm not sure there's any good financial reason to do this," said Lindeman, who believes that in a declining market, the high electrical costs of the current plants might be cheaper than taking on debt for AVLIS.

But brighter pictures can be summoned from the crystal ball. Oil-, gas- and coal-fired plants produce carbon dioxide, which contributes to global warming. Nuclear plants don't produce carbon dioxide.

As utility deregulation continues in the United States, it could spur demand, making existing nuclear plants more attractive to operate. Also, developing nations in Latin America and Asia could increase their reliance on nuclear power. Additional reactors are expected or under construction in India, China, South Korea, Japan and Taiwan, according to industry publications.

For Schanzer, the future of nuclear power is bright, even in the United States.

"I do believe that at some point in time, even the plants in mothballs will be taken out and used," he said.

Schanzer said USEC will be able to borrow the money to build an AVLIS plant.

"I can say with complete honesty that the financial community is prepared to provide the necessary capital to see the project is done," he said.

But Steyn, the consultant, thinks that USEC will have to find a partner of some kind to share the burden

relying on AVLIS to attract investors," said Eric Lindeman, director of Washington Nuclear Corporation, a consulting firm and newsletter publisher.

Over the short term, USEC's prospects appear rather ordinary to Dave Schanzer, analyst for Janney Montgomery Scott, a New York investment firm. But he thinks that when AVLIS is up and running, and the high costs from USEC's two older enrichment plants are gone, the company could have a 15 percent to 20 percent profit margin every year.

John Rezai, director of research in Baltimore for another investment firm, Blaylock and Partners, agrees.

"AVLIS kind of represents the home run in terms of the investment community in regards to USEC," Rezai said.

That enthusiasm could be misplaced if AVLIS is delayed or doesn't go forward. If analysts sour on the project, it could also affect the company's ability to borrow money for it.

"There's a real question of whether the process will work for commercial application," said Ron Witzell, a consultant to the electric industry.

Witzell was fuel manager for

Fort McClellan is one of more than a dozen sites being considered by USEC for a $2 billion uranium fuel plant. Shown here is an architect's rendering of such a full-scale plant.

vapor through the chamber. Neff said pushing more vapor through will mean that more U-235 and U-238 atoms will mix and collide, making it harder to keep them apart.

"It's mostly an engineering problem," Neff said. "The physics of it work against you."

Analysts who follow USEC's stock are somewhat more bullish on the company than nuclear industry consultants and observers. But even they recognize AVLIS is not yet a done deal.

"The question that is left is can the technology be brought up to scale at a cost acceptable to USEC?" asked Schanzer, the stock analyst.

To Mike Knapik, chief editor of Nuclear Fuel, the answer is no. Thus the site selection process is a joke intended only to keep investors interested in USEC.

"There's almost a charade of selecting a site, but they'll never actually build a facility," Knapik said.

But Ms. Stuckle said that, from the company's perspective, all the major hurdles have been crossed, and those remaining are minor.

"The (research and development) part is over," she said. "We're in what would be called the fine-tuning phase."

Even if the technical problems can be overcome, Lindeman and others still ask why USEC wants to go forward. Sure, AVLIS will make enriching uranium fuel cheaper. But that won't mean anything if the company takes on a big debt only to find it no longer has any customers.

Deciding whether the debt because it already has $550 million in debt.

USEC officials say cash flow is strong, and the company can handle more debt. Officials also say USEC can sell some of its hoard of raw uranium that the Energy Department transferred to it at the time of privatization.

Finally, when the technology is ready and the money is in hand, USEC will have to win a license from the Nuclear Regulatory Commission, or NRC.

Ms. Stuckle, the USEC spokeswoman, said the company is already talking to the commission about licensing, and that it has gained experience when the commission licensed the Kentucky and Ohio plants at the time of privatization.

"We feel that the licensing process will go rather expeditiously with the NRC," she said.

The commission, in a report to Congress on the two current USEC plants, acknowledged it is preparing for the AVLIS licensing procedure.

"The AVLIS project will present some unique and highly complex issues for NRC review," the report said.

Knapik interprets that statement differently than Ms. Stuckle. He predicted NRC licensing proceedings for AVLIS would look like the seven-year battle over an enrichment plant proposed for northern Louisiana using European technology. That application was dropped last year when the European group gave up.

"I think licensing would be much more problematic than (in Louisiana)," Knapik said.

Knapik's and Ms. Stuckle's expectations are the extremes. Most expect a rough, but not impossible slog, with lots of intervention by outside environmental groups.

"I don't think they will have a hard time. It is, however, a new process for the NRC to evaluate " Steyn said. "I'm sure the activists will help the NRC come up with some tough questions."

2007 (March 21) - Uranium Investing Conferences Focus on Picking Market Winners

See [HX0003][GDrive]

VANCOUVER, BC -- U3O8 Media Inc., in association with Carriere Consulting Group and Academy & Finance SA, are pleased to present Uranium Investor Forums in Zurich (March 27, 2007) and Geneva, Switzerland (March 29, 2007).

*Experts, including **Dr. Thomas L. Neff**, senior researcher at MIT's Center for International Studies since 1975 and **President of Nuclear Security Associates, LLC**, will provide valuable information to help investors understand the uranium industry, uranium supply and demand to 2025, and the relation between production and uranium enrichment, and the investment opportunities in enrichment capabilities.*

Investors will also hear from experts on subjects ranging from U.S. uranium consumption, factors likely to influence U.S. nuclear power plant construction, the ever-changing political climate toward nuclear energy and what new opportunities have been created by the trend toward nuclear energy in the U.S. International investors will learn how to invest and benefit from these trends by investing in uranium exploration and development companies.

In addition, forum attendees will learn about investment opportunities in promising junior, mid-tier and near-production uranium companies. Senior executives from ten of the fastest growing uranium companies will be on hand to answer investor questions about investing in the burgeoning uranium exploration industry.

"We are pleased to be involved in these important conferences that are designed to assist investors profit from the rapidly growing uranium market," says John Gomez, President U3O8 Media Inc.

"Investors will gain insight on the market from industry experts and have the opportunity to meet with management of some of the world's most dynamic uranium companies."

The ten invited participating companies are Augen Capital Corp. (TSX-V: AUG), Bayswater Uranium Corp. (TSX-V: BAY), Crosshair Exploration & Mining Corp. (TSX-V: CXX), Forum Uranium Corp. (TSX-V: FDC), Forsys Metals Corp., Monster Copper Corp., Powertech Uranium Corp., Strathmore Minerals Corp., Uranium Energy Corp., and Xemplar Energy Corp.

March 22, 2007 - Lack Of Fuel May Limit US Nuclear Power Expansion - MIT

See [HW000U][GDrive]

Limited supplies of fuel for nuclear power plants may thwart the renewed and growing interest in nuclear energy in the United States and other nations, says an MIT expert on the industry.

Over the past 20 years, safety concerns dampened all aspects of development of nuclear energy: No new reactors were ordered and there was investment neither in new uranium mines nor in building facilities to produce fuel for existing reactors. Instead, the industry lived off commercial and government inventories, which are now nearly gone. worldwide, uranium production meets only about 65 percent of current reactor requirements.

*That shortage of uranium and of processing facilities worldwide leaves a gap between the potential increase in demand for nuclear energy and the ability to supply fuel for it, said **Dr. Thomas Neff**, a research affiliate at MIT's Center for International Studies.*

"Just as large numbers of new reactors are being planned, we are only starting to emerge from 20 years of underinvestment in the production capacity for the nuclear fuel to operate them. There has been a nuclear industry myopia; they didn't take a long-term view," Neff said. For example, only a few years ago uranium inventories were being sold at $10 per pound; the current price is $85 per pound.

Neff has been giving a series of talks at industry meetings and investment conferences around the world about the nature of the fuel supply problem and its implications for the so-called "nuclear renaissance," pointing out both the sharply rising cost of nuclear fuel and the lack of capacity to produce it.

Currently, much of the uranium used by the United States is coming from mines in such countries as Australia, Canada, Namibia, and, most recently, Kazakhstan. Small amounts are mined in the western United States, but the United States is largely reliant on overseas supplies. The United States also relies for half its fuel on Russia under a "swords to ploughshares" deal that Neff originated in 1991. This deal is converting about 20,000 Russian nuclear weapons to fuel for U.S. nuclear power plants, but it ends in 2013, leaving a substantial supply gap for the United States.

Further, China, India, and even Russia have plans for massive deployments of nuclear power and are trying to lock up supplies from countries on which the United States has traditionally relied. As a result, the United States could be the "last one to buy, and it could pay the highest prices, if it can get uranium at all," Neff said. "The take-home message is that if we're going to increase use of nuclear power, we need massive new investments in capacity to mine uranium and facilities to process it."

Mined uranium comes in several forms, or isotopes. For starting a nuclear chain reaction in a reactor, the only important isotope is uranium-235, which accounts for JUST 7 out of 1000 atoms in the mined product. To fuel a nuclear reactor, the concentration of uranium-235 has to be increased to 40 to 50 out of 1000 atoms. This is done by separating isotopes in an enrichment plant to achieve the higher concentration.

As Neff points out, reactor operators could increase the amount of fuel made from a given amount of natural uranium by buying more enrichment services to recover more uranium-235 atoms. Current enrichment capacity is enough to recover only about 4 out of 7 uranium-235 atoms. Limited uranium supplies could be stretched if industry could recover 5 or 6 of these atoms, but there is not enough processing capacity worldwide to do so.

Japan Slipping out of control

CONTINUED FROM A1

In the first hint of international frustration at the pace of updates, Yukiya Amano, director general of the International Atomic Energy Agency, said he wanted more timely and detailed information.

"We do not have all the details of the information so what we can do is limited," Amano told a news conference in Vienna. "I am trying to further improve the communication."

Several experts said that Japanese authorities were underplaying the severity of the incident, particular on a scale called INES used to rank nuclear incidents. The Japanese have so far rated the accident a four on a one-to-seven scale, but that rating was issued on Saturday and since then the situation has worsened dramatically.

"This is a slow-moving nightmare," said Dr. Thomas Neff, a research affiliate at the Center for International Studies, which is part of the Massachusetts Institute of Technology. "This could be a five or a six — it's premature to say since this event is not over yet."

France's nuclear safety authority ASN said Tuesday it should be classed as a level-six incident.

Japanese Prime Minister Naoto Kan on Tuesday urged people within 30 kilometres of the facility — a population of 140,000 — to remain indoors, as authorities grappled with the world's most serious nuclear accident since the Chernobyl disaster in Ukraine in 1986.

Officials in Tokyo said radiation in the capital was 10 times normal at one point but not a threat to human health in the sprawling high-tech city of 13 million people.

The best advice experts could give them was to stay indoors, close the windows and avoid breathing bad air — steps very similar to those for handling a smog alert or avoiding influenza.

While these steps may sound inconsequential, experts said the danger in Tokyo, while worrisome, is slight — at least for now.

"Everything I've seen so far suggests there have been nominal amounts of material released. Therefore, the risks are generally low to the population," Jerrold Bushberg, who directs programs in health physics at the University of California at Davis, said in a telephone interview.

Winds over the plant will blow from the north along the Pacific coast early today and then from the northwest towards the ocean during the day, the Japan Meteorological Agency said.

Fears of trans-Pacific nuclear fallout sent consumers scrambling for radiation antidotes in the U.S. Pacific Northwest and Canada. Authorities warned people would expose themselves to other medical problems by needlessly taking potassium iodide in the hope of protection from cancer.

The nuclear crisis and concerns about the economic impact from last week's earthquake and tsunami have hammered Japan's stock market.

The Nikkei index was up over five per cent in early trading today after ending down 10.6 per cent on Tuesday and 6.2 per cent the day before. The fall wiped some $620 billion off the market.

Authorities have spent days desperately trying to prevent the water which is designed to cool the radioactive cores of the reactors from evaporating, which would lead to overheating and the release of dangerous radioactive material into the atmosphere.

"The possibility of further radioactive leakage is heightening," a grim-faced Kan said in his address to the nation on Tuesday.

"We are making every effort to prevent the leak from spreading. I know that people are very worried but I would like to ask you to act calmly."

The plant operator, Tokyo Electric Power Co., pulled out 750 workers, leaving just 50, and a 30-kilometre no-fly zone was imposed around the reactors.

There have been no detailed updates on what levels the radiation reached inside the exclusion zone.

Despite pleas for calm, residents rushed to shops in Tokyo to stock up on supplies. Don Quixote, a multi-storey, 24-hour general store in Roppongi district, sold out of radios, flashlights, candles and sleeping bags.

Several embassies advised staff and citizens to leave affected areas in Japan. Tourists cut short vacations and multinational companies either urged staff to leave or said they were considering plans to move outside Tokyo.

German technology companies SAP and Infineon were among those moving staff to safety in the south.

SAP said it was evacuating its offices in Tokyo, Osaka and Nagoya and had offered its 1,100 employees and their family members transport to the south, where the company has rented a hotel for staff to work online.

"Everyone is going out of the country today," said Gunta Brunner, a 25-year-old creative director from Argentina preparing to board a flight at Narita airport. "With the radiation, it's like you cannot escape and you can't see it."

Japanese media have became more critical of Kan's handling of the disaster and criticized the government and the nuclear plant operator for their failure to provide enough information on the incident.

Kan himself lambasted the operator for taking so long to inform his office about one of the blasts on Tuesday, Kyodo news agency reported.

Kyodo said Kan had ordered TEPCO not to pull employees out of the plant. "The TV reported an explosion. But nothing was said to the premier's office for about an hour," a Kyodo reporter quoted Kan telling power company executives.

"What the hell is going on?"

BY THE NUMBERS

The following is a list of the likely impact of and response to the devastating earthquake and tsunami that rocked the northeast coast of Japan on Friday, and subsequent crisis at nuclear power plants.

DEATH TOLL
The death toll is expected to exceed 10,000, with northeastern prefectures of Miyagi, Iwate and Fukushima most severely hit. At least 3,570 people were confirmed dead, but 7,558 people are still missing, Japan's NHK public broadcaster says.

PEOPLE EVACUATED
More than 440,000 people have been evacuated, NHK says. Hundreds of people are waiting for help in isolated areas and have no access to food.

PEOPLE WITHOUT ELECTRICITY, WATER
About 850,000 households in the north are still without electricity in near-freezing weather, Tohuku Electric Power Co. says. The government says at least 1.5 million households lack running water.

BUILDINGS DAMAGED
More than 76,000 buildings have been damaged, including at least 6,300 completely destroyed, NHK says.

IMPACT ON ECONOMY
Citigroup expects 5-10 trillion yen ($60-120 billion) in damage to housing and infrastructure, while Barclays Capital estimates economic losses of 15 trillion yen ($180 billion) or three per cent of Japan's GDP.

UBS expects Japan's economy to grow 1.4 per cent this year, compared with its previous forecast of 1.5 per cent expansion.

But it upgraded its growth forecast for 2012 to 2.5 per cent, up from the previous estimate of 2.1 per cent.

COUNTRIES OFFERING AID
According to Japanese foreign ministry, 102 countries and 14 international organizations have offered assistance. Teams from 14 countries/regions have arrived or already left for Japan.

2014 Article in Lewis & Clark college magazine

See [HE000B][GDrive]

Like most Americans born in the 1940s, Thomas Neff BA '65 remembers the "duck-and-cover" days. He recalls the siren tests, the Civil Defense ads, the emergency broadcast system, and Life magazine stories about nuclear fallout shelters. This was the national Cold War anxiety that Neff absorbed as a child in Portland, where his father taught at Lewis & Clark.

Even though Neff says Portland was "kind of remote" in the 1950s, "we had to go through all these nuclear attack drills in grade school and high school. At the time, I really didn't understand how getting under my desk was going to do any good."

Thomas Neff Decades later, as the Cold War angst of Neff's youth was defused by détente, a different form of nuclear anxiety emerged. As the Soviet Union broke apart, many feared that cash-strapped Russia would sell or lose control of thousands of "loose nukes" then deployed across the former Soviet Union—and that its underemployed nuclear scientists and technicians would offer their knowledge and skills to the highest bidder. Nuclear weapons expert Rose Gottemoeller—now under secretary of state for arms control and international security—describes American policy-makers in 1991 as fearing "nuclear mayhem."

For Tom Neff, it was not a time to duck and cover. A scheme he proposed in an October 24, 1991, New York Times op-ed became a win-win solution to the nuclear weapons problem. And not only did he conceive of it, he put himself in a position to pitch it to a key Soviet official—a meeting that came about both by chance and by design.

Neff's idea was so simple that it was almost dismissed as an impossibility by Washington. In essence, he based his plan on Russia's economic self-interest. Neff calculated that the highly enriched uranium in a typical nuclear weapon could be "blended down" to make low-enriched fuel for nuclear reactors that was worth about $500,000 per weapon. If the United States were to buy this fuel, the Russians would be motivated to continue guarding their massive arsenal and paying their many nuclear scientists and technicians—not to build and maintain nuclear weapons but to dismantle them.

Under Secretary Gottemoeller calls Thomas Neff "the genius who pulled this whole thing together in a very skillful way. He had the idea, communicated it well, and sold it to top people on both sides." Neff was "the complete package in terms of crystallizing the concept. Although there were years of implementation work and some difficult issues to work out, the idea itself was inherently so good that it survived all of this. And it has fulfilled its original promise—an amazing nonproliferation program with important benefits for both sides."

*"Thomas Neff was the genius who pulled this whole thing together. He had the idea, communicated it well, and sold it to top people on both sides."***Rose Gottemoeller***Under Secretary of State for Arms Control and International Security*

During the next 22 years—with Tom Neff's constant attention —what came to be called the Megatons to Megawatts program actually worked. More than 20,000 Russian warheads—any one of which could have destroyed an American city—were converted into U.S. electricity, a deal ultimately worth $17 billion.

The final shipment of Russian fuel-grade uranium arrived in Baltimore in late 2013. Shortly thereafter, the Bulletin of the Atomic Scientists reported the little-known fact that "nearly half of the uranium burned in U.S. power plants during the past 20 years came from decommissioned Russian weapons." This fuel supplied roughly 10 percent of all U.S. electricity during that period. And while the United States and Russia continue to spar today in what some have called a new Cold War, those nukes never got loose.

Neff, who is currently writing a book about his experiences, remembers 1950s Portland as a working-class town where "everybody around me was pretty much blue collar, working on just getting through life." **His father taught business courses at Lewis & Clark and was a small-time entrepreneur—starting several businesses and managing an apartment house that he built in nearby Lake Grove (now Lake Oswego).**

Tom went to work at an early age, picking berries and beans. "Before migrant labor," he recalls, "they let school out to pick the crops. By the time you were 12, the school bus would come and take you to the fields. You'd see all your classmates on the bus, and from 7 a.m. to 3 p.m. you'd pick—a nickel a flat for strawberries."

A good student, Neff graduated from Lake Oswego High School in 1961. He applied to Harvard, but his father wouldn't fill out the financial aid forms. As a result, Neff ended up living at home and attending Lewis & Clark tuition free due to his father's position. At the college, he took a wide range of courses while majoring in math and physics. He feels privileged to have had Elvy Fredrickson as a mathematics professor, observing that "she could have been at MIT or Stanford." (Fredrickson taught at Lewis & Clark from 1946 until 1980. She passed away in 2008.)

A key mentor was Robert Dusenbery, a published poet who built the college's English department in the decades following World War II, hiring fellow poets

William Stafford and Vern Rutsala, both of whom taught Neff. Dusenbery stopped Neff on campus during the fall of his senior year to ask whether he might nominate him for a Danforth Fellowship—a full graduate-school scholarship. It turned out to be Neff's long-awaited ticket out of Portland. After graduating at the top of his class in 1965, he moved to California to begin a doctoral program in physics at Stanford University

So how does a Cold War kid from Portland end up imagining a key international deal that ends up destroying one-third of the world's nuclear weapons arsenal? How did Thomas Neff become the right person in the right place at the right time— with such an elegant but practical idea? Looking back, nearly every aspect of his intellectual and social formation seemed to contribute to his being the right person. And every twist of his career seemed to carry him toward the right time and place— his October 19, 1991, encounter with Viktor Mikhailov, deputy minister of atomic power and industry and head of the Soviet nuclear weapons complex.

Academically at Stanford, he says, "I was in way over my head." (He had actually completed his physics major at Lewis & Clark through self-study and a set of examinations.) The summer before leaving for Palo Alto, he says he acquired the physics books that were being used at Stanford and "worked through them."

"It was the math I got at Lewis & Clark that saved me," he says with a nod to Professor Fredrickson, "along with good physical intuition." He earned a PhD in 1973 and went on to a postdoctoral fellowship at the University of California at Berkeley, planning an academic career.

Yet just as he had the right teachers and mentors at Lewis & Clark, Neff attracted some important attention at Stanford. "Out of the blue one day came something that really changed my life long term," he says. It was a call from Wolfgang Panofsky, an internationally renowned particle physicist and director of the Stanford Linear Accelerator. Panofsky (known as "Pief") was president-elect of the American Physical Society (APS) and was looking for an executive assistant. Would Neff take the job?

"I thought long and hard about that," Neff says. "It meant putting my physics career on hold. But it was really about the best thing that ever happened to me."

The "half-time" job thrust 29-year-old Tom Neff into the world of national science policy. "Pief didn't have time to be president-elect of the APS, let alone its president, so he would send me to his meetings," Neff says. "He was also an advisor to various parts of the government and a member of the Association of Presidents of Scientific Societies—where there were all these famous gray-beard guys—so I would go to those meetings for him too. I had to buy a suit for the first time, but I kept wearing my sandals."

In the course of his work with Panofsky, Neff helped draft the legislation that led to the creation of the Department of Energy. And when Panofsky launched the APS Panel on Public Affairs in 1974, Neff became its program coordinator. In 1975, he moved to the Center for Theoretical Physics at Massachusetts Institute of Technology, where he continued physics research and assisted the next two chairs of the APS panel, Philip Morse and Herman Feshbach. During this period, he also served as chief staff officer for the Ford Foundation's comprehensive Nuclear Energy Policy Study, which he later helped present to President Jimmy Carter and members of his cabinet.

In 1977, Neff was appointed director of MIT's International Energy Studies program, a position he held until 1985, when he became a senior member of the institute's Center for International Studies. Thus, when the time came to find a way to contain and destroy thousands of Soviet nuclear weapons, no one was better positioned to see the big picture than Tom Neff.

The deal wasn't a slam dunk. But Neff's Times op-ed, which he had circulated to key actors in advance of publication, got him an invitation to a nongovernmental bilateral meeting between American nuclear scientists and their Soviet counterparts. The Russians, led by Deputy Minister Mikhailov, were in Washington to discuss the technical details of implementing START 1— the historic July 1991 agreement to radically reduce the number of nuclear weapons deployed by the U.S. and Soviet Union.

The Soviet empire was financially ruined and on the brink of falling apart—mere weeks from its December 1991 demise— and the Russians were also in Washington looking for help.

Neff made sure he was in the right place to pitch his idea to the person who mattered. Following a short break in the talks, Neff noticed that Mikhailov had remained in the hallway with his interpreter—chain smoking. Seeing an opportunity to talk to the top Russian, Neff also stayed out of the meeting.

"I approached him in the hall to make my proposal, simply asking if he would be willing to sell fuel derived from [highly enriched uranium] in destroyed weapons to support his program," Neff writes in a draft of his book. "Mikhailov's response was that he was interested. I handed him a draft of the op-ed and the summary I had prepared, which Mikhailov folded and put into his suit coat pocket. As I turned to go, he suddenly asked a question through his interpreter: 'How much could I sell?' "

Neff had not anticipated this question—and he had no idea how much highly enriched uranium could be harvested from decommissioned Soviet weapons. "So I said 500 metric tons. Mikhailov thought for a minute and surprised me by saying he thought he could do that."

Earlier that day, Mikhailov had invited the American scientists to come to Moscow and Kiev in December for further talks, and Neff became part of that delegation. On October 24, his op-ed,

"A Grand Uranium Bargain," was published. He hoped the idea would take hold in Washington—"that someone in power would actually do something about it, the so-called decision makers," he says. "My great discovery was that that there aren't many real decision makers in Washington. But I had met a bunch of Russians. I had their business cards."

The idea was relatively easy to sell to the Russians, Neff says. In the confusion surrounding the collapse of the Soviet Union, a business deal made more sense than a treaty. Cash could accomplish more in the starving post-Soviet economy than could American diplomacy.

However, in the United States, many were still in a Cold War mindset, even as President George H.W. Bush was declaring that America had "won the Cold War." Regarding the Russian nukes, the State Department had a different view than the Energy Department, which had a different view than the National Security Council. And few in government, particularly Defense Secretary Dick Cheney, could imagine that the Russians could safely collect and dismantle their own weapons without U.S. assistance.

In the confusion surrounding the collapse of the Soviet Union, a business deal made more sense than a treaty.

Russia's minister of atomic energy, Aleksandr Rumyantsev (second from left), at a 2002 dinner for Thomas Neff (second from right). Rumyantsev and Neff worked together on the uranium purchase agreement.

"A lot of U.S. government and military people wanted to stick their noses in to tag, seal, and track everything," Neff says. "That wasn't possible. The Russians

were not going to let in a lot of 'spies' to play with their weapons. I figured they would find a way to keep them safe, just to harvest the reward of taking them apart and selling stuff off."

Trading megatons for megawatts was a way around the diplomatic and geopolitical impasse—but Neff had to make one final adjustment before his idea could get a fair hearing in Washington: He convinced the Russians to propose it. Once a concrete proposal came from the Russian side, the United States was compelled to respond and negotiate. An interagency group concluded that the deal had merit and, after some haggling over quantities and prices, an agreement to "recycle" 500 metric tons of weapons-grade uranium was signed in early 1993. The first shipment of fuel-grade uranium arrived in the United States in 1995.

With his scientific mind and the practical wisdom of his Oregon upbringing, Tom Neff saw an opportunity to propose and propel change. "I think there are always opportunities," he says. "There are always people who see something that can be fixed. The average college graduate will probably have an opportunity in his or her life to do something that actually improves things.

"But the trick," he says, "is recognizing it."

Thomas Lee Neff was born in 1943 in Oregon, the older of two boys; his family raised chickens and grew most of its own food. He studied math and physics at Lewis & Clark College in Portland, graduating with highest honors, and received his Ph.D. in physics from Stanford. As a senior M.I.T. researcher, he specialized in energy studies, writing books on nuclear power, solar energy and, in 1984, the global uranium market. His timing was propitious.

His son (and nephew of Thomas Lee Neff) -

https://www.colorado.edu/menv/people/jason-neff

"Jason Neff is an Associate Professor in the Environmental Studies program at CU Boulder where he also directs the undergraduate program in Environmental Studies. His research area is in biogeochemistry with a focus on a diverse array of subjects ranging from studies of the carbon cycle to atmospheric mineral aerosols. Through all these areas, Neff's primary interest is in how human activities influence the movement of nutrients and material through the Earth System and the impacts of changing biogeochemical cycles on both natural ecosystems and human society. He has served in a wide variety of roles at the University of Colorado and nationally and has authored over 80 scientific publications and a forthcoming introductory environmental science digital text titled 'A Changing Planet: the Science of Sustainability'. Neff speaks frequently to the media and public on the topic of land use change and dust storms in the deserts of the western US and has served on advisory panels for a wide variety of organizations including the US DOE, NASA, NSF, NCEAS, and other international science agencies. Professor Neff received his BA in Biology from The University of Colorado at Boulder (1993) and a Ph.D. in Biology from Stanford University (1999). "

- August 2005, Invited Talk, IAMAS, Bejing, Climate Variability and Change in the Polar Regions: Causality and Prediction: Decadal Trends and Variability over Antarctica: Linkages to Indian Ocean Warming? (with M . Hoerling)
- July 2001, Invited Talk: "The Northern Front Range Air Quality Experiment" in Exporting and Importing Air Polution: Local to Global Scales, MIT Energy Lab-Endicott House Summer Symposium, Denham MA.
- December 2000: Closing Address on the Future of Acoustic Remote Sensing at the Tenth Symposium on Acoustic Remote Sensing of the Oceans and Atmosopheres and Associated Techniques, Auckland New Zealand
- May 2000: Remote Sensing in the Polar Regions, NSF Workshop on Weather Forecasting in Antarctica, Byrd Polar Research Center, Columbus Ohio.
- January 1998 AMS Annual Meeting: Invited Joint Lecture Remote Sensing Technologies for Air Quality – and Associated Techniques, Short Courses on Applications of Mountain Meteorology and Air Pollution Meteorology; and

- January 1998 AMS Annual Meeting: Short-Course Luncheon Speaker on “Decadal Variability of the Tropospheric Circulation over Antarctica”

Research and Management Experience

- 1968-1970: Oceanographic and hydrographic surveys, Gulf of Alaska.
- 1971-Studies of acoustic scattering in real atmospheres and meteorological applications:
  - --Carried out first verification of turbulent backscattering theory for acoustic sounders.
  - --Identified excess attenuation effects on quantitative interpretation of sodar data.
  - --Verified effect of turbulence-induced beam-wander on sodar Doppler turbulence measurements.
- 1975-Present: Remote sensing of the Polar Regions:
  - --Developed and deployed first Doppler sodar in Antarctica, at South Pole Station.
    - --Carried out first numerical simulations and comparisons with sodar-derived wind and turbulence data obtained over a semi-infinite slope in the absence of a diurnal heating cycle.
  - --Initiated new program in Arctic boundary layer research using acoustic and radar remote sensing.
  - --PI:NSF/ Grant (1991-1995, OPP 91-18961) to observe and model transitory meso- and synoptic scale phenomena over the interior slopes of Antarctica using the first radar wind profiler on the continent of Antarctica.
  - --Published analysis of 40 years of data from the South Pole showing that ozone depletion has affected tropospheric weather processes over Antarctica, delaying the spring transition by one month.
- 1979-Present: Remote sensing of complex terrain flows:
  - --Introduced first Doppler sodars and lidar in the DOE ASCOT program.
- --Documented significant effect of marine air intrusions on drainage flow structure in the Coastal Mountains of California.
  - --Quantified internal wave contributions to measurements in EPA CTMD program.
- --Calculated with a 1-D numerical model, the effect of grid resolution on the prediction of radiative cooling of air over slopes and the generation of drainage winds.
- 1986-Present: Applications of remote sensing to air quality:
  - --Designed and directed the meteorological program for the 1987-1988 Denver Brown Cloud Study and the 1996-1997 Northern Front Range Air Quality Study.
  - --Initiated cooperative research program with the Colorado Department of Health for improvements in high pollution day forecasts and modeling of urban energy budgets.
  - --Used minisodars, for the first time, to detect shallow inversions in dense urban areas created by building shadows.
  - --Used sodars and Doppler lidars to verify the structure of shallow circulations produced by mesoscale lee troughs that in turn cause Denver's high pollution episodes.
  - --Developed and applied networks of 915-MHz profilers to mesoscale air quality transport problems including Grand Canyon Visibility, San Joaquin Valley and Southern California ozone episodes, and model validation for emergency response at the DOE Rocky Flats facility.
- 1988-1989: Deputy Chief, Atmospheric Studies Program Area
- 1989-1990: Acting Chief, Atmospheric Studies Program Area:
  - --Initiated program to develop integrated lower tropospheric profiling systems centered on the use of 915-MHz profilers.
- 1990-2001: Chief, Meteorological Applications and Assessment Division (later the Weather and Climate Applications Division)
  - --PI for several multi-year joint research projects with the State of California to study mesoscale pollution transport using 915-MHz radar wind profilers.
  - --PI:ONR Grant to study transitory coastal disturbances trapped by topography.
  - --Maintained strong polar research program in both the Arctic and Antarctic.
  - --Initiated new program for coastal weather research.
  - --Led the ETL contribution to development and renewals of the 915-MHz Cooperative Research and Development Agreement.
  - --Member of the Prospectus Development Team Number 2 of the US Weather Research Program
  - --Member of the Test and Evaluation Working Group of NAOS
  - --Initiated development program to deploy radar wind profilers on buoys and in highly cluttered environments.
  - --Developed, with CDC, a new program called the Climate-Weather Connection focused on the integrated use of observations, diagnosis, and prediction methods
  - --Published first paper documenting the effect of stratospheric ozone depletion on the seasonal cycle of tropospheric weather over the interior of Antarctic
- 2001-2005 Director, Environmental Technology Laboratory
  - --Restructured ETL to better financial management and to better meet NOAA programmatic needs.
  - --Provided stable boundary layer expertise to interpreting behavior of the surface chemistry over the interior of Antarctica (NSF: Antarctic Tropospheric Chemistry Investigation)
- 2005-2013 Director, Physical Sciences Division (PSD), NOAA Earth System Research Laboratory
  - --Created new laboratory from portions of ETL and the former Aeronomy Laboratory and the Climate Diagnostics Center based on previous initiative with CDC called the Weather-Climate Connection
  - --Carried out PSD’s first formal Laboratory Review (http://www.esrl.noaa.gov/research/review/2010/)

- --2006-present Initiated an ongoing session at the European Geosciences Union to bring together boundary layer physics and chemistry scientists in the polar regions
- 2014-present, CIRES Senior Research Scientist
  - --Published first paper using observations from Summit Station Greenland and the Twentieth Century Reanlysis to identify key processes responsible for the melting of the dry snow zone of Greenland in 2012 and 1889

Born

1942 (age 77–78)

San Mateo, California

Education

Dartmouth College, 1964 B.A.

Stanford Law School, 1967 L.L.B

William Horlick Neukom (born 1942) is an American former managing general partner of the San Francisco Giants baseball team ownership group. He held this position from May 2008 to December 31, 2011 and he was the managing partner when the Giants won the World Series in 2010, the first World Series win since the team had moved to California in 1958. Prior to holding this position, he was President of the American Bar Association in 2007–08.[1] He was the principal legal counsel for Microsoft for almost 25 years. He was also the Chairman of the law firm of Preston Gates & Ellis, LLP in Seattle, now part of K&L Gates. He is a member of the Board of Directors of the Pacific Council on International Policy[2] and spends the majority of his time focused on his role as Founder & CEO of the World Justice Project.[3]

Early life and education[edit]

Neukom was born in 1942, seven years before his brother, Daniel Neukom, who is a history teacher at Sacramento Country Day School.[4] He was raised in the Bay Area community of San Mateo, California. He was living in the Bay Area when the Giants moved to San Francisco in 1958. He graduated from San Mateo High School in 1960.

After receiving an undergraduate degree from **Dartmouth College** in 1964,[5] Neukom returned to the Bay Area where he received a law degree from Stanford Law School in 1967.[6]

Legal career and Microsoft[edit]

After completing his law degree, Neukom served as a clerk for Judge Theodore S. Turner of the King County Superior Court in Seattle in the years 1967–68.[7]

By 1977, he had joined the Seattle law firm Shidler, McBroom, Gates & Lucas (later Preston Gates & Ellis). Neukom's relationship with Microsoft began in 1978 when managing partner Bill Gates Sr. asked him to advise his son's fledgling software business.[5] Neukom started doing legal work for Microsoft when the company had just 12 employees. He would continue to be Microsoft's lead legal counsel for nearly 25 years.[8]

Neukom joined Microsoft as an employee in 1985 and thereafter built its corporate law department from an initial staff of five to more than 600 attorneys and support personnel.[9] He became an Executive Vice President at Microsoft. He spent 17 years as Microsoft's general counsel and chief legal officer, managing the company's legal, governmental affairs and philanthropic activities.[9]

Neukom during the 2010 Giants World Series victory parade, sporting trademark bow tie[10]

He was actively involved in legally defending Microsoft's intellectual property in several countries, most notably in Apple v. Microsoft.[7] He also was involved in defending Microsoft from a series of complex antitrust suits (i.e. United States v. Microsoft).[7] Neukom presided over Microsoft's defeat by the U.S. Department of Justice in a case that was referred to as the "trial of the century." [11] While at Microsoft, Neukom also directed the company's community affairs program, which initiated corporate giving programs including the Microsoft Giving Campaign, the Microsoft Matching Gifts Program, and the Microsoft Volunteer Program. In 2002 Neukom retired from Microsoft as Executive Vice President, Law & Corporate Affairs.[7]

After Microsoft, Neukom returned to Preston Gates & Ellis as a partner in the firm's business law practice.[9] In January 2004 he was named chair of that firm. **In 2007 Preston Gates & Ellis merged with Kirkpatrick and Lockhart of Pittsburgh to form the large law firm now named K&L Gates**.[9] Neukom no longer is affiliated with the firm.

Neukom served as president of the American Bar Association for a one-year term from August 2007 to August 2008.[12]

San Francisco Giants[edit]

Neukom had been an investor in the Giants since 1995 and on May 16, 2008 was named the new Managing General Partner for the Giants.[10] He succeeded Peter Magowan, who retired at the end of the 2008 season at the age of 66.[13] Neukom and other investors purchased a portion of Peter Magowan's ownership interest in the team. Neukom became the lead active investor of the team following the reduction of Magowan's ownership interest, the death of Harmon Burns (a leading investor who died in 2006) and the death of Sue Burns, who died in 2009.

On September 14, 2011, Bill Neukom announced he was retiring as the Managing General Partner and CEO of the San Francisco Giants effective January 1, 2012, and he would be succeeded by Giants executive Larry Baer.[14] The *San Jose Mercury* reported anonymous sources saying that Neukom was forced out due to differences in the ownership group on how to divide up the additional money earned after the Giants won the 2010 World Series.[15] The *Mercury* also reported Giants shareholder Charles Bartlett Johnson purchased additional interests in the team, becoming the largest individual shareholder at 25%.[16]

Philanthropic work[edit]

Between 1996 and 2007, Neukom was a member of the Board of Trustees of Dartmouth College, and he served as chair of the board from 2004 to 2007. Three of his children have attended Dartmouth. He is the founding donor of the Neukom Institute for Computational Science at Dartmouth College, which aims to advance computing resources and applications in multiple aspects of the Dartmouth curriculum.[9][17]

In 2006 Neukom committed to a gift of $20 million for the planned construction of a new academic building at Stanford University's law school.[6] The structure, named the William H. Neukom Building and opened in 2011, is 65,000 square feet (6,000 m^2) and is situated on the existing law school complex.[18]

World Justice Project[edit]

Neukom is the founder, president, and CEO of the World Justice Project, which works internationally to strengthen the rule of law, aiming to promote the development of communities of opportunity and equity.[12]

USS Neunzer (DE-150)

Wikipedia USS Neunzer (DE-150)

"USS *Neunzer* (DE-150) was an Edsall-class destroyer escort in service with the United States Navy from 1943 to 1947. After spending several decades in reserve, she was sold for scrap in 1973. " Wikipedia : (Sep 22 2019) : [HK001N][GDrive]

USS Neunzer History - from Wikipedia

Wikipedia : (Sep 22 2019) : [HK001N][GDrive]

Neunzer was named in honor of Machinist Weimar Edmund Neunzer, who was killed in action 2 July 1942 during the Aleutian Islands Campaign and was posthumously awarded the Air Medal. She was laid down by the Consolidated Steel Corp., Orange, Texas, 29 January 1943; launched 1 June 1943; sponsored by Mrs. Weimar E. Neunzer, widow of *Machinist Neunzer*; and commissioned 27 September 1943, Lt. John E. Greenbacker in command.

North Atlantic operations

Neunzer steamed to Galveston, Texas, and then to New Orleans, Louisiana, for fitting out. During October and November 1943 she went through shakedown off Bermuda. The new destroyer escort next visited Charleston, South Carolina, en route Quonset Point, Rhode Island. For 4 weeks she operated with an Atlantic Fleet research group, developing new equipment for antisubmarine warfare.

After escorting a group of troop transports from Boston, Massachusetts, to join a large convoy bound for England from New York City *Neunzer* proceeded to Norfolk, Virginia, joining TF 62 on 1 January 1944. With this group she escorted a large convoy to the Mediterranean, spending 8 days at Gibraltar before sailing for home.

Escorting Italian submarines

On her homeward voyage, she shepherded five Italian submarines to Bermuda for training purposes. During this trip, *Neunzer* carried out an operation which is believed to be unique for a destroyer escort. She refueled two Italian subs at sea, pumping 12,000 gallons of fuel through a fire plug and 200 feet of fire hose to the submarine.

In May 1944 Lt. Commander Virgil E. Gex became the skipper of the *Neunzer*. After two more voyages escorting convoys to the Mediterranean, *Neunzer* was detached from TF 62 to join escort aircraft carrier USS *Guadalcanal* (CVE-60) in a hunter-killer group. Following training at Casco Bay, Maine, and Bermuda, the task group made two search patrols for submarines in the Middle Atlantic, refueling in Bermuda. Neither of these patrols uncovered any submarines, and *Neunzer* returned to New York in late August.

During October the group put to sea again, this time searching for submarines in the North Atlantic. Although no submarines were discovered, the force ran through a very severe storm which damaged some of the ships. The patrol was finally broken off; the task group refueled at Ponta Delgada, Azores, before returning home early in November.

The antisubmarine group sailed from Norfolk 1 December for brief training in Bermuda en route Jacksonville, Florida, where for 5 weeks the carrier trained student pilots. The group proceeded to Guantanamo Bay, Cuba, late in January 1945 for 2 weeks of exercises; then *Neunzer* returned to New York for a brief overhaul.

After returning to Cuba for exercises in early March, the destroyer escort went to Miami, Florida, for 3 weeks as training ship for student officers of the Naval Training Center there.

But now the Germans were ready for their final push, sending their new snorkel-equipped subs across the Atlantic to attack the east coast. *Neunzer* suddenly received a message at midnight 8 April to get underway 6 hours later for Newfoundland. After refueling and provisioning in Argentia, she left on the 19th and rendezvoused in mid-ocean with one of several carrier task groups strung out across the Atlantic between St. John's, Newfoundland, and Fayal in the Azores as a net to trap the snorkels.

Battling German submarine U-546

USS *Frederick C. Davis* (DE-136) made contact with *U-546* on 24 April and was proceeding to attack when the submarine fired a stern shot which tore the DE apart and sent her down with heavy loss of life.

Eight destroyer escorts immediately joined the action. *Neunzer* and USS *Hayter* (DE-212) conducted a search while USS *Pillsbury* (DE-133) circled the area and USS *Flaherty* (DE-135) picked up survivors. *Flaherty* made contact in less than an hour and with *Pillsbury* proceeded to attack. The U-boat went to 600 feet. Contact was lost from 1045 until 1201 when USS *Varian* (DE-798), USS *Janssen* (DE-396), and USS *Hubbard* (DE-211) began another attack.

Neunzer got into the fight after several attacks by the other DE's, delivering a creeping attack with Varian and Hubbard while USS *Chatelain* (DE-149) directed. Contact was lost once more at about 1600, and *Chatelain* and *Neunzer* were ordered to return to the scouting line.

The line was expanded, and the ships began a sweep through the area, determined to prevent the submarine's escape. *Varian* made contact once more at 1731 and *Flaherty* was ordered to attack. She fired at 1810. Four minutes later a small oil slick began coming to the surface. *Flaherty* made another hedgehog attack at 1828, and at 1838 the U-boat broke surface.

Every ship in the line within range began firing. At 1844, after more than ten and a half hours of attacks, *U-546* rolled under for her last dive. Thirty-three of her crew, including the captain, were taken prisoner.

V-E Day

After V-E Day, *Neunzer* returned to New York for 2 weeks and left on 25 May to escort the last Atlantic convoy of World War II from New York to Southampton, England. She returned without a convoy, and remained in New York harbor from 15 June until 6 July.

In July the ship trained at Casco Bay, Maine, and served as target for the Motor Torpedo Boat Training Center, Melville, Rhode Island. On 1 August she sailed to New London, Connecticut, to escort *U-505*, captured by Guadalcanal's task group in June 1944. The sub was exhibited along the east coast and the Gulf Coast throughout the end of 1945 in a drive to sell War Bonds.

Post-War decommissioning

After operations along the Atlantic coast, *Neunzer* decommissioned in January 1947 and entered the Atlantic Reserve Fleet. Into 1970 she remained berthed at Philadelphia, Pennsylvania. On 1 July 1972 she was struck from the Navy list, and she was sold 1 November 1973, and scrapped.

Shipworkers Asked To 'Work Just Little Bit Harder' By Sullivans

ORANGE, April 27 (AP)—Mother and Father Sullivan, whose five sons were lost with the cruiser Juneau in Solomon islands action, urged Consolidated Steel corporation shipyard employes to "work just a little bit harder" when they spoke at launching of the destroyer escort vessel USS Neunzer, today.

Daughter Genevieve, now a WAVE, also spoke at the ceremonies.

The Neunzer was named for the late Machinist Weimar Edmund Neunzer and was sponsored by his widow, Mrs. Ruby Iris Neunzer of San Diego.

Christens Vessel

Mrs. Ruby Irish Neunzer (above) formerly Miss Ruby Blalock of Pensacola, widow of the late Machinist Weimar Edmund Neunzer, USN, had the honor of christening the escort vessel USS Neunzer, which was named in honor of her husband, termed one of America's naval flying heroes.

The vessel was recently launched at the yards of the Consolidated Steel corporation in Orange, Tex.

Neunzer, who was born in Lynn, Mass., was killed in July, 1942, while serving with a patrol squadron in the Aleutians campaign. He was awarded the Air Medal posthumously.

Second pilot in a patrol plane, Neunzer was cited for skillfully assisting in dive-bombing and straffing attacks against Jap ships in Kiska harbor despite severe Alaskan weather and low ceiling.

"Pulling out in the clear at a very low altitude," the citation read, "his plane was subjected to withering anti-aircraft fire from enemy ship and shore batteries and pierced by lighter calibre projectiles.

"By his courage and competent assistance in fulfilling a dangerous mission, he displayed fortitude and gallant devotion to duty."

Neunzer trained at the Pensacola Naval station in 1940. Mrs. Neunzer is residing at 417 Marine View drive, San Diego, Cal.

Military groups invading city

Albuquerque's a popular town for military groups. In September, 10 military conventions and reunions will take place here, each with 50 to 300 people, says the Albuquerque Convention and Visitors Bureau. The gatherings include:

- First Air Commando Association, ended Sunday.
- Field Station 8611, Sept. 6-10.
- USS Neunzer, Sept. 14-17.
- 460th Bomb Group Association, Sept. 21-23.
- Class of 1939-D Air Corps, Sept. 21-23.

Peril in the Atlantic: Author recalls WWII battle

Daily News Photo by Jeffrey Langlois

Richard Snow, author of 'A Measureless Peril: America in the Fight for the Atlantic — The Longest Battle of WWII,' talked Tuesday about his father's fight with a German submarine.

By MICHELE DARGAN
Daily News Staff Writer

'Longest battle' killed 80,000 people, Richard Snow tells Prologue Society.

Richard Snow remembers his mother telling the superintendent of their apartment building that she was "so grateful" her husband didn't see active duty in World War II.

Snow's father reminded his mother that he was involved in battle while serving as a lieutenant on the USS Neunzer. The Neunzer chased down and helped sink the German submarine that had destroyed the Neunzer's sister ship.

"My mother knew perfectly well my father had been in a fight with a submarine," Snow said. "And yet her comment wasn't ludicrous. And that's because the kind of battle ... it was the battle of the Atlantic ... the longest battle of World War II, killed 80,000 people ... and yet it's not remembered as much as it should be because it didn't take the form of a proper naval battle."

Snow, author of *A Measureless Peril: America in the Fight for the Atlantic — The Longest Battle of WWII,* spoke Tuesday to the Palm Beach Prologue Society at Northern Trust Bank.

Prologue Society chairman Nicholas Pollard, a native of Great Britain, introduced Snow.

"As a British national, I fully understand the sacrifices that were made by countless thousands who helped keep the British Isles figuratively and literally afloat during the darkest hours of the second World War, many of whom made the ultimate sacrifice," said Pollard, a vice president at Northern Trust. "And I would be remiss if I didn't pay homage to those who sacrificed so much for me and my country. It is a debt that can never be repaid, but thank you."

Snow said he almost titled the book The Forgotten War.

"But that seemed a little

hokey and not quite right for the only action in World War II where tens of thousands of civilians saw the fighting going on," he said.

The war in the Atlantic during World War II was measureless — not only because U-boats were hard to spot and harder to sink — but also because it was impossible to tell who was winning, Snow said.

Snow, the former editor of *American Heritage Magazine*, became interested in this aspect of World War II through the letters his father, Richard B. Snow, wrote to his mother, Emma Snow.

As the author told the Prologue Society, his father was a successful architect when the war broke out and was serving the Navy stateside at an office in New York.

But his father hated the fact that as he walked back and forth to work wearing his Navy uniform, he received salutes from men who had come back from battle.

One night, he came home from work and told his wife he wanted to go to serve his country at sea.

Emma Snow agreed on the condition that he write her every day.

Richard Snow said he always knew the letters were around, but put off reading them. Once he did, Snow became fascinated by the letters.

One talks about the boredom of convoy duty.

"It is so terribly tiresome to be out of sight of land for weeks at a time," he wrote. "The only thing a beautiful sunrise reveals on the ocean is a few whitecaps, a bit of kelp or a porpoise or two."

[HB002N][GDrive]

From the book - this is just one section. Lots of history about the Neunzer in here.

"Set the Watch"

The birth of a warship, 1943

t ' k ' k

Most destroyer escorts were namedfor menwho hadalready died in the war the ships were goingto help fight.

Machinist Weimar Edmund Neunzer was killed in July 1942 while dive-bombing a Japanese submarine. The ship that would carry his name was built by Consolidated - my father saw it taking shape while he was trying to get to sea - and on April 27, 1943, Ruby Iris Neunzer, the flier's widow, broke a champagne bottle against the newborn's bow. The Neunzer slid backward into the Sabine River and bobbed and steadied, riding very high in the water because she was still just a hull, not yet both a working town and an engine of destruction. Accomplishing that meant not only adding the guns, but typewriters, filing cabinets, staplers and mimeograph machines, radios and anchor chains and blowers, soup pots and soup bowls, fire hoses and life jackets, signal flags and elegant, hand-wound chronometers that kept time at sea just as their forebears had when our new heavy frigates were alarming Englandin theWar of 1812.

The start of this familiar process on DE 150 would have had no special significance for my father, but then his superior, who liked him, hinted he might be assigned to the Neunzer. The moment it happened, he was sent up to firefighting school in Norfolk, Virginia. This was a serious and spectacular course: "Today we put out great big oil and gasoline fires and got hot wet and dirty during it. The instructors are fine, all experienced firemen from various big metropolitan fire departments, and they are eager to help and advise."

Then he brought his singed eyebrows to New York for three weeks' leave with my mother - Oklahoma!was a particularly bright moment of

it - before heading back to Orange, where he found the Neunzer the brief center of attention in that whole great forcing-bed of warships. She was still enmeshed, as she had been for months, in hoses and cables, but the tempo of the work had increased and engineers and officers with clipboards and flashlights moved among the welders andpainters.

On September 26, my father wrote, "Our crew arrived today and we were busy all day loading the ship. I have a very young skipper, Lt. Greenbacker, U.S.N., and I amvery nervous about satisfying him."And everything else, too: "I am nervous as a cat about the way things are going to go. There is so much that only experience afloat can teach me, andI amshy onthat."

Sowere most of his shipmates. Of the 209 officers and men who had just arrived aboard, perhaps 30 had seen sea duty. John Greenbacker most definitely had.The son of aConnecticut dairy farmer, he had been so eager to join the navy that as early asjunior high school his friends were calling himAnnapolis. He got to the academy in 1936 and, assoon as he graduated, was posted to the carrier Yorktown. The ship ran convoys in the Atlantic before Pearl Harbor, then went to the Pacific and the Battle of the Coral Sea, where a near miss ruptured a fuel tank, and to Midway,where Japanese torpedo planes sank her.

Greenbacker, one of the last men off, was ordered to the new subchasing school in Miami and eventually transferred to the Stewart, becoming executive officer of the first destroyer escort built by Brown Brothers of Houston. Brown Brothers was a good example of the pressure of war measures at the time: before the company bid its way into the DE program, the closest it had come to building a ship was winning the contract to put the concrete capping on the locks of the Panama Canal. The neophyte builders took a while to get the hang of it.

"I went to Houston," said Greenbacker, "and got there in February of 1943 and the ship didn't go into commission until something like the first of June." After a Shakedown cruise, he was ordered back to Texas, this time to Orange, to take over another brand-new DE. Consolidated made a faster job of finishing its ship than its Houston rivals had theirs:

"I was only there for four weeks beforewewent in commission."

By the early afternoon of Monday,September 27, 1943,the last of the hoses and welders and men with clipboards had left the ship. A theaterful of folding chairs hadsprouted on the dock by her stern. They were occupied largely by friends and family of the crew, and by a band.

Behindthe chairs stood the workers who hadput the ship together. The crewwas gathered onher fantail, andher officers stood at attentionby a podium set up there. The band played in the cool September sunshine, and my father was surprised to realize that he would miss Orange - or, he hastily modified this extravagant reaction, the friends he had made working on the shore detail there. A little after two o'clock the band subsided. A Consolidated official approached the podium and turned over the ship to the US. navy in the form of Captain J. M. Schelling, USN, representing the commandant, Eighth Naval District. Captain Schelling read aloud the orders authorizing himto accept i t , did so, and said, "Hoist the colors."

At the how the UnionJack blossomed - white stars, navy blue fieldwhile aft a sailor ran the American flag up the staff. Amidships, the commissioning pennant, a long ribbon with one red stripe, one white one, and a narrow blue field with seven bars, broke from the mast. In that moment the Neunzer became the USSNeunzer. Captain Schelling turned her over to Captain Greenbacker, who gave his first order as commanding officer: "Set the watch."

"Set all regular port watches," begins the DE 150's log, which would be kept hour by hour, day by day, all the years she was in commission.

But even before that the first entry reads, "The following men were received on board for duty (see attached list)." The roster of those who were to give a soul to the machinery begins, "ADAMOVICH, John 646 40 49 [the serial number of the "name, rank, and serial number" that is all the information you're supposed to give your captors], USNR; ADAMS, Trenouth A., 875 49 20, FC3c, USNR"; and right on through two hundred names until "WHITMAN, Arthur R., 245 03 59 Szc, USNR; WINIEWSKI, Louis E, 224 10 80, SF2c, USN [a valuable man: that USNasopposed to USNRmeans he is regular navy, not just called up aspart of the naval reserve; so is his successor]; ZONFRELLO, Peter, 376 58 15, 82c, USN."

The logmakes the next day sound awfully quiet, although it hadto be one of constant tumult as people were set to newjobs and put into new accommodations. But the whole entry, under the frowning "CONFIDENTIAL" that will head every page for the rest of the war, begins, "0000 - 0400. Moored stbd side to dock at City Docks, Orange."

At four-hour intervals this is followed by the stolid phrase "Moored as before." It concludes with the final watch report of the twenty-four-hour day: "2000 -

2400. Moored asbefore." This is signed bymyfather, and it is a thrilling surprise for me to see his handwriting, which would change not a bit for the rest of his life, fresh, black, immediate, put down there on his spanking new ship, with the familiar glare and clamor of all-night Orange already part of another existence. He had a sense of the occasion. In the months ahead he would sign all the hundreds of logentries he made "R.B. Snow Lt USNR." But for this, the last watch of the ship's first full day in commission, he is "Richard BoringSnow Lieutenant USNR."

Everyone from Adamovich to Zonfrello was busy the next day asthe ship absorbed all the proteins of war. The log's sparse report says, "0822 commenced loading ammunition; 0947 commenced fueling ship."

With the ammunition they would likely have started with the 20mm rounds,which came in olive-colored magazines.Once they were stowed, sailors carried aboard shells for the three-inch guns, each man cradling a single tall, brass-jacketed cartridge while constantly being instructed to "keep those noses up now, goddamn it." Whenthe ready ammunition had been housed near the guns, the rest came aboard in wooden crates, the 20mm magazines in square boxes, the three - inch rounds in long, coffin-like ones.

The job took a little less than three hours. Meanwhile a thick black hose came aboard and the DEsucked in diesel oil, eighty-two thousand gallons of it in four hours.

Then came the first of what would be many hundreds of generalquarters drills: the alarm agitating in shrill bursts, sailors punching their arms into life jackets, running past each other to their battle stations, putting on helmets, while, on the bridge, the telephone talker relayed reports from the stations - "Condition Able set forward. Depth charge manned and ready. Engine room manned and ready" - until the ship abruptly fell silent, and the perpetual noise of the Consolidated yard insinuated itself again, and the talker said, "All stations manned and ready."

The ship secured from the drill forty-five minutes later and hurried on toward another milestone. "Made all preparations for getting underway," the log records.

"Now go to your stations, all the special sea details." This was a bosun's mate, over the ship's loudspeakers. Once again men swarmed the decks; once again, the bridge talker passed along reports. "Fo'c'sle manned and ready, sir. Fantail manned and ready. Engineering spaces manned and ready." When everything was manned and ready, Captain Greenbacker gave the order: "Single up your lines."

Twelve paired lines held the ship to six bollards along the dock.

Consolidated-yardmenthrew offone from each mooringpost. "All lines singled up, sir," said the bridge talker. Greenbacker spoke again, the remaining lines fell from the dock into the Sabine to be quickly pulled aboard, and the log reported, with "Captain conning and Navigator on the bridge," as the Neunzer moved out from the dock.

It wasn't much of a voyage, just a few hundred yards to tie up alongside another DE, the Peterson, still at the capacious City Docks, but the ship had been under her own power and worked by her own crew.

Nobody spent any time celebrating the maneuver. My father went back to his endless tasks. On the twenty-ninth he spoke of the routine in the first letter my mother received whose envelope carried the return address "USS Neunzer (DE 150) Fleet Postmaster NY." It was also the first to bear the rubber-stamped passed bynaval censor circling the initials of the censoring officer.*

His inaugural shipboard letter was brief and far from happy.

"Another very busy day! Not as much accomplished on the ship as I should have liked but will have a crack at it tomorrow. My gear is all crammed into various drawers in an ungodly fashion. When the ship gets straightened out I hope to do likewise but I'm afraid it will be not until!

"What astupid letter. I guess I AM tired."

A few days later he was just as busy, but more cheerful about it: "There must be something very dire impending - because it isn't normal for me to have twenty minutes to myself - Ever since I talked with you on the phone from Orange we have been on the run - myself perhaps more than some of the others, for there have been so many small hull items to design, rip out, or finish up which involved telling somebody how long or how wide at all hours of the day and night. I have a splendid chief boatswain mate who runs things admirably from the seamanship point of view and of course I'd be making a monkey out of myself without someone like that to help out. Among other pedestrian jobs which have fallen to my lot is that of sorting and distributing about 500 keys, something that would try the patience of the most hardened shipping clerk. Other items which weigh very heavily on me are a leaky toilet, a leaky steam valve, more shelving, less heat etc. etc. So you can see the life of a First Lieutenant is in some respects not very different from that of an architect. However - a watch on the flying bridge is another story. Our executive officer is an ideal person to have charge of the shaping up of such a motley crew of officers and men as are in his charge - patient, experienced and tactful. I feel be fully appreciates whatever capabilities his officers already have and is very willing to work to develop those which come only with experience."

This exemplary officer was Virgil Gex, andmy father's regard for him did not wane during the war, or for the rest of his life. The son of a Missouri farmer, Gex was appointed to the NavalAcademy, but a failed eye exam put him into the Naval Reserve. He took ajob at Procter and Gamble, but by December 1940 the increasingly hard-pressed navy decided his eyesight wasn't sobad after all, andhe was sent asan ensign to the four-stacker Chew. December 7, 1941, found the Chew in Pearl Harbor moored four hundred yards away from the Arizona. Gex saw

the bomb that exploded the battleship's magazine pierce her deck. The Japanese aim was all too good, and they weren't interested in World War I destroyers, so the Chew survived to operate out of Pearl for the rest of the war. Virgil Gex, risen to a gunnery and senior watch officer, was detached in May1943to help puttheNeunzerin commission.

"Our Captain and Executive Officer beingboth absolutely of the first rank in experience and ability (althoughboth are only slightly too old to be my nephews!) the ship's organization should develop very satisfactorily."

Quickly, too, because when my father wasn't occupied with the familiar tasks of formulating measurements and attending to plumbing, he found himself put into the swim of naval life with unusual speed.

Reminiscing years later, Captain Greenbacker said he and Lieutenant Gex "and, I think, the chief engineer, were the only [officers] that had ever been to sea at all. I knew that in some of these cases the captain and the exec would stand off-and-on watches" - that is,one relievingthe other in four - hour rotation. "I didn't do that. I said, 'You get on out there, you be officer of the deck. Call me if there are any questions. Call meif you sight anything."

It was a new world, and not a simple one to my father. "The ship organization is hardly less complicated than the social structure of India, and castes among

the petty officers must be as strictly observed.

Any deviation from the proper chain of authority causes ripples which eventually rock the whole ship - and it is of great importance to learn the proper channels of activity assoon aspossible."

A couple of weeks later, in aletter hehopedwas "not too expository," he gave his wife an admirably clear account of shipboard routine. "We have had a good deal of steaming since I last wrote you, and all of us have had to stand deck watches night and day, as our turn comes up.

The officers are divided up into groups of two, an Officer of the Deck and a Junior Officer of the Deck, and watches are usually four hours, during which the normaloperation of the ship is in charge of the GOD.

The Captain and the Executive Officer come to the bridge from time to time and are always there in any unusual situation, but in normal steaming the COD has charge of the handling of the ship and her routine. Of course this is intensely interesting - always a grave responsibility and a job in which experience counts for almost everything, andwith the constantly recurring watches, experience is the one thing of which there is plenty to be had. Off watch all the officers are busy with organizational and administrative affairs. My departments are Construction 8:Repair (C&R) and damage control, and I am Division Officer of the First Division - in general the Deck ratings forward. What a lot of detail there is to be straightened out in all that! I am fortunate in having a seasoned and very able Chief Boatswain's Mate, who has the happy faculty of instructing me under the guise of conferring with me. He has never even so much as hinted that he has forgotten more seamanship than I've ever known, which I think indicates great good feeling, and is probably more than I could manage under reversed circumstances. He is well satisfied with the assortment of green but willing seamen under his charge - and the boys are all coming along extremely well in their line handling, and chores about the ship."

He concluded, "Good night, my dearest - I love you and think of you 'at all times' - which is the Navyway of saying 'Always.'"

Despite this authoritative summary, hewrote afew days later, "Time certainly rolls along - but I don't feel my age as I should. Just when I might begin to feel a certain degree of achievement and settledness (no such word I presume) I wander into an entirely newtrade, start in at the bottom of the ladder in competence, if not in rank, and spend my waking hours (and they are many) with youths in their early twenties.

However, any doubts I may have held as to whether I am growing old were dispelled by a glimpse of the commissioning picture of the USS Neunzer, in which I look like a not too able character actor of 50, surrounded by ruddy and unlined adolescents not yet approaching the prime of life."

Still, there were compensations: "I have a very snug little cabin forward of the wardroom. My cabin mate is a very long and attractive young man, who has to fold up like a jackknife to get in the upper bunk, but as he is junior to me, that's where he goes (the advantage of my great age)."

My father had finally got his belongings - shirts, shoes-"put away in a magnificently orderly fashion." He was in good company: "Mr. Gex is extremely attractive and so are the other officers. I don't know whether it is just because they are my shipmates or whether they actually are as a group superior to some of the others I've seen. In any case, they all seem 0.81. to me." And "our food continues to be excellent and plentiful."

The food was good. The first supplies to come aboard the freshly commissioned Neunzer - before ammunition, before fuel - were, the log records, 210 pounds of bread "received from the Fehr Baking Co inspected asto quantity by RM.Turner, Jr. , Lieut, and asto quality by Y.R. Tate, PhM 1/c [pharmacist's mate first class]." Three hours later Turner and Tate were called upon to inspect "8 gal ice cream from Stewart Dairy Co." The navy had long had the reputation of being the best-fed service, and meals improvedthroughout the war.

The 1940 edition of The Cook Book of the United States Navy is a skinny 164 pages. Although it reflects a diet far better than many Americans were enjoying in the final years of the Great Depression, the recipes - "ALL FOR 100 MEN" - are workmanlike to the point of drabness: "Cut 60 pounds of mutton into 5-pound pieces and wipe with a clean damp cloth. Place in boiling water and boil for five minutes.

Then reduce to a simmering temperature and let cook until tender.

When about halfdone season with salt." In fairness to the Supply Corps officers who assembled the book, the result should be "serve[d] with caper sauce," but this is also pretty rudimentary: "2 pounds flour. 3 pounds chopped pickles or capers. 2 pounds butter or shortening. Salt and pepper to taste." Manyof the recipes are even less inspiring - "Lima Bean Loaf - and some are actually dire: "Canned Creamed Codfish" (which employs the only fish mentioned by name other than "Canned Salmon"; the rest of the piscine world is covered by the twin entries "Baked Fish" and "Fried Fish"). One of the seven sandwiches recommended is this imaginative confection: "Put between these slices [ofbread] three slices of crisp lettuce leaves."

The Cook Book of 1944 has grown to 430 pages, nine of them devoted to dozens of sandwiches. The lettuce filling has been augmented with tomatoes and bacon; the mutton recipe has disappeared. There are fifty pages of desserts. Fish are cited by species:

"Fillet of Flounder," "Baked Halibut and Tomatoes." The creamed codfish remains among the manifold hardships of war, but a typical "winter menu" runs:

- Navy Bean Soup
- Fried Pork Chop Gravy
- Hominy Spoonbread
- Buttered Green Peas
- Apple Cole SlawSalad
- LemonCream LayerCake
- BreadButter Coffee

Among the Neunzer's crew were hill-country boys who had got the worst of the Depression since they had been three or four years old. My father rememberedthem ballooning under the impact of their new diet, giving the ship a population of fat men for a few weeks until their young metabolisms caught up.

A month after Consolidated turned the Neunzer over to the navy, Lieutenant Snow described a scene in which food and shipmates and growing competence had combined to produce, for the moment at least, an obviously contented man: "Last night I had the mid watch with Lt. Gear - midnight to 4AM - or 0000 - 0400 in navy figures It was a long watch, but uneventful, and we stood all the way topside on the ship under the stars. It was most impressive to look back occasionally and see the tall mast swaying back and forth against the dark star-lighted sky. When I came down offwatch I found the steward had left steak and potatoes in the pantry oven, sol hadavery early breakfast before I went to bed for two or three hours sleep."

The Heartbeatof the Pings : The importance of sonar, 1941 - 45

The Neunzer's sea career had begun on October 1, when she left the Orange City Docks, bound for Galveston: down the Sabine River, past Port Arthur, shimmering in the perpetual stink of its oil refineries, and out into the Gulf of Mexico, where for the first time the ocean swell lifted the new ship. The sea was not running high that day, but those who were going to get seasick began to. My father could report with satisfaction to my mother, "It appears that whatever other limitations I may have to contend with (and they are legion) sea sickness will probably not beone of them."

The men went to general quarters, and for two hours the ship steamed through a racket of its own making as all the guns were tested and the torpedo tubes swiveled this way and that. By late afternoon the DE was moored at Galveston, and the next day she ventured into the mawof the Todd construction company's Floating Drydock 3, a topless, steel shoebox hundreds of feet long and halffull of water. The Neunzer inched in amid an ecstasy of shouted instructions and orders between dock and ship. Tall steel gates closed behind her stem, and pumps began to empty the dock, gentling the ship down to rest on keel blocks and cradles. In less than half an hour the Neunzer was standing like a model on a mantelpiece.

For two days it was like Orange again, with workers everywhere and the ship drawing its power and water from shore while final adjustments were made and weaknesses disclosed by the brief voyage set aright. Then the DE was refloated and put to sea, bound for Bermuda andher Shakedown cruise.

At 2 2 0 2 on October 15, with supper already hours in the past and taps just sounded, the sonar man made a sound contact.

The navy had been trying to listen for submarines underwater since World War I, when operators strained to make sense of the noises picked up by an "S.C. [sub-chaser] tube," which was more advanced than atin-can-and - string telephone, but not by much. Betweenthe wars the British and American navies developed what they called asdic and we called sonar (for "sound navigation and ranging"). This could passively listen for engine noises, but it also had the capacity to hunt a submarine by emitting a sharp ping from a retractable dome in the ship's hull. If this pulse of noise hit an object, it would bounce back an echo, which the gear amplified and transmitted to the sound shack up near the bridge. The man listening to the echo could tell from its pitch where and how far away the object was. That is, he could tell if he had an exceptional ear and alot of training.

By the late 19305 our old four-stackers were being fitted with sonar, and two schools had been established to train operators. The first students helped develop the technique even as they learned it:

"Everybody in antisubmarine warfare at that time was an inventor," one of them remembered happily. This was surely what my father was referring to when, during his training days in Florida, he had written my mother cryptically, "In one of the courses my accurate sense of relative pitch (not to be confused with my intonation when performing on the violin) is going to be a great help. Isn't that a surprise!"

The electronic chirp became as much a shipboard constant as the engines or the sea itself. Wirt Williams, who served in the North Atlantic aboard a four-stacker and wrote a novel about it called The Enemy, remembered, "Each ping was like the sound a rock makes dropped into a lake, silvery, searching, and finally vanishing but never dying. The pings were seconds apart, like a dead-slow heartbeat. They were our eyes, and ears, and nose, under the sea." To Williams, the sonar was the most important piece of equipment on his destroyer:

"The heartbeat of the pings was her reason for existence. When they stopped, she was nothing."

Now the pings had told the Neunzer, on her nineteenth day in commission, that a submarine might be out ahead of her under the night waters. The alarm began its clamor and sailors rushed to their stations.

When hewas still outfitting destroyer escorts my father had written his wife that "the DEwhichjust left hadonboardtwo of the tiniest most appealing little kittensyou ever saw. They were not fluffy ones, but thin wistful little things with large ears and beautiful ascetic faces - they are very tiny, and very calm, don't scamper about, but walk around deliberately or lie in what shade they can find. There was something delicious in seeing one of them carefully select the shade of a 300 lb. cylinder of TNT to lie down for a little rest. Somehow the kitten looked normal and made all the rest of the show look alittle absurd - but don't say I said it."

I'll bet the cylinder of TNT didn't look absurd to him that night. The kitten had been taking its ease beneath the DES main antisubmarine weapon, the depth charge. A sailor would have referred to it asan ash can, and compared with other fixtures on the ship - the sonar, for instance - it was asprimitive asthe nickname makes it sound. For the first years of the war our ships had been outfitted with the Mark 6, which, unlike the sound gear, had changed scarcely at all since Armistice Day 1918. Rolled off racks at the stern of the ship, or shot out from its sides with K-guns, it would tumble down to a preset depth, where water pressure ignited it.

If simple, the weapon was far from feeble. E. J. Jernigan had received a vivid demonstration of its potency while he was still aboard his new battleship Washington in the North Atlantic. His ship was sailing through heavy fog in company with four British destroyers some two hundred yards astem of the battleship King George V. One of the destroyers blundered across the bows of the George V and, said Jemigan, "the huge battleship cut her completely in two." As the Washington steamed between the two halves, the destroyer's depth charges began to explode. Their effect on the accidental and un-submerged target - one of the largest and heaviest warships afloat was that "all 1900 tons of the number 2 turret jumped the track. The range finder went out and two-thirds of all the light bulbs were broken.

The after-steering engine room crew was so badly shaken that they got out in a hurry thinking we had been torpedoed. The screws came out of the water while exploding depth charges drove us high in the air.

We finally began to settle by the stem and felt like we were falling. The screws ran away until they bit into the water again."

By the time the Neunzer put to sea the Mark 6 depth charge had been replaced by the Mark 9, which was streamlined (i t looked like the atomic bomb envisioned by newspaper cartoonists in the 19503), sank faster than its predecessor, and ignited with a far greater concussion.

The Mark 9 was said to be lethal to a submarine if it exploded within thirty feet, but nobody knew this for sure, and there were other problems.Throughout the war, sonar could tell where asubmarine bore on the pursuing ship, but not how deep it lay, so setting the proper depth on a charge was largely a matter of instinct; sonar lost contact when it got within 150 feet of its target; and when the charge burst, it deafened the equipment for long enough to allow a good U-boat commander - and they were all good - to pivot and sneak off in another direction while the shattered water gave the listeners only scuffling, sterile noise.

So the Neunzer went into its first attack with hedgehogs. As the homey descriptive name might suggest, the British had developed this weapon, an odd,

busy-looking machine. Wenty-four steel “spigots” reached up from the cradle in which it was mounted, each one topped with a projectile that carried thirty pounds of explosive. That was a tenth asmuch asa depth charge packed, but still enough to crack open a submarine with a direct hit. Contact-fused, unlike the depth charge, it would explode only if there was a direct hit. Because of this, and because the bombs fired forward, throwing their projectiles in a semicircle 250 yards ahead of the ship, sonarmen could keep contact with the target while it was under attack.

The Neunzer had all her battle stations manned and ready eight minutes after the alarm and began her first run. The hedgehog projectiles went off in pairs, quickly, throwing a lariat of twenty-four splashes. That was all they accomplished. The contact remained strong.

Another twenty-four rounds went out into the dark. They, too, failed to disturb whatever they were fired at, and the Neunzer made one more unrewardedhedgehogrunfour minutes later.

Captain Greenbacker decided to shift to the depth charges and dropped eight of them. The sea bulged and then broke into hundredfoot- tal] spars of foam behindthe ship. The contact disappeared but, the log says, "with no evidence of damage to target.”

Sonar was a highly exacting discipline. The Neunzer could have been attacking a shoal of fish, or a stream of colder water flowing beneath the surface, or any number of the other bounteous distractions the ocean had to offer (among them “snapping shrimp,” whose conversations produced a noise that could confound the inexperienced operator).

“There was a lot of activity with whales,” Greenbacker said of those early days aboard. “The whales took alot of beating, I’msure.”

The Neunzer secured from general quarters half an hour after midnight and steamed on, if unvictorious also unharmed, to learn its business in Bermuda waters.

https://en.wikipedia.org/wiki/Nipah_virus

Virus classification

- (unranked): Virus
- Realm: Riboviria
- Kingdom: Orthornavirae
- Phylum: Negarnaviricota
- Class: Monjiviricetes
- Order: Mononegavirales
- Family: Paramyxoviridae
- Genus: Henipavirus
- Species: Nipah henipavirus

Nipah virus, scientific name Nipah henipavirus, is a bat-borne virus that causes Nipah virus infection in humans and other animals, a disease with a high mortality rate. Numerous disease outbreaks caused by Nipah virus have occurred in South and Southeast Asia. Nipah virus belongs to the genus Henipavirus along with the Hendra virus, which has also caused disease outbreaks.

[..]

Virology

Like other henipaviruses, the Nipah virus genome is a single (nonsegmented) negative-sense, single-stranded RNA of over 18 kb, which is substantially longer than that of other paramyxoviruses.[1][2] The enveloped virus particles are variable in shape, and can be filamentous or spherical; they contain a helical nucleocapsid.[1] Six structural proteins are generated: N (nucleocapsid), P (phosphoprotein), M (matrix), F (fusion), G (glycoprotein) and L (RNA polymerase). The P open reading frame also encodes three nonstructural proteins, C, V and W. There are two envelope glycoproteins. The G glycoprotein assembles as a tetramer to form the viral anti-receptor or attachment protein, which binds to the receptor on the host cell. The F glycoprotein forms a trimer, which mediates membrane fusion.[1][2]

Tropism

Ephrins B2 and B3 have been identified as the main receptors for Nipah virus.[1][2][3] Ephrin subtypes have a complex distribution of expression throughout the body, where the B3 is noted to have particularly high expression in some forebrain subregions.[4]

Evolution

The most likely origin of this virus was in 1947 (95% credible interval: 1888–1988).[5] There are two clades of this virus—one with its origin in 1995 (95% credible interval: 1985–2002) and a second with its origin in 1985 (95% credible interval: 1971–1996). The mutation rate was estimated to be 6.5×10^{-4} substitution/site/year (95% credible interval: 2.3×10^{-4} –1.18×10^{-3}), similar to other RNA viruses.

Pteropus vampyrus (large flying fox), one of the natural reservoirs of Nipah virus

Geographic distribution

Nipah virus has been isolated from Lyle's flying fox (Pteropus lylei) in Cambodia[6] and viral RNA found in urine and saliva from P. lylei and Horsfield's roundleaf bat (Hipposideros larvatus) in Thailand.[7] Infective virus has also been isolated from environmental samples of bat urine and partially eaten fruit

in Malaysia.[8] Antibodies to henipaviruses have also been found in fruit bats in Madagascar (Pteropus rufus, Eidolon dupreanum)[9] and Ghana (Eidolon helvum)[10] indicating a wide geographic distribution of the viruses. No infection of humans or other species have been observed in Cambodia, Thailand or Africa as of May 2018.

History : Emergence

The first cases of Nipah virus infection were identified in 1998, when an outbreak of neurological and respiratory disease on pig farms in peninsular Malaysia caused 265 human cases, with 105 deaths.[11][12][13] The virus itself was isolated the following year in 1999.[14] This outbreak resulted in the culling of one million pigs. In Singapore, 11 cases, including one death, occurred in abattoir workers exposed to pigs imported from the affected Malaysian farms. The Nipah virus has been classified by the Centers for Disease Control and Prevention as a Category C agent.[15] The name "Nipah" refers to the place, Sungai Nipah in Port Dickson, Negeri Sembilan, the source of the human case from which Nipah virus was first isolated.[16][17] Nipah virus is one of several viruses identified by WHO as a likely cause of a future epidemic in a new plan developed after the Ebola epidemic for urgent research and development before and during an epidemic toward new diagnostic tests, vaccines and medicines.[18][19]

The outbreak was originally mistaken for Japanese encephalitis, but physicians in the area noted that persons who had been vaccinated against Japanese encephalitis were not protected in the epidemic, and the number of cases among adults was unusual.[20] Although these observations were recorded in the first month of the outbreak, the Ministry of Health failed to take them into account, and launched a nationwide campaign to educate people on the dangers of Japanese encephalitis and its vector, Culex mosquitoes.

Symptoms of infection from the Malaysian outbreak were primarily encephalitic in humans and respiratory in pigs. Later outbreaks have caused respiratory illness in humans, increasing the likelihood of human-to-human transmission and indicating the existence of more dangerous strains of the virus.

Based on seroprevalence data and virus isolations, the primary reservoir for Nipah virus was identified as Pteropid fruit bats, including Pteropus vampyrus (large flying fox), and Pteropus hypomelanus (small flying fox), both found in Malaysia.

Locations of henipavirus outbreaks (red stars–Hendra virus; blue stars–Nipah virus) and distribution of henipavirus flying fox reservoirs (red shading–Hendra virus; blue shading–Nipah virus)

The transmission of Nipah virus from flying foxes to pigs is thought to be due to an increasing overlap between bat habitats and piggeries in peninsular Malaysia. At the index farm, fruit orchards were in close proximity to the piggery, allowing the spillage of urine, faeces and partially eaten fruit onto the pigs.[21] Retrospective studies demonstrate that viral spillover into pigs may have been occurring, undetected, in Malaysia since 1996.[11] During 1998, viral spread was aided by the transfer of infected pigs to other farms, where new outbreaks occurred.

History : Outbreaks of disease

Main article: Nipah virus infection (includes list of outbreaks)

Nipah virus infection outbreaks have been reported in Malaysia, Singapore, Bangladesh and India. The highest mortality due to Nipah virus infection has occurred in Bangladesh, where outbreaks are typically seen in winter.[22] Nipah virus first appeared in 1998, in peninsular Malaysia in pigs and pig farmers. By mid-1999, more than 265 human cases of encephalitis, including 105 deaths, had been reported in Malaysia, and 11 cases of either encephalitis or respiratory illness with one fatality were reported in Singapore.[23] In 2001, Nipah virus was reported from Meherpur District, Bangladesh[24][25] and Siliguri, India.[24] The outbreak again appeared in 2003, 2004 and 2005 in Naogaon District, Manikganj District, Rajbari District, Faridpur District and Tangail District.[25] In Bangladesh there were also outbreaks in subsequent years.[26]

Abstract

Nipah (Nee-pa) viral disease is a zoonotic infection caused by Nipah virus (NiV), a paramyxovirus belonging to the genus *Henipavirus* of the family Paramyxoviridae. It is a biosafety level-4 pathogen, which is transmitted by specific types of fruit bats, mainly *Pteropus* spp. which are natural reservoir host. The disease was reported for the first time from the Kampung Sungai Nipah village of Malaysia in 1998. Human-to-human transmission also occurs. Outbreaks have been reported also from other countries in South and Southeast Asia. Phylogenetic analysis affirmed the circulation of two major clades of NiV as based on currently available complete N and G gene sequences. NiV isolates from Malaysia and Cambodia clustered together in NiV-MY clade, whereas isolates from Bangladesh and India clusterered within NiV-BD clade. NiV isolates from Thailand harboured mixed population of sequences. In humans, the virus is responsible for causing rapidly progressing severe illness which might be characterized by severe respiratory illness and/or deadly encephalitis. In pigs below six months of age, respiratory illness along with nervous symptoms may develop. Different types of enzyme-linked immunosorbent assays along with molecular methods based on polymerase chain reaction have been developed for diagnostic purposes. Due to the expensive nature of the antibody drugs, identification of broad-spectrum antivirals is essential along with focusing on small interfering RNAs (siRNAs). High pathogenicity of NiV in humans, and lack of vaccines or therapeutics to counter this disease have attracted attention of researchers worldwide for developing effective NiV vaccine and treatment regimens.

Keywords: Nipah virus (NiV), bats, diagnosis, encephalitis, epidemiology, pathology, prevention, control, vaccines, therapeutics, zoonosis

Introduction

Viral diseases like Avian/bird flu, Swine flu, Middle East respiratory syndrome coronavirus (MERS-CoV), Severe acute respiratory syndrome (SARS), Crimean-Congo haemorrhagic fever (CCHF), Lassa fever, Rift Valley fever (RVF), Marburg virus disease, Ebola, Zika, Nipah and Henipaviral diseases pose considerable risk of an international public health emergency, when these spread rapidly (Rizzardini et al. 2018). After the recent emergency situations created by Ebola and Zika virus during past five years (Singh et al. 2016, 2017), now Nipah virus disease outbreaks have created panic in the public. Ebola virus disease (EVD) outbreaks and epidemics (2014–2016) led a massive mobilization of researchers to seek new technologies in terms of developing efficient and rapid diagnostics, vaccines, therapies and drug targets to combat EVD and save lives of large human population across the globe. Like Zika, scientists are on the way to counter Nipah virus.

Nipah (Nee-pa) viral disease is a zoonotic infection and an emerging disease caused by Nipah virus (NiV), an RNA virus of the genus *Henipavirus,* family Paramyxoviridae, which is transmitted by specific types of fruit bats, mainly *Pteropus* spp. (Halpin et al. 2000; Vandali and Biradar, 2018). NiV is a highly fatal virus posing potential threat to global health security. The *Pteropus* bats, *viz*., *P. vampyrus, P. hypomelanus, P. lylei* and *P. giganteu,* were associated with outbreaks of the Nipah viral disease in various countries of South and Southeast Asia, including Bangladesh, Cambodia, East Timor, Indonesia, India, Malaysia, Papua New Guinea, Vietnam and Thailand (Hayman et al. 2008; Sendow et al. 2010; Wacharapluesadee et al. 2010; Halpin et al. 2011; Hasebe et al. 2012; Yadav et al. 2012; Field et al. 2013; de Wit and Munster, 2015a; Majid and Majid Warsi 2018). Fruit bats are the major reservoirs of the virus and it is the contact with such bats (infected) or intermediate hosts like pigs which are responsible for infection in man. It is to be remembered that various biologic as well as genetic features of various paramyxoviruses are retained by Nipah virus (Bellini et al. 2005). Dependence on animal rearing as a source of additional income in many Asian countries is a predisposing factor for emergence of novel zoonoses like Nipah (Bhatia and Narain 2010). Various studies reported that major factor responsible for emergence of NiV was thorough interaction between wildlife reservoir particularly fruit bats of the *Pteropus* spp. with animal population reared and managed under intensive conditions (Daszak et al. 2013). The high fatality rate associated with Nipah disease and the lack of efficacious treatment and vaccines against it, classify it as a global threat (Epstein et al. 2006; Rahman and Chakraborty 2012). The disease was recognized for the first time in 1998 in Kampung Sungai Nipah village, state of Perak, Malaysia. The causative agent was characterized and since then has been named as “Nipah virus (NiV)”. The zoonotic potential of NiV was unknown before 1999 till Malaysia experienced Nipah viral outbreak. Such an outbreak had created alarming situation in the public health community globally as far as the potential of severe pathogenicity as well as viral distribution in widespread fashion are concerned (Chua 2012). Considerable uncertainty exists about the patterns of Nipah virus circulation in bats and the epidemiological factors associated with its spill-over into pigs and horses (McCormack 2005).

Encephalitis (acute) along with high mortality is the main manifestation of infection due to NiV. Apart from this there may be development of pulmonary illness and sometimes the infection may be asymptomatic in nature (Kitsutani and Ohta 2005). Myoclonus (segmental) along with tachycardia may become evident. The involvement of brain stem, which locates the major vital centres, is probably responsible for death and mortality may vary between 32% and 92%. From a diagnostic point of view serology is quite helpful but discrete, high signal lesions can be visualized best by fluid-attenuated inversion recovery (FLAIR) where the effect of cerebrospinal fluid (CSF) is reduced, so that an enhanced MRI image can be obtained (Arif et al. 2012). Nipah virus was first isolated in 1999 (Farrar 1999; Rahman et al. 2012). Gene sequencing of the isolates showed that the outbreak involved two different NiV strains, probably with different origins (AbuBakar et al. 2004). The clinical signs and symptoms of the NiV disease include fever along with laboured breathing, cough and headache. Encephalitis along with seizures are the complications involved (Broder et al. 2013). Survivors of NiV infection develop symptoms of neurological malfunction such as encephalopathy, cerebral atrophy, change in behavior, ocular motor palsies, cervical dystonia, weakness and facial paralysis, which remain for several years (Sejvar et al. 2007). Despite an increasing risk, rigorous studies that collate data from Nipah infections of pigs, bats and humans have been scarce (Hsu et al. 2004; Chadha et al. 2006; Pulliam et al. 2012). Serosurveillance studies in multiple host species may yield important insights into NiV

epidemiology (Weingartl et al. 2009; Li et al. 2010; Rockx et al. 2010; Pallister et al. 2011; Fischer et al. 2018).

The NiV belongs to the *Henipavirus* genus under the family Paramyxoviridae. This genus alsocontains Cedar virus (CedPV) and Hendra virus (HeV). Molecular studies have significantly improved our understanding of the genetic diversity of Henipaviruses (Wang et al. 2001; Rockx et al. 2012).The almost annual occurrence of Henipaviruses in South-Eastern Asia and Australia since the mid 1990s is noteworthy. In Australia alone 48 cases of Hendra viruses and in south eastern parts of Asia 12 outbreaks of Nipah viruses have been reported which not only hit the health sector but also the economic stability of these nations (Aljofan, 2013). There have been a total 639 human cases of NiV infection reported from Bangladesh (261 cases), India (85 cases), Singapore (11 cases), Philippines (17 cases) and Malaysia (265 cases), with a mortality rate of about 59% (Ang et al. 2018). This points to the survival efficiency of NiV in nature and the history on its species jumping/host adaptation pattern adds to the public health concerns posed by this virus. Detailed studies and clinical therapeutic trials on various animal models such as guinea pigs, hamsters, ferrets, cats, pigs and African green monkeys are being investigated for Henipaviruses (Geisbert et al. 2012). The Nipah disease outbreak in 2001 in Siliguri and latest in Kerala have emphazised the need for an efficacious vaccine against it. Moreover the virus imposes threat to health of public (Sharma et al. 2018). Enhanced monitoring and surveillance for Nipah infection and the development of an efficacious vaccine are the needs of the hour.

This review discusses in detail the NiV biology, its transmission and epidemiology, pathology, and advances in diagnosis, vaccine designing, and suitable prevention and control studies to be adopted to counter this emerging pathogen.

Go to:

2. Nipah virus

Nipah virus (NiV) is a paramyxovirus (*Henipavirus* genus, *Paramyxovirinae* subfamily, *Paramyxoviridae* family, order *Mononegavirales*), an emerging virus that can cause severe respiratory illness and deadly encephalitis in humans. It is a negative sense, single-stranded, nonsegmented, enveloped RNA virus possessing helical symmetry. The RNA genome, from the 3′-5′, contains consecutive arrangement of six genes, *viz*., nucleocapsid (N), phosphoprotein (P), matrix (M), fusion glycoprotein (F), attachment glycoprotein (G) and long polymerase (L). The N, P and L attached to the viral RNA forming the virus ribonucleoprotein (vRNP). F and G proteins are responsible for cellular attachment of the virion and subsequent host cell entry (Ternhag and Penttinen 2005; Ciancanelli and Basler 2006; Bossart et al. 2007). The newly produced precursor F protein (F0) is cleaved into two subunits, *viz*., F1 and F2, by host protease. The fusion peptide of the virus contained in the F1 subunit drives the viral and host cellular membrane fusion for the virus entry (Eaton et al. 2006). The virus M protein mediates morphogenesis and budding. Antibody to the G protein is essential for neutralization of the NiV infectivity (Bossart et al. 2005; White et al. 2005). It is quite noteworthy that through the coordinated efforts of the fusion (F) (class I) and attachment (G) glycoproteins the target cell (i.e. host cell) is entered upon after binding by the enveloped Henipaviruses including NiV. Interactions between Class B ephrins (viral receptors) on host cells and the NiV glycoprotein (G) trigger conformational changes in the latter, leading to activation of F glycoprotein and membrane fusion (Steffen et al. 2012). It is believed that the strategies of replication as well as fusion of the ephrin receptors are responsible for greater pathogenicity of these viruses. Multiple accessory proteins encoded by Henipaviruses aid in host immune evasion(Marsh and Wang 2012).

NiV infects its host cells *via* two glycoproteins, i.e. G and F proteins. The G glycoprotein mediates attachment to host cell surface receptors and the fusion (F) protein makes fusion of virus-cell membranes for cellular entry. The G protein of NiV binds to host ephrin B2/3 receptors and induces conformational changes in G protein that trigger the F protein refolding (Liu et al. 2015). Wong et al. (2017) have demonstrated that monomeric ephrinB2 binding leads to allosteric changes in NiV G protein that pave the way to its full activation and receptor-activated virus entry into the host cells. Recently, viral regulation of host cell machinery has been revealed to target nucleolar DNA-damage response (DDR) pathway by causing inhibition of nucleolar Treacle protein that increases *Henipavirus* (Hendra and Nipha virus) production (Rawlinson et al. 2018). A diagrammatic structure of Nipah virus is depicted in Figure 1.

Nipah virus

First outbreak

Ipoh, Perak

Index case

September 1998

Confirmed cases

265

Deaths

105

The 1998–1999 Malaysia Nipah virus outbreak was a Nipah virus outbreak occurred from September 1998 to May 1999 in the states of Perak, Negeri Sembilan and Selangor in Malaysia. A total of 265 cases of acute encephalitis with 105 deaths caused by the virus were reported in the three states throughout the outbreak.[1] The Malaysian health authorities at the first thought Japanese encephalitis (JE) was the cause of infection which hampered the deployment of effective measures to prevent the spread before being finally identified by a local virologist from the Faculty of Medicine, University of Malaya that it was a newly discovered agent named Nipah virus (NiV). The disease was as deadly as the Ebola virus disease (EVD), but attacked the brain system instead of the blood vessels.[1][2] University of Malaya's Faculty of Medicine and the University of Malaya Medical Centre played a major role in serving as a major referral centre for the outbreak, treating majority of the Nipah patients and was instrumental in isolating the novel virus and researched on its features.

This emerging diseases where it caused major losses to both animal and human lives, affecting livestock trade and created a significant setback to the swine sector of the animal industry in Malaysia.[3] The country also became the origin of the virus where it had no more cases since 1999 but further outbreaks continue to occur in Bangladesh and India.[4][5]

[...]

Background[edit]

The virus firstly struck pig-farms in the suburb of Ipoh in Perak with the occurrence of respiratory illness and encephalitis among the pigs where it is firstly thought to be caused by Japanese encephalitis (JE) due to 4 serum samples from 28 infected humans in the area tested positive for JE-specific Immunoglobulin M (IgM) which is also confirmed by the findings of World Health Organization (WHO) Collaborating Centre for Tropical Disease at the Nagasaki University.[1] A total of 15 infected people died during the ensuing outbreak before the virus began to spread into Sikamat, Nipah River Village and Pelandok Hill in Negeri Sembilan when farmers affected by the control measures began to sell their infected pigs to these areas.[1] This resulted 180 patients infected by the virus and 89 deaths. With further movement of the infected pigs, more cases emerged from around Sepang District and Sungai Buloh in Selangor with 11 cases and 1 death reported among abattoir workers in Singapore who had handled the infected pigs imported from Malaysia.[1]

Authorities response and further investigation[edit]

Since the cause was firstly wrongly identified, early control measures such as mosquito foggings and vaccination of pigs against JE were deployed to the affected area which proved to be ineffective since more cases emerged despite the early measures.[1] With the increasing deaths reported from the outbreak, this caused nationwide fear from the public and the near collapse of local pig-farming industry.[1] Most healthcare workers who were taking care of their infected patients had been convinced that the outbreak was not caused by JE since the disease affected more adults than children, including those who had been vaccinated earlier against JE.[1] Through further autopsies on the deceased, the findings were inconsistent from the earlier results where they suggest it may come from another agent.[1] This was supported with several reasons such as all of the infected victims had direct physical contacts with pigs and all of the infected pigs had developed severe symptoms of barking cough before dying.[1] Despite the evidence gathered from autopsies results with new findings among local researchers, the federal government especially the health authorities insisted that it was solely caused by JE which delayed further appropriate action taken for the outbreak control.[1]

Identification of the source of infection[edit]

In early March 1999, a local medical virologist at the University of Malaya named Dr Chua Kaw Beng finally found the root cause of the infection.[2] Through his findings, the infection was indeed caused by a new agent named Nipah virus (NiV), taken from the investigation area name of Nipah River Village (Malay: Kampung Sungai Nipah),[6] where it is still unknown to available science records at the time.[1][7] The virus origin is identified from a native fruit bat species.[8] Together with the Hendra virus (HeV), the novel virus is subsequently recognised as a new genus, Henipavirus (Hendra + Nipah) in the Paramyxoviridae family.[1] He found that NiV and HeV shared enough epitopes for HeV antigens to be used in a prototype serological test for NiV antibodies which helped in the subsequent screening and diagnosis of NiV infection.[1] Following the findings, widespread surveillance of pig populations together with the culling of over a million pigs was undertaken and the last human fatality occurred on 27 May 1999.[1] The outbreak in neighbouring Singapore also ended with immediate prohibition of pigs importation to the country and their subsequent closure of abattoirs.[1] The virus discovery received the attention from the American Centers for Disease Control and Prevention (CDC), Commonwealth Scientific and Industrial Research Organisation (CSIRO) and Singapore General Hospital (SGH) who giving swift assistance towards the characterisation of the virus and the development of surveillance and control measures.[1]

Aftermath[edit]

Until 2010s, the pig farming ban on Pelandok Hill was still in force to prevent the recurrence of the outbreak despite some people had quietly restarted the business after being instigated by community leaders.[9] Most of the surviving pig farmers have turned to palm oil and Artocarpus integer (cempedak) cultivation.[10] Since the virus has been named Nipah from the sample taken in Nipah River Village of Pelandok Hill, the latter area has become synonyms with the deadly virus.[11]

Memorials[edit]

In 2018, the outbreak are being memorialised in a newly constructed museum named Nipah River Time Tunnel Museum in the Nipah River Village with several of the surviving victims stories have been filmed in a documentary which will be featured at the museum.[10]

The disease was as deadly as Ebola, but instead of attacking blood vessels, it attacked the brain. Young men would be healthy one day, the next day their brains would swell up. They couldn't walk or talk. They'd become comatose and some of them became paralysed. Yet the Malaysian government told people not to worry, it said the disease was coming from mosquitoes and it had it under control because it was spraying for mosquitoes. Both C. T. Tan and Kaw Bing Chua thought the government was wrong and there was one big clue: No Muslims were getting sick, mosquitoes don't care which religion you practice so if the disease was coming from mosquitoes, you would have Muslims, Hindus and Christians getting sick. But only Chinese Malaysians were catching the disease — and even more specifically, only Chinese farmers raising pigs. As you know, Muslims don't handle pigs.

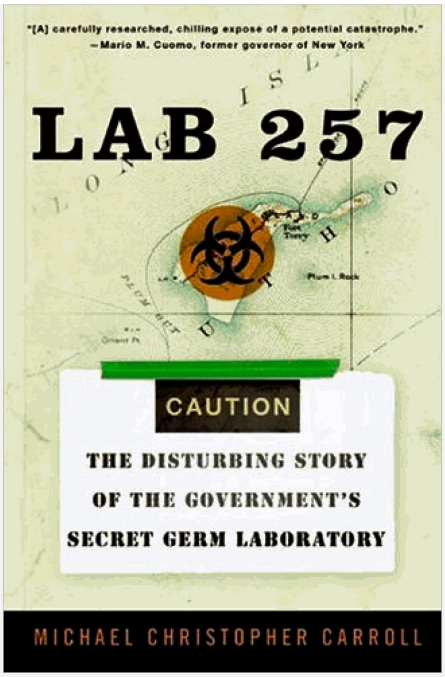
2003 Book - "Lab 257" - Select section referring to "Nipah"

Book by Michael Carroll - [HB0033][GDrive] / See **Plum Island Animal Disease Center**



cover : [HB005X][GDrive]

The New York Times revealed in late 1999 that the USDA was quietly upgrading [Plum Island Animal Disease Center] from a biosafety level three to a biosafety level four laboratory. The story provoked a howl of protest from Long Island's east end communities. The structural difference between BSL-3 and -4 is minimal—face respirators are worn while working with "hot" agents in a level three facility, while level four requires full-body spacesuits. Here's the important difference: the level four germs. Once upgraded, Plum Island joins charter members CDC and Fort Detrick in an exclusive club whose membership benefits include working with agents, lethal ones that have no vaccine and no cure. These include mad cow disease, the **Nipah pig virus** (that killed a million pigs and 265 people in Malaysia in 1999), and the Ebola, Marburg, and Machupo hemorrhagic fever viruses (all related to Rift Valley fever virus). Biosafety level distinctions, however, never deterred Plum Island research in the past. For example, Rift Valley fever virus and glanders bacteria are classified borderline germs, lying between biosafety levels three and four. Both are biological warfare agents and have been studied intensively at Plum Island. Some literature classifies glanders, the bacteria used by Germany in World War I, as level three, yet a federal government document relating to 1989 Plum Island research is titled "Biosafety for Animal Rooms with Glanders—Biosafety Level 4."

Despite the USDA's secret efforts, Congressman Mike Forbes, Hochbrueckner's successor, who had eyed Plum Island skeptically since his surprise visit with Karl Grossman, intervened and killed the BSL upgrade line item in the 2001 federal budget. For the first time, the local community triumphed over the USDA's designs for Plum Island. The USDA again pushed to upgrade Plum Island after September 11, 2001, but it has been fought off thus far by Forbes's two successors.

When news of the BSL-4 upgrade came out on the heels of the 1999 West Nile virus outbreak, former employees and local environmental groups bombarded local officials—including New York State Assemblywoman Patricia Acampora—with phone calls. [..]

1999 (May 25) - NYTimes : "THE DOCTOR'S WORLD; Killer Smallpox Gets a New Lease on Life"

By Lawrence K. Altman, M.d. / May 25, 1999

https://www.nytimes.com/1999/05/25/science/the-doctor-s-world-killer-smallpox-gets-a-new-lease-on-life.html?searchResultPosition=77

1999-05-25-nytimes-the-doctors-world-killer-smallpox.pdf

https://drive.google.com/file/d/1wEsAl87wvWlMF-g2vUh9qCk2Q8sXRNC4/view?usp=sharing

Smallpox, the ancient disease, was eradicated 20 years ago. Smallpox, the virus, is on death row, frozen in two highly protected laboratories in the United States and Russia. Like lawyers filing last-minute briefs, American scientists have come up with new arguments for reprieve.

Yesterday, with the backing of Russia and other governments, the World Health Organization formally bowed to their wishes and granted the virus yet another stay. In keeping with action taken last week, the United Nations subagency in Geneva said it would appoint another committee to study the arguments and help decide the virus's fate. It has now been put off until June 2002.

By then, the Geneva-based organization hopes, the committee may have figured out whether there is any reason to keep stocks on hand.

For example, research using the virus might yield drugs against the disease, or improved vaccines to prevent it. These would be of no use, in effect, unless some rogue nation unleashed hidden stores of **smallpox virus in a biological terror attack, a prospect no longer regarded as outlandish.** Or use of new techniques might decipher some of smallpox's distinctive features, providing clues to help fight other diseases.

Ordinarily, such broad research goals would attract little attention until they produced important findings. But there is nothing ordinary about smallpox. It was one of the deadliest scourges, killing one in three victims, peasants and monarchs alike. The virus, known as variola, usually left survivors with deep, pitting scars on the face and body, and often blinded them.

Smallpox was the first disease prevented by a vaccine, one developed by Edward Jenner in 1798, and **it was the first and only disease to be wiped out, by the World Health Organization in 1979.** Variola lives only in people. After epidemiologists tracked down the last cases and focused vaccinations on areas where they occurred, they broke the human-to-human chain of infection. The virus came to a dead end. Only the research stocks remained. Few opposed the health organization's proposal that they be destroyed, in what would be the first deliberate extinction of a life form.

But attitudes began to change in recent years when a shocked world learned that Russia had secretly stockpiled tons of smallpox virus and manipulated it for use as a possible weapon. During that period, Moscow supported the disease's eradication. North Korea and other countries are believed to have clandestine supplies of smallpox virus as well.

Until Russia's duplicity and secret stores were exposed, scientists elsewhere had virtually abandoned smallpox research largely because the disease was gone.

Scientists are the people most knowledgeable about smallpox and presumably have the most at stake in the decision. Astonishingly, with rare exception, scientists have had little to say about the proposed action.

"The sense was that it was out of our hands, that it was a done deal between W.H.O. and the C.D.C.," said Dr. Ronald Luftig of Louisiana State University, referring to the World Health Organization and the Centers for Disease Control and Prevention in Atlanta. Dr. Luftig is an official of the American Society for Virology and American Society for Microbiology, both of which officially support destruction of variola.

But the potential use of hidden stores of virus as a weapon are changing that picture. First, the release of the virus among the world's largely unvaccinated population could kill millions of people. Second, the Clinton Administration's pledge to spend millions of dollars on bioterrorism defenses makes smallpox research a potential source of money for interested scientists.

Scientists in the United States, Russia and elsewhere have begun to debate, often bitterly, why W.H.O. should insist on destroying a virus that might still exist secretly in other countries.

A crucial point in the debate is that irrevocable destruction of the virus would deprive future generations of the opportunity to use new knowledge and research tools to solve the many mysteries of smallpox, and thereby unravel mysteries of other ailments as well.

''Everyone can envision situations in which you might want to take the virus from the freezer,'' said Dr. Harold E. Varmus, who heads the National Institutes of Health.

Dr. Clarence J. Peters, an international leader in virology who works with smallpox and other lethal viruses at the Centers for Disease Control, said, ''I have been on both sides of the argument at different times.''

But several factors make variola studies difficult.

One is that such work must take place in a laboratory with the highest biosecurity standards. Scientists must wear a protective spacesuit, isolating them from the laboratory. They wear gloves that increase the difficulty of handling small vials. The air they breathe is filtered. On leaving the laboratory, they must take two showers, the first with a disinfectant. The aim is to protect themselves and the community.

"It's a nuisance to do experiments in that environment," said Dr. Frank Fenner of Canberra, Australia, a top expert on the pox family of viruses and a leader in the eradication effort.

There are few high security laboratories, and W.H.O. wants work on smallpox to be limited to two sites: the C.D.C. in Atlanta and Russia's State Research Center of Virology and Technology, better known as Vector.

Competition among scientists for time in the Atlanta laboratory is intense. Investigations of other deadly viruses, like the newly discovered Nipah virus, which has recently killed more than 100 people in Malaysia, have highest priority.

Responding to a W.H.O. request, scientists will soon pull variola from a freezer at the centers in Atlanta for the first time in four years, said Dr. Brian W. J. Mahy, who oversees the agency's smallpox work. For about a month they will grow the virus, inactivate it with radiation, and prepare viral proteins that might be used in standard laboratories to develop more rapid tests to help doctors detect smallpox, since so few have ever seen it.

Experts who favor destroying variola say that most important research questions about smallpox could be answered from work conducted in less secure laboratories. Such work would involve different viruses belonging to the pox family that affect monkeys, camels and other species.

The most compelling reason for keeping variola is to discover potentially lifesaving drugs in case the virus ever reappears, either naturally or as an act of war or terrorism. A report on these research needs, issued in March by the Institute of Medicine, the medical arm of the National Academy of Sciences, was pivotal in President Clinton's decision to reverse course and advocate retaining the virus.

Few potential anti-variola drugs exist, and scientists are handicapped in developing new ones because the virus naturally infects only humans and so there is no animal model for drug tests. "That's where we are stuck with smallpox," Dr. Mahy said.

Nevertheless, Food and Drug Administration approval of 20 antiviral drugs in the last 10 years offers hope of eventually discovering other drugs that would be effective against variola, said Dr. Martin S. Hirsch, a virologist at Harvard University who is a member of the Institute of Medicine committee.

Variola is one of the biggest viruses, with about 200 genes compared with 9 for the AIDS virus and 3 for the Rift Valley fever virus. Thus variola offers many targets for drugs.

Dr. Mahy said C.D.C. scientists were looking at new ways to develop potential anti-variola drugs.

Dr. Stanley Falkow of Stanford University, a former president of the American Society for Microbiology, said "epidemic diseases of humans are quite recent in the evolutionary sense because human populations were not big enough to sustain epidemics until about 5,000 years ago, and we don't know" how best to study them now.

Among smallpox's many unusual features is that a different virus is used to prevent it. Most vaccines are derived from weakened or killed strains of the same virus that they prevent.

Only two other diseases are fought with vaccines derived from different viruses. One is a new rotavirus vaccine made from a monkey strain to protect humans against the diarrheal illness. Veterinarians use a vaccine prepared from turkey herpes virus to protect chickens against Marek's disease, which is caused by a different herpes virus.

If scientists understood the small differences in genetic makeup between smallpox and the vaccinia viruses that protect against it, smallpox might serve as a model to develop immunizations for diseases, like dengue fever and AIDS, for which vaccines are needed.

The eradication of smallpox documents the effectiveness of the standard vaccine, but the remaining supplies are dwindling as many vials lose potency. If scientists tried to replace the vaccine with a safer one, particularly for people with immune deficiencies from AIDS or treatment for cancer, live variola might be needed for such research, said the Institute of Medicine committee, which was headed by Dr. Charles C. J. Carpenter of Brown University.

But Dr. Donald A. Henderson, who led the smallpox eradication program, said lack of human cases and an animal model made it impossible to test safety and effectiveness of new drugs and vaccines against variola. ''One could never be certain that they were protective until actually used,'' said Dr. Henderson, a former deputy White House science adviser.

- **NOTE : "Donald A Henderson ..** Henderson served as Chief of the CDC virus disease surveillance programs from 1960 to 1965, working closely with epidemiologist Alexander Langmuir. Du "
- https://en.wikipedia.org/wiki/Donald_Henderson
- https://en.wikipedia.org/wiki/Alexander_Langmuir

Also, scientists know very little about what makes some viruses more virulent than others. Dr. Varmus of N.I.H. and Dr. Anthony S. Fauci, who heads the National Institute of Allergy and Infectious Diseases, expressed hope that future studies of variola's genes and the way the virus kills cells would help unravel mysteries about the more general nature of why many infectious agents harm humans.

Scientists can use newer techniques to make mutations in viruses in the laboratory to study the effects of different genes in new ways.

In advocating retention of variola, Dr. Varmus said that as scientists learned more about how viruses harmed humans, the virus that was such a scourge ''ought to be available for study if we had an important experiment to test.''

At W.H.O.'s request, Russian and American scientists mapped the complete DNA sequences of three strains of variola. W.H.O. believed that such information would be a sufficient knowledge base for future research and for comparing viruses released by terrorists or somehow emerging from nature.

But a number of scientists challenged that view, saying that sequences alone could not determine a virus's vulnerability to a drug.

Speaking of the unpredictability of research, Dr. Fauci said, ''You might never take the virus from the freezer, but at least you have it.''

1999 (June 9) - NYTimes : "Amid Scare, Asians Extend Bans on Food From Europe"

https://www.nytimes.com/1999/06/09/news/amid-scare-asians-extend-bans-on-food-from-europe.html?searchResultPosition=34

1999-06-09-nytimes-amid-scare-asians-extend-bans-on-food.pdf

https://drive.google.com/file/d/1XfZgMHG4fdhZhg94PK-_vscEyGwjAsw1/view?usp=sharing

By Philip Segal, International Herald Tribune

HONG KONG— The European Union sought Tuesday to prevent its growing food scandal from turning into a trade dispute with Asia as countries across the region imposed or extended bans on the import of European food.

South Korean officials in Brussels received complaints from France and the Netherlands that Seoul's ban on pork from the two countries was "draconian," according to an Agence France-Presse report citing the South Korean news agency Yonhap.

Although Belgium is the source of the food scare in Europe, animal feed from Belgium containing a cancer-causing chemical, dioxin, may have been used in several other European countries.

"In this case the proof in the pudding is not in eating it, but in testing it," said Etienne Reuter, head of the office of the European Commission in Hong Kong. "But if there's a doubt, one has to accept that people take these measures to protect their consumers.

"I certainly would not wish to see this in terms of a trade war. You have to see this uniquely in terms of protecting the consumer and restoring confidence."

he list of places in Asia banning products grew Tuesday as Taiwan suspended imports of 77 kinds of Belgian egg, dairy and meat-based farm products.

The Philippines banned all poultry, beef and pork products from Belgium, the Netherlands, France and Germany, and Thailand said it had banned Belgian meat, poultry and dairy products as of Monday. Malaysia, South Korea, Hong Kong and Singapore have already announced bans on various European food imports.

Part of what is making the bans on European food so sweeping is the dearth of information coming out of Belgium about the possible extent of the contamination, a source of considerable tension within the European Community.

As stores in Hong Kong moved to clear their shelves of six brands of European infant formula, a Hong Kong government spokesman said the ban "was taken as a precautionary measure and mothers do not have to be over anxious," but that "it will be safer to avoid these milk formulas until clarification and assurance can be obtained" from the countries concerned.

For some Asian countries, the bans have a considerable impact, but not critical to maintaining sufficient food supplies. In Hong Kong, which has now extended the ban on pork and poultry to include beef and dairy products from Belgium, the Netherlands, France and Germany, the import restrictions will affect 30 percent of the baby formula market, 18 percent of the market for fresh eggs, and 10 percent for poultry, according to European Community figures.

Food scares are nothing new to Asia. The Belgian scandal has led to the worst one in Europe since the bovine spongiform encephalopathy — or "mad cow"— crisis over British beef in 1996, but since that time Asia has had several of its own food crises at least as serious as the one in Europe.

This year, Malaysia has slaughtered more than 900,000 pigs to contain outbreaks of two viruses, Japanese encephalitis and Nipah.

1999 (Sep 22) - NYTimes : "Long Island Lab May Do Studies Of Bioterrorism"

By Judith Miller / Sept. 22, 1999 / Source : [HN01LG][GDrive] / See **Plum Island Animal Disease Center**

Alarmed at what the Clinton Administration views as the growing threat of biological terrorism to America's food supply, the Agriculture Department is seeking money to turn the Plum Island Animal Disease Center, one mile off Long Island, into a top security laboratory where some of the most dangerous diseases known to man or beast can be studied.

The Agriculture Department already operates here at Plum Island, just across Gardiners Bay from the wealthy Hamptons, a laboratory where such dreaded foreign animal diseases as foot-and-mouth and African swine fever are examined. But the department is seeking $75 million this year and $140 million over the next two years to upgrade the center to handle even more dangerous animal diseases that can affect humans.

While there are four civilian and military laboratories in America equipped to study such diseases -- technically known as Biosafety Level Four facilities -- their work is focused on germs that primarily affect humans, not domestic animals or plants.

[...]

Plum Island, which was once operated by the United States Army Chemical Corps, was designated as an animal-disease research center and transferred to the Agriculture Department in the early 1950's. It is already what scientists call an agricultural ''Biosafety Level Three'' center, which means that its containment areas, which hold germs dangerous to animals, have filtered air, sealed doors and negative air pressure that prevents germs from leaking out of the labs. Liquid waste is decontaminated.

All who enter the labs wear white lab coats and slippers. After leaving the containment areas, they are required to shower, shampoo their hair, scrub their nails and rinse their mouths, since lethal germs can live in human throats and infect animals up to two days later. To stop viruses or microbes from escaping to the mainland, no clothing or articles, even eyeglasses, are permitted to leave the labs without being soaked in disinfectant, said Dr. Alfonso Torres, the deputy administrator of the Agriculture Department's Veterinary Services Division and former director of the center, who conducted this reporter on a tour.

[...]

Moving to the next level of bio safety would require that scientists working with dangerous pathogens wear the protective decontaminated suits portrayed in movies like ''Outbreak,'' and breathe only filtered air pumped into their hoods. Such precautions would allow scientists to work with even more dangerous animal pathogens that can affect humans, like the Hendra virus, which afflicts horses, and the Nipah pig virus, named for the Malaysian village in which it was first isolated this year. The virus has already killed more than 100 people.

''We intend to work closely with local officials and community groups to allay any concerns about safety,'' said Dr. Horn, who acknowledges that Plum Island has long been shrouded in mystery and plagued by what he and Dr. Torres call unfounded rumors and fears.

The 850-acre island was opened to news organizations only in 1992 in response to concerns about safety at the center. **In 1995, the Department of Agriculture was fined $111,000 for illegally storing hazardous chemicals here. Since then, the agency has changed the contractor who operates the island, and there have been no violations.**

The extent of the threat posed by agro-terrorism remains in dispute, even within the Clinton Administration. Some scientists and terrorism analysts argue that there is little reason to believe that terrorists would attack American agriculture or livestock.

But intelligence reports increasingly conclude that several countries, including Iraq, have developed germs to attack the food supplies of their adversaries. And senior American officials now believe that an outbreak of screwworm, a parasite that afflicts animals and people, was spread deliberately 14 years ago in Mexico less than 50 miles from the Texas border by workers who were employed in a screwworm eradication program and feared the loss of their jobs.

[...]

Fueled by growing concern about the proliferation of such expertise and such dangerous germs, President Clinton ordered the Government last year to prepare defenses against germ and other unconventional attacks on the nation's plants and animals. In January, Dr. Horn recruited four former Pentagon intelligence analysts and terrorism experts to form the Agricultural Research Services' first unit to evaluate such threats. In April, the White House formally included the Agriculture Department in the group of agencies that meet regularly under National Security Council aegis to weigh plans to deter or respond to unconventional terrorism, a $2.8 billion effort.

[...] **Senator Pat Roberts, Republican of Kansas, who is chairman of the Senate Armed Services Subcommittee on Emerging Threats and Capabilities, plans to hold hearings on agro-terrorism in October that will explore the Administration's plans for Plum Island. [...]**

1999 (Nov 28) - NYTimes : "Microscopic Guests On a Small Island Raise Big Fears; A Tour of Plum Island, a Center for Study of Viruses That's Being Considered for Even More Deadly Bugs"

NOTE - WHY MENTION NIPAH HERE ?

By John Rather / Nov. 28, 1999 / Source : [HN01LH][GDrive] / See **Plum Island Animal Disease Center**

[...]

As the federal Agriculture Department considers whether to seek congressional approval to make the 45-year-old Plum Island center the **only government laboratory in the country to study extremely virulent animal diseases that can also kill humans**, questions of safety and security are suddenly looming large.

The department and its highest-ranking experts have said that an animal disease center with labs that have the highest security rating, biosafety level four, are an absolute necessity for combating viruses that could attack cattle, pigs, sheep and other domestic herds, with the potential to devastate the country's $90 billion livestock industry.

Some of the diseases -- the kind scientists call zoonotic -- can also spread to humans with lethal effects, making them a double threat if they were used in a bioterrorist assault.

Fears of bioterrorism prompted the Clinton Administration to direct the Agricultural Department and other agencies to take steps to protect the country, and changes at Plum island could be part of the response.

Because Plum Island is now rated at biosafety level three for studying foreign animal viruses, the department has made no secret that the island is its first choice for the level four labs.

As the wheels begin turning, critics are already questioning the wisdom of importing viruses for which there are no known cures to an island off crowded Long Island and 95 miles from Manhattan.

[...]

In a spacious conference room, Wilda Martinez, the area director for the Animal Research Service, one of two Agriculture Department agencies at Plum Island, extended a welcome but minced no words.

Recent news reports, she said, have been inaccurate in their details, and have blurred the reasons the level four labs are needed. "Bioterrorism aside," she said, "it is apparent that the protection afforded by ocean barriers and geographic separation will no longer prevent the introduction of foreign animal diseases."

Dr. Alfonso Torres, a native of Colombia and the deputy administrator of the Animal and Plant Health Inspection Service, the other Agriculture Department agency at Plum Island, followed with a slide lecture intended to leave no doubt about the importance of the lab in protecting agriculture, the county's largest industry.

[Dr. Peter Keith Murray (born 1946)], the director of the Animal Research Service national animal disease center in Ames, Iowa, said Plum Island was already equipped to protect the public from exposure from even so dangerous a virus as the Nipah virus. That virus, hitherto unknown, spread among domestic swine in Malaysia, and then to farmers and farm workers. More than 250 people died and millions of swine were slaughtered to eradicate the outbreak, he said.

[Dr. Peter Keith Murray (born 1946)], a former head of what is now the world's only level four animal disease lab near the Australian city of Geelong, said the Nipah virus could be studied now in level three labs at Plum Island without endangering the public because lab safety systems would prevent the virus from ''escaping into the environment.''

But safety level three was ''not good enough,'' he said, to protect the laboratory's staff of 14 research scientists and more than 160 other employees, and therein lay the need for the upgrade to level four.

Researchers and others working with viruses in level four labs wear so-called ''space suits'' that are connected to external air supplies. The suits are not required in level three labs.

[Dr. Peter Keith Murray (born 1946)] and others said the need for the level four labs had been urgent and obvious for some time. ''Nobody is sure why, and there's a lot of speculation, but we are encountering more and more of these new diseases over the past 15 years,'' said Dr. Murray, citing the Nipah virus and mad cow disease in England as examples.

''Frankly, given the nature of emerging threats from around the world and here at home, it is very clear that U.S.D.A. must have access to BSL4 facilities,'' he said. ''We're all here today because of the talk Plum Island might be that site.''

[...]

On the tour Carmen Farrugia, a lab employee involved with shipping and receiving, demonstrated how viruses are shipped. First, a small amount of virus contained in a small vial was placed in a slightly larger vial with absorbent material, which in turn was placed in another container with more absorbent material.

The container was then packed in a box with a hard plastic liner, and capped with a spongelike material and often with dry ice. The box, she said, was designed to withstand a fall of 27 feet. The boxes, which bear labels warning of an infectious substance inside, are shipped by air.

''This gets shipped like cargo, like you were sending a package to grandma or something,'' Ms. Farrugia said.

In this way, viruses collected from other parts of the world were transported to Kennedy International Airport, where they are met by couriers with cell phones, decontamination kits and training in cleanup. The couriers then drove east on the Long Island Expressway ''except when there are traffic jams,'' Ms. Farrugia said, eventually taking Route 25 down the North Fork to Orient Point; the packages then traveled by boat to Plum Island.

Dr. Michael Kiley, the Animal Research Service safety officer at the lab, said the packages were designed to withstand a plane crash. Dr. Kiley also said that other government agencies, including the Federal Bureau of Investigation, would be involved in assuring shipment and lab security if Plum Island was upgraded to a level four center.

https://drive.google.com/file/d/170BT18__jTUd74LXK1mruEPCP_FGKZj8/view?usp=sharing

By Sheryl Gay Stolberg / Oct. 3, 1999

In an unmarked warehouse in the middle of a wheat field in central Ohio, a hulking 300-pound pig lies on her back, her legs tethered to a crude iron gurney in a bare, well-lighted room. The animal has been sedated into a light state of sleep, and the pale pink expanse of her belly rises and falls rhythmically with each breath. A young man in green hospital garb has just sliced a six-inch incision between the sow's nipples; now he pokes around her innards with latex-gloved hands.

The pig on the table is pregnant. The young man, a veterinary technician named Bruce Close, **is about to remove her newly fertilized eggs**. At 26, Close is an old hand at pig surgery; **he has performed this operation more than 600 times in the two years he has been employed by Nextran, the Princeton, N.J., biotechnology company that runs this warehouse as a breeding center**. **This, however, is no ordinary pig farm. For the past decade, Nextran has been locked in a high-stakes race to build the perfect pig: an animal with human genes, whose organs can be transplanted into people**. In the medical lexicon, this is known as **xenotransplantation**, and it has been an elusive dream of scientists for nearly 100 years.

Today, despite fears that pig-to-human transplants could unleash a deadly new virus, the dream is closer than ever to reality. In August, a long-awaited safety study conducted by Nextran's chief competitor, Imutran Ltd., of Cambridge, England, **found no evidence of active infection in 160 people who had been treated with pig tissue for a variety of conditions**. The findings come as the companies are laying the groundwork to begin testing transplanted organs in people. Sometime within the next few years, and possibly as soon as the end of next year, either the British or the Americans will grab the brass ring: approval from a regulatory agency, either the United States Food and Drug Administration or its equivalent in Britain, to perform the world's first animal-to-human transplant using a heart or a kidney from a genetically engineered pig.

Nobody expects cross-species transplants to be successful overnight. But with time, xenotransplantation could solve the most pressing crisis in medicine -- the organ shortage. It could also make the companies very rich. Unlike human organs, which are donated, pig organs will be sold, and in a climate in which demand far outstrips supply, the seller will name the price. By greatly expanding the donor pool, pigs could make transplants possible for tens of thousands of people who, because of the current rationing system, never even make the list, not to mention those in some Asian nations, where taking organs from the dead is culturally taboo. Imagine a therapy as revolutionary as penicillin and as lucrative as Viagra rolled into one.

In Ohio, Bruce Close is working toward that day. Moving quickly and in silence, he tears at layers of pig fat until he can feel the pig's uterus. Gently, he extracts the slippery pink-and-purple mass, palpating it until his fingers reach a cluster of 10 blood-rich pustules -- the ovulation points.'' **Each contains a single egg so recently joined with a sperm, through artificial insemination, that it has not yet divided from one cell into two. This is the optimal moment for creating ''transgenic'' piglets -- animals that, at least in a genetic sense, look ever so slightly like people.**

It is a bizarre, almost creepy sight, this big, fat pig upside down on an operating table, her head dangling backward over a bucket in case she vomits, her insides splayed out on a blue-paper surgical drape as a scientist rearranges the DNA of her unborn young. In a moment, the animal's eggs will be flushed out of the ovaries, collected in a tiny vial and smeared onto a glass slide; then a ''microinjectionist'' will examine them under a high-powered microscope and, with a needle finer than a strand of hair, insert a single human gene into each.

Later this afternoon, Close will return to the operating room to implant the growing embryos into a foster mother sow. In roughly 114 days, if all goes as Nextran hopes, she will deliver a litter that includes at least one transgenic piglet. Yet if Close sees anything Frankensteinian in this, he does not admit it. ''What I'm doing right now,'' he says, ''may someday save people's lives.''

Across the Atlantic Ocean, at an undisclosed location in the English countryside, Imutran is running its own transgenic pig farm. Like Nextran, which was purchased several years ago by Baxter International, one of the world's largest medical-products manufacturers, Imutran is owned by a drug-industry powerhouse, the Swiss-based Novartis Pharma AG, a company with three times the annual revenue and nearly seven times the research budget that Baxter has. While Nextran has been testing its pig hearts and kidneys in baboons, Imutran has been running tests in monkeys and baboons, and reporting longer survival times. Like Nextran, Imutran is facing mounting criticism as it moves closer to testing its organs in people.

Animal rights advocates, predictably, lament the fate of the poor pigs that will be used as spare-parts factories, a charge the companies shrug off by pointing to refrigerators stuffed with bacon and pork chops. What they cannot shrug off, however, are the very real safety concerns. The Campaign for Responsible Transplantation, a coalition of scientists and public-health professionals, has asked for a ban on cross-species transplant research. And one prominent xenotransplant expert, Dr. Fritz Bach, of Harvard University, who is a paid consultant to Novartis, has called for a national commission to study the risks.

And so the companies are proceeding quietly, insisting that there is no rush to the clinic. ''I don't believe that there is a race in the sense of, 'Oh, let's be first,''' says David White, Imutran's chief scientist. Says John S. Logan, Nextran's scientific director, ''What we all want to be is the first to be successful.''

But there is a race, and in science, as in life, being first counts. ''Clearly,'' says Jeffrey L. Platt, a transplant immunologist at the Mayo Clinic, in Rochester, Minn., ''there is a competition between the two companies to enter the clinical arena.'' The first ''whole organ'' xenotransplant will attract intense press coverage, giving whoever conducts it free publicity, not to mention a spot in the medical history books. And if being first means earning the confidence of regulators and the public, then being first may well be tantamount to being successful.

Platt, for one, says that if xenotransplants could be made as safe and effective as human transplants, they would replace them. ''Metaphorically speaking,'' he says, ''it will be like the automobile repair industry. Nobody makes much effort to rebuild parts, because it is cheaper and better for your car to have a brand-new part.''

If it sounds like science pushing itself to the edge of science fiction, it is. And like all good science-fiction stories, this one has the potential to end in disaster.

It is not easy to find ''the pig farm,'' as Nextran obliquely calls its breeding warehouse. The building sits at the end of a long gravel road on a slight knoll in the middle of a 200-acre lot in the little farming hamlet of Albany, Ohio. There are no signs outside, which is by design. ''We're not big on signs,'' Logan, the

Nextran scientist, explains. On the rare occasion when uninvited guests drop in with nosy questions, a supervisor dismisses them with a simple, if less than completely truthful, explanation: "We breed pigs."

With a shock of auburn hair draped across his forehead, and a reddish-brown beard covering his chin, Logan, 44, looks more like a lumberjack than a microbiologist. Born in Scotland, he still speaks with a strong accent after nearly two decades in this country, and he has the impatient manner of someone who is always hurrying to catch the next train. Where White, the Imutran scientist, is a master of public relations and charm, Logan is cautious and reserved. He is confident enough never to confess to being the underdog, but not cocky enough to make any grand predictions about success. "When we get to the day when we are sitting here and it really works," he says, "that's the day pronouncements will be worthwhile. That's the day you have to drive for. And that's what keeps me going."

Outsiders are rarely allowed at the Nextran farm. **The company line is that visitors are dangerous for the pigs; nobody sees the animals without showering first and donning company-issued, disinfected clothing, plus a surgical mask and gloves. But the policy, which includes a ban on photography, also suits Nextran's penchant for privacy, so as not to rile up animal rights advocates and antibiotech groups that oppose its work.** The Nextran warehouse looks more like a pig dormitory than a pig farm, with animals housed in various rooms that run along dimly lighted, narrow corridors. There is no mud. The water is tested several times a week. **The pigs are strict vegetarians; meat poses the risk of bovine spongiform encephalopathy, mad cow disease.**

On this particular morning, as is the case two or three mornings each week, the miracle of birth has come to the Ohio farm. In the farrowing room, where expectant sows are kept, more than two dozen newborn piglets scamper about in their stalls, their skin a translucent pink, their umbilical cords still dangling from their bellies. In 24 hours, the piglets will be tagged and numbered, and a Nextran animal handler will snip off a tiny bit of their tails; the snippets will be shipped to the company's laboratory in Princeton, where their genetic makeup will be analyzed to see if they contain the crucial gene, or in certain cases two genes, that Nextran believes will trick the human immune system into accepting pig organs.

The breeding process is ''horribly inefficient,'' Logan says. Typically, 20 pigs are born from every 100 gene-altered eggs, but only one is transgenic. The 19 less fortunate animals meet an untimely demise. So while there is something peculiarly endearing about the sight of these little pink critters, rooting for their first taste of mother's milk, Logan has no idea at this point if the animals are of any use to him. When I ask him what he sees, expecting perhaps some philosophical answer about the wonders of molecular biology, or the future health of mankind, he replies: ''I see a bunch of little pigs. That's all I see.''

At a time when biological tinkering has invaded every aspect of modern life, the sight of swine with human DNA should probably not seem alarming. Still, it is difficult to look at Nextran's pigs without wondering if there is an element of hubris to Logan's work, if porcine-people aren't better left to Greek mythology, or at least George Orwell, than to modern medicine. Clearly, in 1999, some pigs really are more equal than others.

Harold Vanderpool, a medical ethicist at the University of Texas Medical Branch, in Galveston, has a term for the visceral reaction these pigs evoke. "I call it 'the gag factor,'" he says. "We are thinking across a barrier that should never be crossed." And in point of fact, there may be a very good reason -- the viruses -- it should not be. Pigs have become the animal of choice in xenotransplant research for a variety of reasons. They are plentiful, and they breed easily. They are physiologically similar enough to humans. And pigs and people have lived side by side, in relative health and harmony, for centuries**. Virologists say most disease-causing germs can be eliminated through careful selection and breeding. But over the past two years, they have focused their attention on one obscure organism that cannot be bred out, the porcine endogenous retrovirus, abbreviated in the medical literature as PERV.**

Of all viruses, retroviruses are the most feared. They integrate their genetic code into the cells they infect, which means they multiply along with the cells. Retroviruses last for life. They are typically spread through blood or sexual contact, and they can lurk in the body for years, even decades, before causing any symptoms. ''It's like a ghost virus, a stealth virus,'' says Jonathan S. Allan, a virologist at the Southwest Foundation for Biomedical Research, in San Antonio. ''Once it splices itself into the host genome, it is virtually impossible to get it back out.''

If this scenario sounds familiar, it's because over the past two decades, another retrovirus, H.I.V., believed to have originated in apes, has cut a devastating swath around the world. Most scientists, Allan included, do not believe that xenotransplants will unleash the next AIDS epidemic. But no one, not even the companies, argues that the transplants will be risk-free. While there is thus far no evidence that PERV makes people sick, it can infect human cells in the test tube. And some experts theorize that the virus could mutate into a deadly form, as H.I.V. did, and then spread through sexual contact, infecting untold numbers before causing any symptoms. While the recent Imutran study is a comfort, it looked at only 160 patients, who had been treated in hospitals around the world and were later tracked down by Novartis. What will happen when people are getting xenotransplants by the tens of thousands?

The danger may not be limited to PERV. In January 1997, a pig farmer in Ipoh, a Malaysian village about 200 miles north of Kuala Lampur, became ill with what appeared to be encephalitis. The following year, 258 Malaysian pig farmers became sick; 101 of them died. It took until March of this year for the Centers for Disease Control and Prevention to identify the cause: a brand-new virus named Nipah.

This is a point that Allan, who serves on a panel of scientific experts convened by the Food and Drug Administration to plan for its first xenotransplant clinical trial, has made repeatedly. For all the focus on PERV, he says, there may be other viruses, about which much less is known, that in the end will pose a greater danger to the public health. To justify any human experiment, the scientists conducting it must show that the benefits to the patient outweigh the risk. But xenotransplants defy that calculation: the patient benefits while society takes the risk. "The individual," Allan warns, "can sign a consent form and say, 'I'll take the risk because I'm going to die anyway.' But that person is signing a consent form for the whole population, the whole human race."

Still, there are good reasons to proceed. More than 62,000 Americans are now waiting to receive donated hearts, lungs, livers, kidneys and pancreases, according to the United Network for Organ Sharing. A new name is added to the list every 16 minutes, and every day 11 people die waiting. Increasing donations will not solve the problem; surgeons need young, healthy organs for transplants, so even if every dead person donated, there would still not be enough.

There is another reason, of course: money. In 1996, Salomon Brothers predicted that the global market for transgenic organs could reach $6 billion by the year 2010, a figure that explains why big pharmaceutical companies are involved. Novartis manufactures cyclosporine, an antirejection drug; the market for it would skyrocket if xenotransplants became common. Baxter's interest is self-preservation; it makes dialysis machines, which would be relegated to the medical junk heap if people with failing kidneys were given pig organs instead.

Hospitals and surgeons stand to gain as well. Transplants are expensive, and they make a good living for those who perform them. Three years ago, the Institute of Medicine calculated that if animal organs made it possible to offer a transplant to everyone in the United States who needed one, annual expenditures would rise to $20.3 billion, from $2.9 billion. Already, the Mayo Clinic has entered into what its director of heart and lung transplantation, Dr.

Christopher McGregor, calls a "strategic alliance" with Nextran. McGregor is busy testing pig hearts in baboons, and the company has built a state-of-the-art breeding facility not far from the clinic so Mayo doctors can have a ready supply of pigs in the event that xenotransplantation takes off.

While the medical world is gearing up, so, too, is the Government. Donna E. Shalala, the Secretary of Health and Human Services, will soon appoint a special committee to advise her on medical, ethical and social issues surrounding xenotransplants. As the infrastructure grows, so does critics' frustration. The Campaign for Responsible Transplantation, the group pressing for a research ban, has lately been threatening to sue Shalala if she does not respond to its petition. ''The prospect of a global health pandemic doesn't seem to be concerning anybody,'' warns Alix Fano, the campaign's director. ''And the people that are voicing their concerns are either being silenced or ignored.''

For a freckle-faced 19-year-old named Robert Pennington, the issue is of more than academic interest. Exactly two years ago today, a Nextran pig saved his life. With a fake diamond stud in his left ear, a silver bracelet encircling his wrist and a scrawny tuft of reddish-brown hair decorating his chin, Pennington, clad in a black T-shirt and blue jeans, looks more like an up-and-coming rock star than someone who has been at the brink of death. The vast scar that creeps along his chest and abdomen, in the shape of an upside-down Y, tells a different story, one that began in the fall of 1997, in Garland, Tex., a suburb of Dallas where Pennington was reared by his paternal grandparents, Charlotte and Ray.

Pennington was working at a family-owned carpet store when he came down with what he thought was the flu. Three weeks later, still feeling poorly, he looked in the mirror and saw that the whites of his blue eyes had turned yellow. He went to a local medical clinic, where a doctor asked for a urine sample. When Pennington handed the cup back, he noticed the liquid inside was a coffee-colored brown.

The clinic doctor, mystified, sent him home with orders to come back in two weeks to see a specialist. Four days later, he was admitted to Baylor University Medical Center, in Dallas, with what Dr. Marlon Levy, a transplant surgeon there, describes as ''fulminate hepatic failure'' -- a sudden, overwhelming death of the liver. Without a transplant, Levy knew, the young man would be dead in a few days.

The liver's job is to clean toxins from the blood. When it stops working, ammonia and other poisons accumulate in the bloodstream and travel to the brain, which swells until the patient becomes comatose and dies. Within 24 hours of his arrival at Baylor, Pennington was showing signs of acute ammonia poisoning: hallucinations and aggression. At one point, nurses were forced to tie him to his bed. Charlotte Pennington, a gray-haired matronly woman with an abiding faith in God, was terrified. ''We were praying for him,'' she says. ''We told him to just rest and hold on to Jesus.''

Pennington was placed at the top of the transplant list, but there were no livers available. In the back of his mind, Levy was already weighing another option: a highly experimental procedure, ''extracorporeal perfusion,'' in which Pennington would be hooked up to a Nextran pig liver and his blood would be circulated through it. The idea was to use the pig liver outside the body as a bridge, in the hope that it would keep Pennington alive until a human liver could be found. The procedure had been approved by the F.D.A. for testing at Baylor. Pennington was the first candidate.

In the eight years he has been performing liver transplants at Baylor, Levy, a stocky man with slicked-down black hair and a boyish face, has watched more patients than he can remember die for lack of organs. Because of the liver's complex physiology, liver xenotransplants are a long way off; hearts or kidneys will probably be tested first. But the perfusion experiment offered Nextran a halfway step, a chance to see how the immune system responded when exposed to its organs. And it gave Levy a chance to help a patient. On Sept. 3, 1997, the first batch of Nextran pigs was trucked from Ohio to the Baylor campus.

On Oct. 2, Robert Pennington's condition took a turn for the worse. In a deep coma, and no longer able to eat or breathe on his own, he was placed on full life support. His grandmother remembers watching the sun go down that evening and wondering whether the boy she had reared practically from birth would be alive when it came up in the morning. That night at about 11, Levy called Charlotte Pennington, awakening her from a deep sleep for a hasty meeting in the intensive-care unit. They sat at Robert's bedside and talked about the pigs. In the blue spiral notebook in which she recorded her thoughts, Robert's frightened grandmother jotted these words: ''uncharted territory. Not done at Baylor before.'' Levy told her she would need to make a decision by 8 the next morning.

The following morning, a 15-week-old, 118-pound pig was readied for surgery in the simple brick building that houses Baylor's animal lab; while Levy removed the animal's liver, an anesthesiologist inserted a line of plastic tubing in Robert's neck. Later, a second line of tubing was inserted into his groin, and the two-pound pig liver, covered by a surgical towel, was brought to Robert's bedside. The perfusion officially began at 4:10 P.M.; Robert's blood was pumped first through a heater and an oxygenator, then through the liver and then back into his body, at the rate of two quarts per minute.

Levy could see right away that it was working. ''The liver had good color and texture,'' he says, ''and it was taking up oxygen from the bloodstream.'' It was still cleaning Robert's blood six and a half hours later when a human liver was found in Houston, 250 miles away. In her scrapbook, Charlotte Pennington keeps a snapshot of ''the pig that was sacrificed to save Robert,'' a Polaroid photograph given to her by one of Baylor's animal handlers, who had named the pig Sweetie Pie.

Three weeks later, the F.D.A. shut down the perfusion trial. A team of virologists in England, who had already reported that PERV could infect human cells in the test tube, had now documented two separate strains of the virus and discovered that the genes for both appeared in a wide variety of pigs, suggesting that it would be difficult to breed them out. ''We were very concerned,'' **says Dr. Philip Noguchi, the F.D.A. official who oversees xenotransplant research**. ''It was sufficiently worrisome that we felt it would be better to stop.''

- The Food and Drug Administration on Tuesday suspended 27 gene therapy trials -- nearly half of those now underway in the United States -- after the agency learned that a second French child had developed leukemia after receiving the promising, yet highly experimental, treatment.
- The agency had halted three trials in October following the revelation that one child had developed the potentially fatal form of cancer. The suspension was broadened Tuesday “because of unanswered questions about what is going on,” said Dr. Philip Noguchi, in charge of gene therapy issues at the FDA."

The ''clinical hold,'' which applied not only to Nextran but also to a number of other companies using live pig tissue in experiments, was lifted once the companies developed tests to screen both pigs and patients for evidence of PERV. While the tests indicate that the Nextran and Imutran herds showed no

evidence of active infection, Noguchi acknowledges that there are no guarantees. "We can only give assurance to the sensitivity of the assay as it currently stands," he says, lapsing into the kind of technotalk that bureaucrats use when they don't want to sound alarmist. In plain English: the virus may well be there; current tests may not be sensitive enough to detect it. Robert Pennington still undergoes regular tests for PERV infection; so far all have been negative.

When most Americans think of animal-to-human transplants, they remember the ill-fated 1984 attempt by Dr. Leonard Bailey, a Loma Linda, Calif., surgeon, to put a baboon heart in a baby the world came to know only as Fae. Baby Fae died after 20 days, but hers was only the most publicized of a long string of xenotransplant failures, starting with the earliest animal-to-human organ transplants at the beginning of the century. By 1985, the year after Baby Fae got her heart, many doctors had concluded that animals and humans were simply too dissimilar for cross-species transplants to work. In the Journal of the American Medical Association, Bailey was condemned for having succumbed to ''wishful thinking.''

Microbiology changed all that. While Bailey was being ridiculed in the popular press, scientists were perfecting the creation of transgenic mice for the study of cancer. By the late 1980's, companies like Nextran and Imutran were trying to figure out how to use transgenic technology for commercial gain. Pigs as organ donors seemed an obvious choice, but first the companies would have to understand the genetic underpinnings of a process known as ''hyperacute rejection,'' in which the human immune system rejects animal organs minutes to hours after transplant. Most immunologists, including Platt, of the Mayo Clinic, believe that the human complement system, a collection of proteins that attack and destroy foreign cells, is responsible for hyperacute rejection. In the early 1990's, Platt, then at Duke University, teamed up with Logan to introduce genes to suppress these proteins. In 1995, in a study that turned the xenotransplant world on its head, they reported their results: Nextran's pig hearts survived for as long as 30 hours inside baboons. The problem of hyperacute rejection, it seemed, could be solved. In England, Imutran was proceeding on a similar track.

"There was an amazing amount of excitement in the field," White, of Imutran, says. "Before that time, people measured the survival of organs transplanted from pigs to monkeys in minutes. And then you suddenly went from minutes to days. It doesn't seem very long, but it was an absolutely major breakthrough."

White sensed early on that this was the stuff of which scientific legends are made. In 1995, he boldly predicted that human experiments would begin within two years, a prediction that generated a backlash in England and spawned a spate of ethics reviews. And though it did not come true, he is not shy about tooting his own horn. "I always like to tell my story that the first transgenic pig was born in a stable on Christmas Eve," he says, only partly tongue-in-cheek. "It's a slight stretch," he says, "because, in fact, the first litter was born on the evening of the 23d but going over into midnight, on the 24th." He also had the presence of mind to give the animal a name: Astrid.

Nextran, on the other hand, gives its pigs numbers. "They still tell that story?" Logan asks, eyebrows raised. "The day before Christmas Astrid story?" He pauses a moment, then lets out a little sigh. "Well," he says finally, "I guess a good story endures."

Today, four years after their big breakthrough in hyperacute rejection, the companies are trying to understand other forms of rejection that prevent their organs from surviving for more than a few months in baboons. Regulators will not approve human experiments until the companies can demonstrate longer survival times; Noguchi, of the F.D.A., says some experts have called for a minimum of six months. **So far, Imutran has come closest; it has kept pig hearts alive in baboons for as long as 99 days, as opposed to 39 days for Nextran.** The difference is a sore point between the companies. Logan says that Imutran is using antirejection drugs in such high doses that a patient could die from a weakened immune system. White says Logan is wrong. Both men, however, say one thing is clear: victory in this race will be dictated as much by progress in the laboratory as by regulatory politics and concerns about public health.

"There's an old story in science," Logan says, "about climbing a hill. The question is, Once you get to the top of the hill, is it a whole series of mountains, or just this one hill? And you don't know until you get there. We are right at that stage, close to the top of the hill.

2019 (Dec 8/9) - New conference to explore innovative solutions to combat global health threat posed by Nipah virus

Inaugural Nipah virus conference convenes leading experts to strengthen global collaboration, improve efforts to combat deadly virus ; Source : [HI0026] [GDrive]

DUKE-NUS MEDICAL SCHOOL

Singapore, 09 December 2019 - The threat of infectious diseases, such as Nipah virus, spreading across borders has increased substantially as a result of the ease of global travel. Nipah virus experts and stakeholders gather at the first international conference to commemorate the 20th anniversary of the virus' discovery and to discuss innovative and effective solutions to combat the threat to global health security posed by Nipah virus.

Duke-NUS Medical School (Duke-NUS) and the Coalition for Epidemic Preparedness Innovations (CEPI) are co-hosting The Nipah Virus International Conference 2019 on December 9 and 10. The conference brings together Nipah experts and global health stakeholders to review past Nipah outbreaks, discuss the latest developments in diagnostics, vaccines and therapeutics, and foster greater international collaboration.

Guest-of-honour Dr Lam Pin Min, Senior Minister of State, Ministry of Transport and Ministry of Health, Singapore, will deliver the opening address. The conference guests include leaders and representatives from the Ministry of Health (Singapore), the World Health Organisation (WHO), Ministry of Health (Malaysia), the U.S. National Institutes of Health (NIH), Ministry of Social and Family Development (Singapore), Duke-NUS, CEPI, SingHealth and other key stakeholders from the healthcare and biomedical ecosystem in Singapore.

A growing threat to global health security

Nipah virus was first identified in 1999 during a large outbreak affecting Malaysia and Singapore. The virus is one of eight categories of diseases that the WHO has identified as epidemic threats in need of prioritisation. Over the past 20 years, the virus has continued to spread over thousands of kilometres to Bangladesh and India.

Nipah is a zoonotic virus, which means that it can be spread to humans from animals. It is spread primarily by bats (specifically Pteropus fruit bats) and pigs. It can also be transmitted through contaminated food and directly from person to person.

The virus causes severe disease, with recorded mortality rates in Malaysia, Bangladesh and India of between 40 and 90 percent. In 2001, the virus was detected in Bangladesh and since then, frequent outbreaks have occurred in the country. An outbreak in Kerala, India, in 2018 claimed 17 lives.

"There are currently no specific drugs or vaccines for Nipah virus infection, even though the WHO has identified Nipah as a priority disease for the WHO Research and Development Blueprint. Through the conference, we aim to stimulate dialogue between experts and stakeholders to bring about innovative and effective solutions to boost efforts in fighting Nipah virus," said Professor Wang Linfa, Director of Duke-NUS' Emerging Infectious Diseases Programme and Co-Chairman of the conference's organising committee.

With global travel being more prevalent than ever, infectious diseases, especially those that can be transmitted from animals to people, can be rapidly spread across borders. Therefore, it is crucial to strengthen outbreak preparedness and response against infectious diseases such as Nipah.

One of the ways the conference aims to achieve that is by facilitating interaction between clinicians, veterinarians, scientists and public health experts from the region and beyond. Discussions such as these would help enormously in the communication, cooperation and collaboration between animal and human public health agencies to ensure that Nipah never becomes a global pandemic.

"Outbreaks of Nipah virus have so far been confined to South and Southeast Asia, but the virus has serious epidemic potential, because Pteropus fruit bats that carry the virus are found throughout the tropics and sub-tropics, which are home to more than two billion people. Nipah virus can also be transmitted from person to person, so in theory it could spread into densely populated temperate areas too," said Richard Hatchett, CEO of CEPI.

"Twenty years have passed since its discovery, but the world is still not adequately equipped to tackle the global health threat posed by Nipah virus. This needs to change. Strengthening collaboration and knowledge sharing between Nipah virus experts, industry and key public-health stakeholders is crucial to the development of novel interventions against Nipah. As a co-host of the Nipah Virus International Conference 2019, CEPI is pleased to be able to foster such global collaboration," he added.

WHO and the National Institute of Allergy and Infectious Diseases, one of the U.S. National Institutes of Health, are also key sponsors of this conference.

Hideyo Noguchi (野口 英世, Noguchi Hideyo, November 9, 1876 – May 21, 1928), also known as Seisaku Noguchi (野口 清作, Noguchi Seisaku), was a prominent Japanese bacteriologist who in 1911 discovered the agent of syphilis as the cause of progressive paralytic disease.

Early life[edit]

Noguchi Hideyo whose childhood name was Seisaku Noguchi[1] was born to a family of farmers for generations[1] in Inawashiro, Fukushima prefecture in 1876. When he was one and a half years old, he fell into a fireplace and suffered a burn injury on his left hand. There was no doctor in the small village, but one of the men examined the boy. "The fingers of the left hand are mostly gone," he said, "and the left arm, the left foot, and the right hand are burned; I don't know how badly."[2]

[...]

In 1883, Noguchi entered Mitsuwa elementary school. Thanks to generous contributions from his teacher Kobayashi and his friends, he was able to receive surgery on his badly burned hand. He recovered about 70% mobility and functionality in his left hand through the operation.

Noguchi decided to become a doctor to help those in need. He apprenticed himself to Dr. Kanae Watanabe (渡部 鼎, Watanabe Kanae), the same doctor who had performed the surgery. He entered Saisei Gakusha, which later became Nippon Medical School. He passed the examinations to practice medicine when he was twenty years old in 1897. He showed signs of great talent and was supported in his studies by Dr. Morinosuke Chiwaki. In 1898, he changed his first name to Hideyo after reading a Tsubouchi Shōyō novel of college students whose character had the same name—Seisaku—as him. The character in the story was an intelligent medical student like Noguchi but became lazy and ruined his life.[3]

Career[edit]

In 1900 Noguchi travelled on the America Maru to the United States, where he obtained a job as a research assistant with Dr. Simon Flexner at the University of Pennsylvania and later at the Rockefeller Institute of Medical Research. He thrived in this environment.[4] At this time his work concerned venomous snakes. In part, his move was motivated by difficulties in obtaining a medical position in Japan, as prospective employers were concerned that his hand deformity would discourage potential patients. In a research setting, he did not have a handicap. He and his peers learned from their work and from each other. In this period, a fellow research assistant in Flexner's lab was Frenchman Alexis Carrel, who would go on to win a Nobel Prize in 1912.[5]

Noguchi's work later attracted the Prize committee's scrutiny.[6] In the 21st century, the Nobel Foundation archives were opened for public inspection and research. Historians found that Noguchi was nominated several times for the Nobel Prize in Physiology or Medicine: in 1913–1915, 1920, 1921 and 1924–1927.[7] During the 1920s, his work was being increasingly criticized for inaccuracies.[citation needed]

While working at the Rockefeller Institute of Medical Research in 1911, he was accused of inoculating orphan children with syphilis in the course of a clinical study.[8] He was acquitted of any wrongdoing at the time but, since the late 20th century, his conduct of the study has come to be considered an early instance of unethical human experimentation. At the time, society had not developed a consensus about how to conduct human experimentation and feelings varied about the medical research community. Antivivisectionists linked their concerns for animals with concerns about humans.[9] The American Society for the Prevention of Cruelty to Children was founded in the late 19th century after the American Society for the Prevention of Cruelty to Animals.

In 1913, Noguchi demonstrated the presence of Treponema pallidum (syphilitic spirochete) in the brain of a progressive paralysis patient, proving that the spirochete was the cause of the disease.[10] Dr. Noguchi's name is remembered in the binomial attached to another spirochete, Leptospira noguchii.[11]

In 1918, Noguchi traveled extensively in Central America and South America working with the International Health Board to conduct research to develop a vaccine for yellow fever, and to research Oroya fever, poliomyelitis and trachoma. He believed that yellow fever was caused by spirochaete bacteria instead of a virus. He worked for much of the next ten years trying to prove this theory. His work on yellow fever was widely criticized as taking an inaccurate approach that was contradictory to contemporary research, and confusing yellow fever with other pathogens. In 1927-28 three different papers appeared in medical journals that discredited his theories.[12] It turned out he had confused yellow fever with leptospirosis. The vaccine he developed against "yellow fever" was successfully used to treat the latter disease.

Human experimentation scandal[edit]

In 1911 and 1912 at the Rockefeller Institute in New York City, Noguchi was working to develop a syphilis skin test similar to the tuberculin skin test. The subjects were recruited from clinics and hospitals in New York. In the experiment, Noguchi injected an extract of syphilis, called luetin, under the subjects' upper arm skin. Skin reactions were studied, as they varied among healthy subjects and syphilis patients, based on the disease's stage and its treatment. Of the 571 subjects, 315 had syphilis. The remaining subjects were "controls;" they were orphans or hospital patients who did not have syphilis. The hospital patients were already being treated for various non-syphilitic diseases, such as malaria, leprosy, tuberculosis, and pneumonia. Finally, the controls were normal individuals, mostly children between the ages of 2 and 18 years.[13] Critics at the time, mainly from the anti-vivisectionist movement, noted that

Noguchi violated the rights of vulnerable orphans and hospital patients. There was concern on the part of anti-vivisectionists that the children would get syphilis from Noguchi's experiments.[14][15]

It became a public scandal and the media discussed it. The editor of Life pointed out:

If the researcher had said to these patients: "Have I your permission to inject into your system a concoction more or less related to a hideous disease?"—the invalids might have declined.[16]

In Noguchi's defense, Rockefeller Institute business manager Jerome D. Greene wrote a letter to the anti-vivisection society, which had protested the experiment. Greene pointed out that Noguchi had tested the extract on himself before administering it to subjects, and his fellow researchers had done the same, so it was impossible that the injections could cause syphilis. However, Noguchi himself was diagnosed with untreated syphilis in 1913, for which he refused treatment from Rockefeller Hospital.[15] At the time, Greene's explanation was considered a demonstration of the importance of the studies and care the doctors were taking in research. In May 1912 the New York Society for the Prevention for Cruelty to Children asked the New York district attorney to press charges against Noguchi; he declined.[17]

In the United States, it was not until the late 20th century that sufficient consensus developed about human experimentation to gain passage of laws to protect subjects. Along the way, more protocols were developed about informed consent and rights of patients/subjects.[15]

Death[edit]

Following the death of British pathologist [**Prof. Adrian Stokes (born 1887)**] of yellow fever in **September 1927**,[18] it became increasingly evident that yellow fever was caused by a virus, not by the bacillus Leptospira icteroides, as Noguchi believed.[citation needed]

Feeling his reputation was at stake, Noguchi hastened to Lagos to carry out additional research. However, he found the working conditions in Lagos did not suit him. At the invitation of Dr. William Alexander Young, the young director of the British Medical Research Institute, Accra, Gold Coast (modern-day Ghana), he moved to Accra and made this his base in 1927.

However, Noguchi proved a very difficult guest and by May 1928 Young regretted his invitation. Noguchi was secretive and volatile, working almost entirely at night to avoid contact with fellow researchers. The diaries of Oskar Klotz, another researcher with the Rockefeller Foundation,[19] describe Noguchi's temper and behavior as erratic and bordering on the paranoid. His methods were haphazard.

According to Klotz, he inoculated huge numbers of monkeys with yellow fever, but failed to keep proper records. He may have believed himself immune to yellow fever, having been inoculated with a vaccine of his own development. Possibly his erratic and irresponsible behavior was caused by the untreated syphilis with which he was diagnosed in 1913, and which may have progressed to neurosyphilis.[citation needed]

Despite repeated promises to Young, Noguchi failed to keep infected mosquitoes in their specially designed secure housing. In May 1928, having failed to find evidence for his theories, Noguchi was set to return to New York, but was taken ill in Lagos.

He boarded his ship to sail home, but on 12 May was put ashore at Accra and taken to a hospital with yellow fever. After lingering for some days, he died on 21 May.[20]

In a letter home, Young states, "He died suddenly noon Monday. I saw him Sunday afternoon – he smiled – and amongst other things, said, “Are you sure you are quite well?" "Quite." I said, and then he said "I don’t understand."[21]

Seven days later, despite exhaustive sterilisation of the site and most particularly of Noguchi's laboratory, Young himself died of yellow fever.[citation needed]

Legacy[edit]

Statue of Hideyo Noguchi in Ueno Park

Hideyo Noguchi Memorial Museum

While Noguchi was influential during his lifetime, later research was not able to reproduce many of his claims, including having discovered the causes of polio, rabies, syphilis, trachoma, and yellow fever.[22] His finding that Noguchia granulosis causes trachoma was questioned within a year of his death, and overturned shortly thereafter.[23][24] His identification of the rabies pathogen was wrong,[25] because the medium he invented to cultivate bacteria was seriously prone to contamination.[26] A fellow Rockefeller Institute researcher said that Noguchi "knew nothing about the pathology of yellow fever" and criticized him for being unwilling to issue retractions for false claims, saying, "I don't think that Noguchi was an honest scientist".[27] Noguchi's failures have often been attributed to his tendency to work in isolation without the skeptical eye of fellow researchers.[12][28] What are considered flaws in the Rockefeller Institute's system of peer review is also a frequent subject of criticism.[29]

Noguchi's most famous contribution is his identification of the causative agent of syphilis (the bacteria Treponema pallidum) in the brain tissues of patients suffering from partial paralysis due to meningoencephalitis. Other lasting contributions include the use of snake venom in serums, the identification of the leishmaniasis pathogen and of Carrion's disease with Oroya fever. His claim to have grown a culture of syphilis has proven irreproducible.[30]

Honors during Noguchi's lifetime[edit]

Noguchi was honored with Japanese and foreign decorations. He received honorary degrees from a number of universities.

He was self-effacing in his public life, and he often referred to himself as "funny Noguchi." Those who knew him well said that he "gloated in honors."[31] When Noguchi was awarded an honorary doctorate at Yale, William Lyon Phelps observed that the kings of Spain, Denmark and Sweden had conferred awards, but "perhaps he appreciates even more than royal honors the admiration and the gratitude of the people."[32]

- Kyoto Imperial University, Doctor of Medicine, 1909.[33]
- Knight of the Order of Dannebrog, 1913 (Denmark).[34]
- Commander of the Order of Isabella the Catholic, 1913 (Spain).[35]
- Commander of the Order of the Polar Star, 1914 (Sweden).[36]
- Tokyo Imperial University, Doctor of Science, 1914.[36]
- Order of the Rising Sun, Gold Rays with Rosette, 1915.[37]
- Imperial Award, Imperial Academy (Japan), 1915.[38]
- Central University of Ecuador, 1919, (Ecuador).[39]
- National University of San Marcos, 1920, (Peru)
- Medicine School of Merida, "Doctor Honoris Causa en Medicina y Cirugía", 1920 (México)
- University of Guayaquil, 1919, Ecuador.[39]
- Yale University, 1921, (United States).[32]
- Knight of the Legion of Honour of France, 1924[40]
- Senior fifth rank in the order of precedence, Japanese government, 1925[40]

Posthumous honors[edit]

Hideyo Noguchi on the ¥1,000 banknote

The grave of Hideyo Noguchi in Woodlawn Cemetery

Noguchi's remains were returned to the United States and buried in Woodlawn Cemetery in the Bronx, New York City.[41]

In 1928, the Japanese government awarded Noguchi the Order of the Rising Sun, Gold and Silver Star, which represents the second highest of eight classes associated with the award.[42]

In 1979, the Noguchi Memorial Institute of Medical Research (NMIMR) was founded with funds donated by the Japanese government[43] at the University of Ghana in Legon, a suburb north of Accra.[44]

In 1981, the Instituto Nacional de Salud Mental (National Institute of Mental Health) "Honorio Delgado - Hideyo Noguchi" was founded with founds of the Peruvian Government and the JICA (Japan International Cooperation Agency) in Lima - Perú.[45]

Dr. Noguchi's portrait has been printed on Japanese 1000-yen banknotes since 2004.[46] In addition, the house near Inawashiro where he was born and brought up is preserved. It is operated as part of a museum to his life and achievements.

Noguchi's name is honored at the Centro de Investigaciones Regionales Dr. Hideyo Noguchi at the Universidad Autónoma de Yucatán.[47]

A 2.1 km street in Guayaquil, Ecuador downtown is named after Dr. Hideyo Noguchi.

Hideyo Noguchi Africa Prize[edit]

The footstone of Hideyo Noguchi in Woodlawn Cemetery, New York City

The Japanese Government established the Hideyo Noguchi Africa Prize in July 2006 as a new international medical research and services award to mark the official visit by Prime Minister Jun'ichirō Koizumi to Africa in May 2006 and the 80th anniversary of Dr. Noguchi's death.[48] The Prize is awarded to individuals with outstanding achievements in combating various infectious diseases in Africa or in establishing innovative medical service systems.[49] The presentation ceremony and laureate lectures coincided with the Fourth Tokyo International Conference on African Development in late April 2008.[50] In 2009, the conference venue was moved from Tokyo to Yokohama as another way of honoring the man after whom the prize was named. In 1899, Dr. Noguchi worked at the Yokohama Port Quarantine Office as an assistant quarantine doctor.[51]

The Prize is expected to be awarded every five years.[52] The prize has been made possible through a combination of government funding and private donations.[53]

Saved Wikipedia (March 19, 2021) for "Ira Nowinski"

Source : [HK0063][GDrive]

Ira Nowinski is a photographer. Nowinski earned a Master of Fine Art's degree from the San Francisco Art Institute in 1973. From the late 1970s through the early 1980s, Nowinski served as the official photographer of the San Francisco Opera.[1] His photographs have been collected extensively by the University of California, Berkeley's Bancroft Library; Stanford University Libraries' Department of Special Collections; Bibliothèque Nationale in Paris; the Museum of Modern Art, New York, and the National Museum of Photography, Bradford, England.[2][3]

He has worked on three major photographic projects documenting various aspects of the Jewish experience in the 20th Century: *In Fitting Memory: The Art and Politics of Holocaust Memorials*; *Karaite Jews in Egypt, Israel, and the San Francisco Bay Area*; and *Soviet Jews in San Francisco.* [4]

His current projects include a photographic exploration of the Galapagos Islands.[3]

He has had major exhibitions of his photography at the Stanford University Libraries' Peterson Gallery in 2004[1] and the Judah L. Magnes Museum in 2007.[2]

Biography[edit]

Ira Nowinski, an American photographer of Polish and Hungarian Jewish descent, was born in 1942 in New York City and raised in New Rochelle, NY. At the age of 42, he was prodded by opera singer Regina Resnick to do a photo essay around the Jewish milieu. He had previously done photo essays of the North Beach, San Francisco, area, of the evacuation of elderly citizens from hotels in the South of Market area of San Francisco, and of the Southeast Asian Community in the same city. In addition, he had been the staff photographer of the San Francisco Opera since 1978.[5][*failed verification*]

Working first with Resnick and then with Seymour Fromer of the Judah L. Magnes Museum, Rhonda Abrams of the Anti-Defamation League, Anita Friedman

of Jewish Family & Children's Services, and the Northern California Board of Rabbis, Nowinski began documenting the Jewish experience in the San Francisco Bay Area. One of his first projects was to document Soviet Jews who had immigrated during the 1970s and 1980s.[5][*failed verification*]

He also photographed the Karaite Jewish Community in Foster City. The Karaites were a Jewish community that had lived for nearly 500 years in Egypt. The Arab-Israeli war resulted in the expulsion of the Jews from Egypt at the conclusion of that conflict. Many subsequently immigrated first to Israel and then to Northern California. Nowinski retraced their migration route in reverse, first photographing Karaites in Foster City, California, then in Israel, and finally in Egypt.[5][*failed verification*]

Nowinski and Sybil Milton of the U.S. Holocaust Museum did a joint work on the Holocaust Memorials throughout Europe, Israel, and in the United States. This work, entitled "In fitting memory : the art and politics of Holocaust memorials" combined text provided by Milton with Nowinski's photographic essay of the monuments documenting the millions of Jews who lost their lives under the Nazi regime.[5][*failed verification*]

Robert Nowinski bio, from Google Sites (2013 March 18 capture)

Source : [HW0063][GDrive]

Dr. Robert Nowinski has founded six biotechnology companies. He subsequently brought four of these companies public through an IPO financing. He was the first employee in each company and also held the executive position(s) of CEO and/or the Chairman of the Board. In each business he set the direction, acquired the initial technology, recruited key management and provided oversight for the research programs. Dr. Robert Nowinski also conducted private and public financings of up to $130 million for each company.

Three of the public companies have been acquired by major pharmaceutical companies; Genetic Systems in 1987 for $310 million by Bristol-Myers; PathoGenesis in 2000 for $660 million by Chiron/Novartis; and Icos in 2006 for $2.2 billion by Eli Lilly. The fourth public company, [**VaxGen, Incorporated**], is traded on NASDAQ. Collectively, these companies have developed and marketed eight diagnostic tests and two therapeutic drugs with annual sales exceeding $2.0 billion.

Robert Nowinski received his Ph.D. in immunology from the Sloan-Kettering Institute in 1971. From 1971 to 1975 he was an assistant professor of oncology at the University of Wisconsin. **From 1975 through 1981, he was an associate professor of microbiology and immunology at the University of Washington.** He also was a founding scientist and head of the Virology Program of the Fred Hutchinson Cancer Research Center in Seattle. From 1981 through 1982, Robert Nowinski was a professor of microbiology at the UW and a member of the FHCRC. His academic research concerned cancer-causing retroviruses, as well as antibody treatments for cancer and antibodies for the diagnosis of sexually-transmitted diseases.

In 1981, Dr. Robert Nowinski began a second career in the biotechnology industry when he founded Genetic Systems Corp. in Seattle. Genetic Systems conducted an IPO financing within one month of its formation. The company developed diagnostic products and treatments for infectious diseases and cancer. From 1981 through 1985,Robert Nowinski was the company's chairman and CEO.

Genetic Systems developed the first rapid test for Chlamydia, the most prevalent sexually-transmitted disease in humans. This test decreased the average time of diagnosis from 21 days to 45 minutes, lowered the cost of diagnosis from $150 to $4.50 and expanded the U.S. market from 150,000 tests per year to an estimated 20 million. In collaboration with the Institut Pasteur, Genetic Systems then developed the most accurate blood test for HIV within the first generation of HIV diagnostics.

In 1983, within the structure of Genetic Systems, Dr. Robert Nowinski founded the subsidiary Oncogen LP, dedicated solely to cancer diagnostics. Oncogen, located in the Genetic Systems Building, was co-owned and solely financed by Syntex Corp. In 1985, Genetic Systems and Syntex each sold one-third of their interests to Bristol-Myers Corp. and the mandate of Oncogen was expanded to include cancer therapeutics

In 1986, Dr. Robert Nowinski initiated and managed the merger of Genetic Systems and Oncogen LP into Bristol-Myers through a pooling of interests valued at $310 million. Dr. Robert Nowinski was appointed corporate vice president for New Technology at Bristol-Myers and chairman of the new Genetic Systems Division. At that time he relocated from Seattle to the corporate headquarters of Bristol-Myers in New York.

In 1989, Dr. Robert Nowinski returned to Seattle and founded Icos Corp. Dr. Robert Nowinski served as CEO of Icos from 1989 to 1991. In 1991, he brought Icos public. The company focused on inflammation and novel methods for drug discovery. Icos developed the drug Cialis for treating erectile dysfunction. Eli Lilly markets Cialis, with annual sales exceeding $1.2 billion. In 2006, Icos was acquired by E. Lilly for $2.2 billion.

In 1992, Dr. Robert Nowinski founded PathoGenesis. The company focused on the cause and treatment of chronic illnesses. Dr. Robert Nowinski served as chairman of PathoGenesis from 1992 to 1995 and as chairman emeritus for several years thereafter. In 1993, he brought PathoGenesis public. In 1997, PathoGenesis received FDA approval to market an aerosolized form of tobramycin, or TOBI, for treating cystic fibrosis. In addition, research within PathoGenesis identified HerpesVirus 6 as a primary causative agent of multiple sclerosis. In August 2000, PathoGenesis was acquired by Chiron Corp. for $660 million. TOBI is now the leading treatment for cystic fibrosis; annual sales exceed $600 million. Chiron was subsequently acquired by Novartis.

In 1995, Dr. Robert Nowinski founded [**VaxGen, Incorporated**]. VaxGen develops preventive vaccines for infectious diseases. He served as VaxGen's chairman and CEO until 2000. Dr. Robert Nowinski brought VaxGen public in 1998. [**VaxGen, Incorporated**] completed the first Phase 3 trial of an HIV vaccine, or AIDSVAX. AIDSVAX was tested in 8,500 volunteers on three continents. The trial, completed in January 2003, reported that the vaccine was ineffective. Although 100% of vaccine-recipients developed antibodies, the rate of HIV infection was similar in the vaccinated and placebo groups. VaxGen has since developed vaccines against anthrax and smallpox.

In 2000, Dr. Robert Nowinski founded and became chairman and CEO of Primal Inc. Primal, based in Seattle, develops products for behavioral disorders, including those that address disorders in appetite, sexuality, mood, pain and addiction. The company focuses on gene knock-out technology in mice and the biology of G-protein coupled receptors (GPCRs), the targets for over 45% of today's pharmaceuticals. Primal was co-founded with Dr. Linda Buck, the winner of the 2005 Nobel Prize for Medicine. Primal was the first to describe the full complement of 475 GPCR genes in humans and has within its patent portfolio claims for the entire family of GPCRs as potential drug targets. Primal is currently in the business of developing new drugs to GPCRs.

In 2008, Dr. Robert Nowinski moved to New York and founded ContraFect Corporation.

Founder of "**PathoGenesis Corp**"

Source : [HW0062][GDrive] : "***Brown, previously at Bristol-Myers Squibb in Seattle, in 1992 became PathoGenesis Corp.'s first employee after founder [Dr. Robert Charles Nowinski (born 1945)].*** *Burmer was the first program director at PathoGenesis, and managed its pathogen discovery program.* "

Was it all about Pathogenic Priming? This has been considered risky - https://pubmed.ncbi.nlm.nih.gov/32292901/

"**Abstract**

Homology between human and viral proteins is an established factor in viral- or vaccine-induced autoimmunity. Failure of SARS and MERS vaccines in animal trials involved pathogenesis consistent with an immunological priming that could involve autoimmunity in lung tissues due to previous exposure to the SARS and MERS spike protein. Exposure pathogenesis to SARS-CoV-2 in COVID-19 likely will lead to similar outcomes. Immunogenic peptides in viruses or bacteria that match human proteins are good candidates for pathogenic priming peptides (similar to the more diffuse idea of "immune enhancement"). Here I provide an assessment of potential for human **pathogenesis** via autoimmunity via exposure, via infection or injection. SAR-CoV-2 spike proteins, and all other SARS-CoV-2 proteins, immunogenic epitopes in each SARS-CoV-2 protein were compared to human proteins in search of high local homologous matching. Only one immunogenic epitope in a SARS-CoV-2 had no homology to human proteins. If all of the parts of the epitopes that are homologous to human proteins are excluded from consideration due to risk of pathogenic priming, the remaining immunogenic parts of the epitopes may be still immunogenic and remain as potentially viable candidates for vaccine development. Mapping of the genes encoding human protein matches to pathways point to targets that could explain the observed presentation of symptoms in COVID-19 disease. It also strongly points to a large number of opportunities for expected disturbances in the immune system itself, targeting elements of MHC Class I and Class II antigen presentation, PD-1 signaling, cross-presentation of soluble exogenous antigens and the ER-Phagosome pathway. Translational consequences of these findings are explored.

Keywords: Autoimmunity; COVID-19; Immune Enhancement; Pathogenic priming; SARS-CoV-2."

HERALD STATESMAN, YONKERS, N.Y., THURSDAY, JANUARY 24, 1963

6 County Students Win Talent Search Honors

WASHINGTON — Six Westchester, N.Y., students are among the 237 who have won a place in the honors group of the 22nd Science Talent Search it was announced today.

Among them is John W. Glendening 3d, 17, of Pelham Memorial High School, who was the senior boys champion of the 1962 Westchester Science and Engineering Fair in the County Center, White Plains. He is working on a project for the eighth Westchester fair next March 21 and 22 in the center.

The other five, all 17 years of age, are Richard W. Young of Hartsdale, a student in White Plains High School whose subject was "Removal of Radioactive Strontium from Milk," and four New Rochelle High School students, Lawrence C. Libman, "Determination of Optimal pH of Alpha Amylase Activity," Robert C. Nowinski, "Transfer of Specific Tissue Immunity to Newborn Rats with Immune Cell Transplants," David S. Pisetsky, "Determining Role of Cell Wall in Growth and Adsorption of Bacteriophages," and Daniel P. Serwer, "Thermochromism of the Inorganic Oxides."

Glendening's topic was "Electroluminescence," the project which won him the Westchester championship and a top to the National Science Fair in Seattle, Wash., last May. He has been admitted to the Massachusetts Institute of Technology, and will enter there in the fall.

Of the total honors group, 76 are girls and 251 boys. Of the honors group, 66 per cent of the boys and 72 per cent of the girls rank in the upper five per cent in their high school classes. Of the total, 279 belong to science clubs of which 199 are affiliated with the Science Clubs of America.

A total of 3,274 students completed all entry requirements and were qualified for judging in the Science Talent Search.

On Jan. 30, 40 members of the honors group will be announced as the top winners of the Science Talent Search and will be invited to Washington for a five-day Science Talent Institute Feb. 27-March 4, during which they will be judged for $34,250 in Westinghouse science scholarships and awards.

First choice of careers in the honors group is the medical sciences.

Theme

When Dorothy was flung into the land of Oz from the back of a wild tornado, she was confronted with a totally new and strange environment. Behind her lay the warm security of her home in Kansas. Ahead of her lay a vast ocean of uncertainty which would require courage and fortitude to cross. But Dorothy didn't waver. She boldly faced each new obstacle with a strong spirit of adventure. She made many new friends, three of whom were especially very close to her. From these three, Dorothy gained priceless wisdom.

The cowardly lion taught her that courage lies deep in every heart and springs forth in times of crises. The tin man taught her that love is a spontaneous and not a manufactured emotion. But the scarecrow taught her the most sacred of all lessons. Knowledge is the key to life and success, and education is the source of that key.

Our graduation from New Rochelle High is parallel to Dorothy's travels. We both started off with wise counsel, skillful guidance. It remains up to the individual how he will face his personal "Yellow Brick Road." Will we falter and grow weary or will we find the strength to face the trials ahead. . . . .

Abstract

IMP:pyrophosphate phosphoribosyltransferase (IPPase) (EC 2.4.2.8) has been purified over 7000-fold from human erythrocytes. The purified enzyme moved as a single band on disc electrophoresis. Antisera prepared in rabbits and rats against the purified enzyme precipitated and neutralized the enzyme, but had no effect on AMP-pyrophosphate phosphoribosyltransferase (EC 2.4.2.7) activity. Evidence was found for isozymes (enzyme variants) of IPPase in normal erythrocytes.

Erythrocyte lysates of five patients with Lesch-Nyhan disease reacted with antisera against normal IPPase. Lysates from LN erythrocytes blocked the inactivation of normal enzyme by the antibody. LN erythrocytes had about the same concentration of enzyme protein as normal erythrocytes.

The genetic defect in LN results in the production of essentially normal amounts of an immunologically identifiable but catalytically incompetent enzyme. Thus LN is apparently the result of a mutation in a structural gene and is not due to deletion of a structural gene or defect in a regulatory gene.

DOI: 10.1073/pnas.68.7.1608 PMID: 4997759 PMCID: PMC389251

Abstract

We describe here serological and structural properties of a virus, Mason-Pfizer Monkey Virus (M-PMV), isolated from a simian mammary tumor. This virus is morphologically similar to the known oncogenic RNA viruses (oncornaviruses). It has a 60-70S RNA, and its replication is inhibited by actinomycin. Antisera prepared against the virus isolated by density-gradient centrifugation identify at least two viral structural antigens. Immunodiffusion studies show that this virus is serologically unrelated to three types of simian foamy viruses, visna virus, and the known oncornaviruses. Immunofluorescence reveals that the structural proteins of the virus are synthesized cytoplasmically. Although M-PMV productively infects human cells in vitro, serological analysis does not show the presence of M-PMV antigens in human neoplasia.

TOXICITY BIBLIOGRAPHY

A bibliography covering reports on toxicity studies, adverse drug reactions, and poisoning in man and animals.

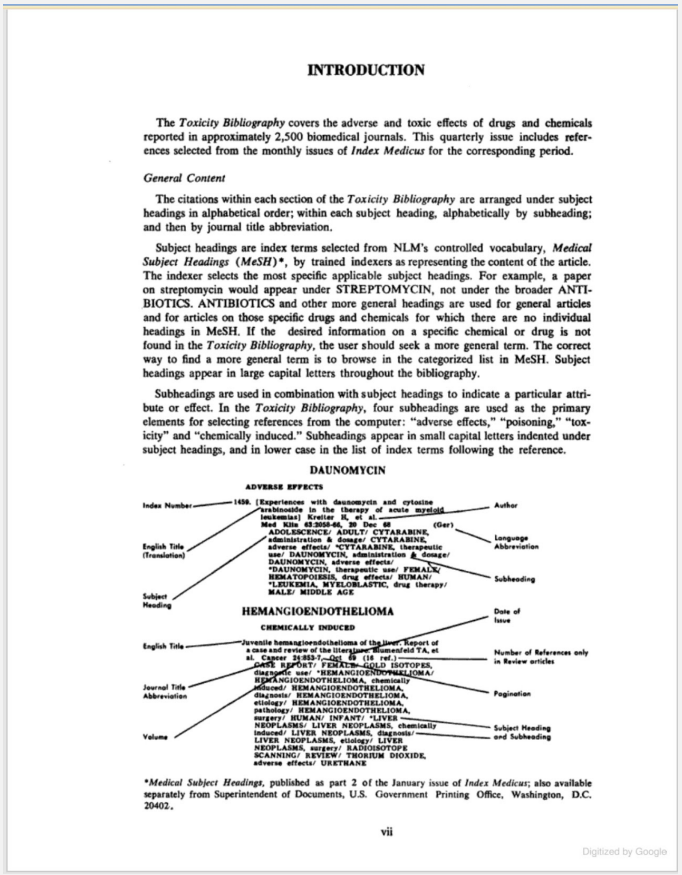
ISSN: 0041-0071

Volume 10, Number 2

April-June 1977

Digitized by Google

[HG00C1][GDrive]



INTRODUCTION

The *Toxicity Bibliography* covers the adverse and toxic effects of drugs and chemicals reported in approximately 2,500 biomedical journals. This quarterly issue includes references selected from the monthly issues of *Index Medicus* for the corresponding period.

General Content

The citations within each section of the *Toxicity Bibliography* are arranged under subject headings in alphabetical order; within each subject heading, alphabetically by subheading; and then by journal title abbreviation.

Subject headings are index terms selected from NLM's controlled vocabulary, *Medical Subject Headings (MeSH)**, by trained indexers as representing the content of the article. The indexer selects the most specific applicable subject headings. For example, a paper on streptomycin would appear under STREPTOMYCIN, not under the broader ANTIBIOTICS. ANTIBIOTICS and other more general headings are used for general articles and for articles on those specific drugs and chemicals for which there are no individual headings in MeSH. If the desired information on a specific chemical or drug is not found in the *Toxicity Bibliography*, the user should seek a more general term. The correct way to find a more general term is to browse in the categorized list in MeSH. Subject headings appear in large capital letters throughout the bibliography.

Subheadings are used in combination with subject headings to indicate a particular attribute or effect. In the *Toxicity Bibliography*, four subheadings are used as the primary elements for selecting references from the computer: "adverse effects," "poisoning," "toxicity" and "chemically induced." Subheadings appear in small capital letters indented under subject headings, and in lower case in the list of index terms following the reference.

DAUNOMYCIN

ADVERSE EFFECTS

UW Researchers Identify Leukemia Controls

MADISON — Researchers at the University of Wisconsin-Madison have identified several genetic controls in animals which either inhibit or encourage the spread of leukemia, a cancer believed caused by a hereditary virus.

Leukemia, a cancer of the blood which strikes both young and old, is the most common form of the disease among children. Optimistic estimates project that a child will live about five years after developing leukemia.

Dr. Robert C. Nowinski of the McArdle Laboratory, the midwest's largest cancer research center, believes these genetic mechanisms help control leukemia-causing viruses in mice and account for the rarity of the disease. Without these controls, every animal might be expected to develop leukemia.

"This virus has been found in virtually every animal species adequately studied from snake to gibbon ape," he explained. "Other studies have clearly shown that leukemia in lower animals is caused by a distinctive virus. Though a specific virus has yet to be found in man, there is little reason to assume that man is the only animal skipped by such a virus. If such a virus does exist in man, it is quite likely that similar types of genetic controls would be present."

In laboratory studies with mice, investigators identified 10 to 12 genes which determine whether a mouse will develop leukemia. In each cell of the body, several genes serve as gatekeepers at each of three levels which involves production of the leukemia virus.

Other genes control the virus's spread to other cells and the body's immunity. If the virus moves successfully through all five levels, leukemia may result.

Leukemia-causing viruses are as much a part of an animal's heritage as its hair color and are passed from parent to child at time of conception as just one more piece of genetic information, Dr. Nowinski said.

If only one gene were responsible for blocking the cancer, leukemia would be more common, and it would be easy to predict genetic susceptibility or resistance.

Since several genes are involved, it is unlikely that every one will be working appropriately at just the right time to produce the ideal conditions for leukemia growth and spread. This interaction makes it almost impossible to predict who will develop leukemia.

Dr. Nowinski expects to find additional genes involved as his study progresses.

Genes are elements found in the chromosomes of every cell which transmit hereditary characteristics. Each cell contains millions of genes, each too small to be seen under a microscope.

Leukemia is believed hereditary for several reasons. First, when one identical twin develops leukemia, the other twin will most likely have the disease. Second, some cancers such as breast cancer have a slight tendency to occur in the same family. Third, by modern techniques, it is possible to show the presence of leukemia virus genes in the chromosomes of lower animals.

The natives of the Caribbean island of Aruba speak Papiamento, often referred to as the "laughing language" because of the shape of the mouth when it is spoken.

UW prof wins research grant

MADISON, Wis. (UPI) — Robert Nowinski, an assistant professor of ecology at the University of Wisconsin, Wednesday was declared winner of the 10th grant for cancer research from the Fred Hutchinson Cancer Foundation.

Nowinski, 28, already has had 27 papers published on cancer research. He received a BS Degree from Beloit in 1967 and a Ph.D. degree from Cornell's Sloan Kettering division in 1971. The $1,500 cash grant from the Hutch Fund, comprised of major league baseball writers and broadcasters, will be presented by Hall of Fame member Lou Boudreau at a date to be selected.

Nowinski
Lecture-seminar course concerning host viral-interactions. Immunological and genetic approaches are emphasized. Prerequisite: permission. (Offered alternate years; offered 1975-76.)

MICRO 550 Selected Topics in Immunology (2, max. 18) ASp
Hellstrom, Pearsall, Weiser
Formal seminar-discussion course for advanced students focused on recent developments in the field of immunology and consisting of literature research and intensive in-depth study of important and timely topics. Three-hour seminars semimonthly and a comprehensive final examination. Prerequisites: 441, 442, or equivalent, and permission.

MICRO 553 Pathogenesis of Infectious Diseases of Man (4) W
Weiser
Discussion course focusing on the pathogenesis of infectious diseases, with emphasis on bacterial and mycotic infections of man in which selected models of important diseases are used to explore the biochemical, physiological, and immunological bases of the host-parasite interactions that govern host injury, development of lesions, and the course of disease. Prerequisites: 441, 442 or HUBIO 521P, PATH 444 or HUBIO 520P, BIOC 405 or HUBIO 521P and permission. (Offered alternate years; offered 1975-76.)

MICRO 555 Advanced Clinical Microbiology (2½) AWSp
Coyle, Schoenknecht, Sherris

MICRO 600 Independent Study or Research (*) AWSpS

MICRO 700 Master's Thesis (*) AWSpS

MICRO 800 Doctoral Dissertation (*) AWSpS

NEUROLOGICAL SURGERY

Courses numbered with a "P" suffix are not graduate courses and are restricted to medical student enrollment only.

NR 498 Undergraduate Thesis (*) AWSpS
G. Ojemann
Prerequisite: permission.

NR 499 Undergraduate Research (*) AWSpS
G. Ojemann
Investigation of special problems as an intimate member of the research team in the neurological surgery laboratories. Research to lead to a thesis, if desired. List of projects available on request. Prerequisite: permission.

NR 528P Neurological Surgery Seminar (1) AWSpS
Calvin
Weekly seminar centered around neurological research topics with discussion by staff and students. Prerequisite: HUBIO 532P or permission.

NR 541P Neurosurgery for the Generalist and Clinical Specialist (2) W
Kelly, Loeser
Series of lectures, seminars, and clinical demonstrations designed to identify and describe those diagnostic and therapeutic aspects of neurosurgical disease, the understanding of which is essential in the general practice of medicine. This course does not include experience in patient care, nor does it emphasize research data or techniques. The initial diagnosis and management of such conditions as prolonged follow-up and management planning for a chronic disease. Prerequisites: MED 665P and permission.

NR 697P Neurological Surgery Special Electives (*, max. 24) AWSpS
Ward
By specific arrangement, for qualified students, special clerkship, externship, or research opportunities can at times be made available at institutions other than the University of Washington. The faculty can advise students of possible opportunities. Students wishing to elect this course should obtain from the Dean's office a "Special Assignment" form at least one month before preregistration. Prerequisite: permission.

OBSTETRICS AND GYNECOLOGY

Courses numbered with a "P" suffix are not graduate courses and are restricted to medical student enrollment only.

OB GY 498 Undergraduate Thesis (*) AWSpS
Gibson
By arrangement.

OB GY 499 Undergraduate Research (*) AWSpS
Heinrichs
Prerequisite: permission.

OB GY 579P Obstetric and Gynecologic Investigation (*) AWSpS
Heinrichs
The investigation may cover any one of the following fields: uterine muscle physiology, toxemias of pregnancy, hormone assays in obstetrics and endocrinology, obstetric and gynecologic oncology. By arrangement.

1980 (Jan 11) - Collaboration w/ Dr. Peter Wright on cloning technology at the Fred Hutchinson Cancer Research Center

No full page copy ..

Daily News-Miner, Fairbanks, Alaska, Friday, January 11, 1980—9

Cloning technology opens frontier in cancer research

HOT ON THE TRAIL—Dr. Peter Wright of the Fred Hutchison Research Center is part of a research team using cloning technology in cancer studies. Wright and his colleagues are finding out which types of antibodies fight a cancerous tumor. They could then use cloning to mass-produce the antibody which would be administered to a patient to increase a natural attack on a cancer.

(Science News Service photo)

By GRANT FJERMEDAL
Science News Service

SEATTLE—Some very exciting things are happening in cancer research thanks to cloning technology.

Researchers at the Fred Hutchinson Cancer Research Center downplay their work for fear of raising unfulfilled hopes. But even the researchers seem excited about what cloning techniques are allowing them to do.

Their work may result in cancer treatments that are much more effective and specific than many of the methods used today.

Looking into the future, one can see that such cloning work could at least raise the possibility of developing vaccines that could prevent certain types of cancer.

The work has to do with being able to mass-produce specific kinds of antibodies that will attack cancer cells—no matter where they might be hiding in the body. Antibodies are the soldiers of the body—attacking anything that is marked as being foreign.

It is as if everything that is supposed to be in the body has a name tag. And anything that isn't supposed to be in the body also has a tag—only a different one. These different tags for foreigners are called antigens, and they trigger the antibodies into action.

It appears that when normal cells become cancerous they develop antigens as part of their change. These antigens could be very important flags.

There is great irony in the clone the researchers are creating—joining a cancerous tumor cell with a normal cell capable of producing the precise kind of antibody needed to kill the tumor cells.

This is done because cancer cells are comparatively easy to grow outside the body. Tumor cells have been kept alive in labs for decades. But the normal cells that produce antibodies have proven much more difficult to grow in the lab.

By cloning the two together you get a hybrid cell that is easy to keep alive in the lab and that produces antibodies.

This allows for the mass production of antibodies. Animal studies have found that these antibodies can then be injected into the body to fight the very cancer that triggered their creation.

Because antibodies attack only the cells flagged with antigens, they travel to the cancerous tumors and work specifically against them.

At the Fred Hutchinson Cancer Research Center, Dr. Peter Wright and Dr. Robert Nowinski and their colleagues are using cloning to first find out exactly which of the many types of antibodies is fighting the tumor. They then turn to mass producing this antibody in the lab so that they can inject them into the patient to greatly increase this natural attack on the cancer.

Limited experimental work with volunteer cancer patients has only recently begun and it will be some time before it is known exactly how well the approach works in humans.

Wright said that if such tumor-specific antibodies can be mass produced outside the body and then injected, they may prove to be quite effective in dealing with the problem of metastasized tumors.

Metastasis is the term used to describe the spread of cancer tumors from the area of origin to other parts of the body. Tumor-specific antibodies should be able to flow through the blood stream and fight the cancer cells wherever they detect them.

Without such outside help, it appears that the body probably wouldn't be able to produce enough of the proper antibody quickly enough to successfully deal with the cancer.

"In the body there is a limit to how much antibody can be made," said Nowinski. "It is regulated. In a mouse the limit might be 1,000 units of active antibody. But in a test-tube we can create 30 million."

Wright said another treatment possibility may be in combining the antibodies with toxic substances. In this way you could piggyback poisons directly to tumor cells.

This would be a tremendous refinement of current chemotherapy which works with a much broader approach, poisoning many normal fast-growing cells as well as the cancerous ones.

It may also become possible to combine the antibodies with tiny radioactive particles that would be delivered only to the tumor cells. This would be a great refinement on the radiation treatments that now take a toll in normal cells while in pursuit of the cancerous ones.

From work in animals it appears that cancerous cells have antigens marking them as targets for antibodies regardless of how the cancer was started.

A big question in humans will be whether the antigens change significantly from person to person and from one type of cancer to another.

If all cancers that began in the lungs had the same type of antigen, it might be possible to use the antigens to make a vaccine to prevent lung cancer.

"If there were antigens common to lung tumors or colon tumors, then a vaccine program may very well be feasible," said Wright. "We don't know the answer, but the important thing is we should be able to know a lot more very soon by using this hybrid technology."

Wright said the technique of cloning cells to produce antibodies was developed in England by Dr. Cesar Milstein in 1975. It was his work that has opened up so many of the possibilities that researchers like Wright and Nowinski are trying to nail down.

The possibilities of cancer vaccines may still be far off, but this new technology may soon lead to treatments that are far more specific and effective than the much broader approaches we must now take toward treating cancer.

"It is the kind of advance that probably comes along once in a lifetime," Wright said of the Milstein work. "We aren't the only ones working in this area, and we aren't the only ones to see the tremendous potential. You have to be a dummy not to see the enormous potential for this. It has revolutionized what we could do."

18 ANDERSON DAILY BULLETIN Thursday, July 31, 1980

Antibody discovery could yield new disease treatments

NEW YORK (AP) — New treatments for diseases from flu to malaria may be on the horizon with the announcement by Stanford University researchers of the manufacture of pure human antibodies, scientists say.

Antibodies are key elements in the body's defense against infection. They help the body recognize and attack specific germs.

Drs. Henry Kaplan and Lennart Olsson, a Danish researcher on leave at Stanford, have bred a hybrid cell line that makes antibodies and can be kept alive indefinitely in an artificial cell culture.

The work by Kaplan and Olsson caps a search by scientists around the world that began after British scientists Georges Kohler and Cesar Milstein learned in 1975 how to make mouse antibodies.

Mouse antibodies cannot be used in therapy for human diseases since the human body would reject them.

"The field is perched right now for exciting developments," said Dr. Robert Nowinski, director of the Tumor Virology Program at the Fred Hutchinson Cancer Research Center in Seattle, one of the many researchers working on related problems.

"The first round was developing the system for making antibodies in mice ... The second round will be to take this understanding and apply it to human antibodies," he said.

Kaplan and Olsson, fusing a human cancer cell with an antibody-producing cell, derived a combined cell called a "hybridoma" that makes the same antibodies that the antibody-producing cell normally would have, Kaplan said.

The antibody-producing cell determines what antibody the hybridoma will make. The cancer cell causes it to divide and grow again and again.

Parole denied Manson disciple Pat Krenwinkel

FRONTERA, Calif. (AP) — A parole board, saying Patricia Krenwinkel was "extremely callous" to human suffering, has refused for a third time to free the convicted murderer, a disciple of Charles Manson.

The board Wednesday rejected Miss Krenwinkel's contention that she was a confused product of the 1960s. She said her crimes were not unique and asked for psychological studies on how to prevent similar "atrocities."

"I was a child of the '60s," Miss Krenwinkel told the Board of Prison Terms. "There are thousands of people out there not much different from myself."

Deputy District Attorney Stephen Kay challenged Miss Krenwinkel's assertion that she was typical of her generation.

"All of the flower children did not commit murder," Kay said.

Miss Krenwinkel, who is housed at a state women's prison at Frontera, has served nine years on a life sentence for a conviction in the 1969 Tate-LaBianca slayings committed by the Manson "family." Miss Krenwinkel was convicted of stabbing coffee heiress Abigail Folger 28 times and mutilating the bodies of grocery store owners Leno and Rosemary LaBianca. Actress Sharon Tate also died in the murder spree.

Under California law, Miss Krenwinkel became eligible for an annual parole review after serving seven years.

In a two-hour hearing, Miss Krenwinkel never mentioned Manson's name but spoke of the feelings that led her to follow the cult leader.

Genetics for profit

Scientist mixes business with research

By BILL DIXON
Of the Statesman-Journal

It's one thing to be a pioneer in science and quite another to be a pioneer in business.

Robert Nowinski is trying to be both.

"The mix of my life has changed substantially," Nowinski said, "from being a pure scientist to being a business scientist. It's a very enjoyable mix."

Nowinski was in Salem on Friday to tell physicians at Salem Hospital Memorial Unit about the promise he sees for biotechnology in general and his company, Genetic Systems Corp. of Seattle, in particular.

Biotechnology makes it possible for man to replicate or enhance life processes. In Nowinski's case, that has meant the discovery and mass production of a kind of police force against disease.

Two years ago, Nowinski never would have made the trip to Salem — at least not as a salesman. Then, at the age of 34, he was a leader in antibody research with a professorship at the University of Washington and a budget of more than $600,000 a year.

That was before Nowinski helped found Genetic Systems in November 1980. Now he is the scientific director and executive vice president of an $8 million operation that has yet to sell a product on the open market.

The first Genetic Systems product, a diagnostic antibody for a venereal disease called chlamydia, will be out near the end of this year, Nowinski said. Starting next year the company will market a test for herpes that is faster and more accurate than current methods, he said.

And the company is working with Cutter Laboratories Inc. in Berkeley, Calif., to develop a treatment for pseudonomas, an antibiotic-resistant bacteria that is a major cause of death among burn and cancer victims.

In order for Genetic Systems to survive, Nowinski said, he has to split his time between research and business.

Nowinski's work revolves around monoclonal antibodies, one of the offshoots of a biotechnology revolution that began in the mid-1970s.

"Antibodies are natural molecules that our bodies make for defense," Nowkinski said. "They bind to the substances they are made against, so they can be used for identification. And they can inactivate the substances that they bind to."

The problem with antibody production, Nowinski said, is that each antibody works against only one substance, or antigen. But animals and humans, who are the breeding ground for the antibodies used by science, produce many antibodies at once. Until recently, there was no way to extract a specific antibody or mass produce it.

Since the antibodies had to come from living subjects, there was an inherent limit on how long any antibody might be available. Once the host died, you had to start all over again.

But in 1975, Nowinski said, two British researchers took a giant step toward solving those problems.

With their method, as in the past, a living host receives an injection of an antigen and responds by growing cells to produce antibodies. There the two paths separate.

Using the new method, cells are removed from the host's spleen and separated to obtain a batch of the specific antibody producers. Then those cells are fused with cancer cells in a mixture that contains polyethylene glycol, an ingredient of anti-freeze.

Nowinski said cancer cells are used because they are "immortal" — that is, unlike other cells, cancer cells will continue to grow indefinitely given the proper living conditions.

The spleen-cancer hybrid cells are selected and put into test tubes, where they reproduce without changing, or clone. If all goes well, the hybrid cells are then used to produce a single antibody. Hence the name monoclonal antibody.

So far, that part of Nowinski's work has gone well. In 1980 he and his research team at the Fred Hutchinson Cancer Research Center in Seattle were the first to use monoclonal antibodies to treat cancer in mice. Last year, the same team was among the first three in the world to demonstrate production of human monoclonal antibodies.

Making Genetic Systems profitable hasn't been an automatic process, but Nowinski said the signs are encouraging.

Despite a $400,000 loss its first year and a predicted loss of somewhere between $500,000 and $1 million this year, the company's policy of obtaining support before it starts to develop a product should stand it in good stead, Nowinski said.

The potential for developing products is tremendous, Nowinski said. Within 20 years, he said, biotechnology and genetic engineering will produce big advancements not only in medicine but also in agriculture and industry.

ROBERT NOWINSKI

But for now, a company like Genetic Systems still has to sell itself.

"We don't have a track record right now," Nowinski said, "but we're an exciting possibility."

Thursday, May 20, 1993 THE PHILADELPHIA INQUIRER

Review: *Art*

A class act at Princeton art museum

By Edward J. Sozanski
INQUIRER ART CRITIC

PRINCETON, N.J. — Aside from being the author of a kiss-and-tell memoir about his years as director of the Metropolitan Museum of Art, Thomas P.F. Hoving is a 1953 graduate of Princeton University.

Hoving has called on his skills as a former curator to put together a small exhibition of American art selected from the collections of some of his college classmates. It continues at Princeton's art museum through July 3.

The show, which celebrates the 40th reunion of Hoving's class, was proposed by Leonard L. Milberg, one of the more prominent collectors among the lenders. Hoving, who also contributed several works, surveyed the possibilities and decided to focus on American art.

His decision at least gives the show of 49 works, mostly paintings, some thematic consistency, which isn't usually the case with exhibitions of this kind. The museum has done alumni exhibitions before, but never one devoted to a single class.

"Ship in Fog, Gloucester Harbor" *by Fitz Hugh Lane is in the "Class of 1953" exhibition at Princeton through July 3.*

Hoving's classmates appear to have collected judiciously, particularly in the 19th century. That half of the show includes a fine *Orchid and Hummingbird* by Martin Johnson Heade, an evocative harbor scene by Fitz Hugh Lane, a sensitive portrait of a woman by Samuel F.B. Morse and a caricature by Thomas Nast of William Marcy "Boss" Tweed.

Hoving's two contributions are among the more distinguished in the 20th-century section, which includes a painting by Jonathan Borofsky and collage of woven newsprint by Laurie Anderson. Hoving lent a vividly colored monotype by Wendy Mark and a small welded steel horse by Judy Brown.

The collage came from W. Loeber Landau, along with two photographs by William Wegman. The Borofsky belongs to Wellington S. Henderson, who is further represented by Jasper Johns and David Hockney lithographs.

The most unusual piece in the show is a silk quilt that was owned by Hawaii's last monarch, Queen Liliuokalani, who was deposed in 1893. The quilt features crossed Hawaiian flags under a crown in the center and Union Jacks in the corners. It was lent by Alexander Brody.

The museum's other current exhibition, which runs through July 17, features a selection of European modern art from the collection of Robert Nowinski and his wife, Connie, of Seattle. The show comprises 29 individual works on paper, a suite of 20 prints by Matisse and four sculptures.

Although their collection is only nine years old, the Nowinskis have managed to acquire a number of strong works. Their taste is conventional. Except for two drawings by Balthus, another by Egon Schiele, an abstract watercolor by Wassily Kandinsky and a mixed-media drawing by Francis Picabia, they have followed a well-worn path.

If You Go

■ "American Art from the Class of 1953 Collections" continues at the Princeton University Art Museum through July 3. "Twentieth-Century Masterworks on Paper and Sculpture from the Nowinski Collection" runs through July 17. The museum is in the middle of the campus; a large sculpture by Picasso, *Head of a Woman*, stands in front. Hours: 10 a.m. to 5 p.m. Tuesdays through Saturdays, 1 to 5 p.m. Sundays. Telephone: 609-258-3787.

2005-12-14-seattle-times-early-biotech-superstar-accused-of-being-deadbeat-dad.pdf

https://www.seattletimes.com/seattle-news/one-of-biotechs-early-superstars-accused-of-being-a-deadbeat-dad/

By Maureen O'Hagan and Sheila Farr

At one time, he was a high-flying CEO whose companies promised help for cancer patients. He had a Picasso hanging in his Edmonds home and owned one of Seattle's swankiest art galleries.

The day before Thanksgiving, Robert Nowinski was arrested on federal charges of failing to pay child support. Once among the most important players in the Seattle biotech world, Nowinski has allegedly become, in the parlance of child-welfare workers, a "deadbeat dad."

Federal prosecutors say he fell nearly $125,000 behind on his child-support payments, and have charged him in a two-count criminal complaint.

Nowinski says he's broke.

If Nowinski's fall appears abrupt, his rise to the top was just as dramatic.

It was clear from his arrival in Seattle in 1975, as a brash young scientist at the Fred Hutchison Cancer Research Center, that he had a rare combination of skills: the mind of a scientist but the instincts of a businessman.

"He was able to articulate the dream and get people to put money into it," said Bruce Montgomery, CEO of Corus Pharma, who used to work at one of Nowinski's companies.

After just a few years, he helped found a new biotech company, a field that was in its infancy.

In all, he founded four publicly traded biotech companies over the course of about a decade: Genetic Systems, which worked to develop antibodies for use in cancer treatment, Icos, PathoGenesis and [**VaxGen, Incorporated**]. He also helped found another biotech company, Primal.

Bill Gates put millions into Nowinski's dream, as did Paul Allen. Even outside investors, who at that time shunned the unproven field of biotech, were won over by Nowinski's vision.

"If you took the 15 largest biotechnology companies of the 1980s, we founded three of them," he bragged to a Seattle Times reporter in 1990.

In each case, however, he got out rather quickly — often winding up with millions. Genetic Systems, for example, was bought by Bristol-Myers Squibb, making Nowinski's stock options worth $10 million.

Nowinski's knack for coming out on top earned him the nickname "No-lose-ski."

In the mid-1990s, Nowinski dove into the art world, renting a 5,000-square-foot space in Pioneer Square, doing an elegant remodel and installing a high-tech interactive "virtual gallery" so clients could project big-screen images of available artworks.

The opening show at Meyerson & Nowinski was called "Picasso and Friends." His partner was Ronnie Meyerson, a New York art dealer.

Nowinski spoke enthusiastically to reporters about his plans to bring the work of internationally acclaimed artists to Seattle and his expectations for becoming a nationally recognized gallery. Less than three years later, the gallery closed, leaving many Seattle-area artists without representation.

Around the time of his art adventure, Nowinski's marriage was dissolving. In 1996, Connie Nowinski filed for divorce. The pair had a prenuptial agreement in which Connie was to get 70 percent of communal property and Robert was to get all of the property he brought into the marriage, court documents say.

Under the terms of the settlement, Robert was to pay Connie $9,200 per month for two years. He also agreed to give her $2.25 million broken into several lump-sum payments. Meanwhile, Robert kept various investments; stock accounts in his name; their fine-art collection, which included a Picasso worth nearly $1 million; and other items.

Within four years, Connie filed suit, claiming he had hidden certain assets from her during the divorce. A judge determined he owed her 180,000 shares of VaxGen stock.

In 2003, Nowinski was hit with another lawsuit. This one claimed he had raided a trust fund he had set up for his three children, ages 15, 14 and 11. He admitted in a deposition to "borrowing" from the fund, which contained $500,000 worth of biotech stock, and selling it, court documents state.

"At no time since taking this 'loan' have the funds ever been repaid, although Mr. Nowinski testified that he has been in possession of funds in excess of several million dollars in the intervening period," a guardian appointed to safeguard the children's financial interests wrote in a report to the court.

A judgment of $1.2 million was entered against him in connection with the trust-fund case. He told the guardian that before the divorce, he had "$20 million" and "now I have nothing."

Nowinski, who is on pretrial release, couldn't be reached to comment for this story. His defense lawyer in New York declined to comment.

About the time of Connie Nowinski's lawsuit, Robert Nowinski left Washington abruptly without telling the family, essentially disappearing for several months, the guardian's report said. It turned out he had moved to New York and subsequently filed for bankruptcy. As part of the bankruptcy, his fine-art collection — which included works by Picasso and Matisse, among other noted artists — was liquidated.

This fall, Nowinski told The Seattle Times he had been trying to broker a billion-dollar deal with a local biotech company on behalf of some major investors. He said he had designs on taking over the company as well.

The old Nowinski, the media-savvy deal-maker, appeared to be back.

But in October, he was accused of failing to make his $5,300-a-month child-support payments. According to the charging documents, Nowinski stopped paying in 2003, about the time his ex-wife remarried.

By August 2005, he was nearly $125,000 in arrears. And yet "From (Connie Nowinski's) observations, he never seems to have a lack of money," the investigating agent, Michael Nichols, wrote.

Jeff Sullivan, chief of the criminal division of the U.S. Attorney's Office, said federal prosecutors here file only about a half-dozen child-support cases a year, and then only when there's a good chance of collecting.

He noted that while Nowinski could face jail time if convicted, their foremost concern is getting the delinquent child support.

Seattle Times staff reporters Christopher Schwarzen and Ben Romano and news researcher Miyoko Wolf contributed to this report.

2008-08-02-los-angeles-times-suspect-stood-to-gain-from-anthrax-panic.pdf

Suspect stood to gain from anthrax panic

By DAVID WILLMAN

AUG. 2, 2008 12 AM PT

TIMES STAFF WRITER

Bruce E. Ivins, the government biodefense scientist linked to the deadly anthrax mailings of 2001, stood to gain financially from massive federal spending in the fear-filled aftermath of those killings, the Los Angeles Times has learned.

Ivins is listed as a co-inventor on two patents for a genetically engineered anthrax vaccine, federal records show. Separately, Ivins also is listed as a co-inventor on an application to patent an additive for various biodefense vaccines.

Ivins, 62, died Tuesday in an apparent suicide in Maryland. Federal authorities had informed his lawyer that criminal charges related to the mailings would be filed

As a co-inventor of a new anthrax vaccine, Ivins was among those in line to collect patent royalties if the product had come to market, according to an executive familiar with the matter.

The product had languished on laboratory shelves until the Sept. 11 attacks and the anthrax mailings, after which federal officials raced to stockpile vaccines and antidotes against potential biological terrorism.

A San Francisco-area biotechnology company, [**VaxGen, Incorporated**], won a federal contract worth $877.5 million to provide batches of the new vaccine. The contract was the first awarded under legislation promoted by President Bush, called Project BioShield.

One executive who was familiar with the matter said that, as a condition of its purchasing the vaccine from the Army, [**VaxGen, Incorporated**] had agreed to share sales-related proceeds with the inventors.

“Some proportion would have been shared with the inventors,” said the executive, who spoke anonymously because of contractual confidentiality. “Ivins would have stood to make tens of thousands of dollars, but not millions.”

Two years after the contract was awarded to VaxGen, the pact was terminated when the company could not deliver its batches on schedule. The termination meant that VaxGen was not paid, nor were Ivins and his co-inventors.

Ivins also was listed as one of two inventors of another biodefense-related product that has won federal sponsorship.

According to their still-pending application for a U.S. patent, the inventors hoped the additive would bolster certain vaccines’ capacity to prevent infections “from bioterrorism agents.”

From December 2002 to December 2003, the Pentagon’s Defense Advanced Research Projects Agency committed $12 million for additional testing of the experimental additive. That research money was designated for Coley Pharmaceutical Group, which was developing the additive. The company was acquired last fall by Pfizer Corp.

Samuel C. Miller, a Georgetown Law Center professor who is a patent-law expert, said that the extent to which Ivins stood to gain from the two issued patents or the one that remains pending hinges on the terms of the related contracts.

“It will depend on the business arrangements that are in place,” Miller said.

On Friday, colleagues and critics of Ivins pondered the mystery within the mystery: If Ivins did it, why?

One former senior official with Ivins’ employer, the U.S. Army Medical Research Institute of Infectious Diseases, whom the FBI questioned at length about Ivins, said he believed his former colleague wanted more attention -- and resources -- shifted to biological defense.

“It had to have been a motive,” said the former official, who suspects that Ivins was the culprit. “I don’t think he ever intended to kill anybody. He just wanted to prove ‘Look, this is possible.’ He probably had no clue that it would aerosolize through those envelopes and kill those postal workers.”

Of the five people killed by the mailings, two worked for the U.S. Postal Service in the Washington, D.C., area; one was a photo editor in Palm Beach County, Fla.; another was a hospital supply provider in New York City; and the last known victim was a 94-year-old woman in Connecticut.

Several letters were addressed to prominent people -- two U.S. senators and NBC news anchor Tom Brokaw, for example.

For nearly 30 years, Ivins served far from the limelight, a PhD microbiologist who drew a civil servant’s pay while handling some of the most deadly

pathogens on Earth -- five spores of anthrax.

The deadly mailings of anthrax-tainted envelopes transported Ivins from the backwater of government scientific research at Ft. Detrick, Md., to the center of the nation's fledgling war on terrorism. It also spurred multibillion-dollar national security initiatives.

Ivins was thrust into the federal investigation of the mailings as well. He helped the FBI analyze anthrax recovered from a letter addressed to then-Senate Majority Leader Tom Daschle (D-S.D.).

He also played a lead role in helping a private company, BioPort, win regulatory approval to continue making the vaccine required for U.S. service personnel deployed to Iraq, Afghanistan and other regions.

From 2000 to early 2002, Ivins and two colleagues from USAMRIID helped BioPort resolve problems related to the potency of the vaccine. Because of those and other manufacturing difficulties, production had been suspended. The efforts of Ivins and his colleagues helped BioPort win FDA approval to resume production.

At a Pentagon ceremony on March 14, 2003, Ivins and two colleagues from USAMRIID were bestowed the Decoration of Exceptional Civilian Service, the highest honor given to nonmilitary employees of the Defense Department.

"Awards are nice," Ivins said in accepting the honor. "But the real satisfaction is knowing the vaccine is back on line."

The Times sought earlier this year to obtain annual financial disclosure statements filed by Ivins with his employer. USAMRIID spokeswoman Caree Vander Linden said last month that Ivins had filed financial reports exempt from disclosure under the Freedom of Information Act.

Ivins' apparent suicide and the Justice Department's decision to bring criminal charges against him were first reported Thursday night by The Times. On Friday, Ivins' lawyer, Paul F. Kemp, defended his client and said that Ivins had cooperated fully with the FBI.

"We assert his innocence in these killings, and would have established that at trial," Kemp said, implicitly confirming that Ivins had been about to be formally charged. "The relentless pressure of accusation and innuendo takes its toll in different ways on different people. . . . In Dr. Ivins' case, it led to his untimely death."

Kemp did not respond to telephone calls and e-mails for this article.

Key dates in the investigation of the anthrax attacks

2001

September-October: Anthrax is mailed to lawmakers on Capitol Hill and members of the news media in New York and Florida. By late November, five people are dead and 17 sickened. The victims include postal workers and others who came into contact with the anthrax.

2002

January: The Senate office building where anthrax- tainted letters were sent reopens after three months and fumigation. FBI doubles the reward for helping solve the case to $2.5 million.

June: The FBI is scrutinizing 20 to 30 scientists who might have had the knowledge and opportunity to send the anthrax letters, a U.S. official says.

August: Law enforcement officials and Atty. Gen. John D. Ashcroft call Steven J. Hatfill, a biowarfare expert, a "person of interest" in the investigation.

2003

June: The FBI drains a pond in Frederick, Md., in search of evidence. Frederick is the home of the Army Medical Research Institute of Infectious Diseases, one of the nation's main anthrax research centers. Nothing suspicious is found.

August: Hatfill sues Ashcroft and other government officials, accusing them of using him as a scapegoat and demanding that they clear his name.

December: Postal workers begin moving back into Washington's main mail center, more than two years after anthrax-laced letters killed two employees. The Brentwood facility underwent more than $130 million worth of decontamination and renovation.

2004

August: FBI searches homes of Dr. Kenneth M. Berry, who founded a group to train medical staffers to respond to biological disasters, as part of the anthrax investigation. No charges are filed.

July 11: Bio-ONE, a company founded by former New York City Mayor Rudolph W. Giuliani, fumigates the former headquarters of the Sun, the Florida supermarket tabloid that was the first target in the anthrax attacks.

July 13: Hatfill sues the New York Times for defamation, claiming the newspaper ruined his reputation after it published a series of columns pointing to him as the culprit.

2005

March 10: Sensor at Pentagon mail room indicates the possible presence of anthrax.

March 14: Alarm at a second Pentagon mail facility also signals a possible anthrax presence. The post office in Hamilton, N.J., that handled anthrax-laced letters in 2001 reopens. Further testing determines no anthrax in Pentagon mail rooms.

2006

April 11: It is reported that Hatfill's lawyers have questioned at least two journalists and are subpoenaing others, seeking identities of their confidential government sources.

Oct. 23: A federal judge orders the New York Times to disclose a columnist's confidential sources.

2007

Jan. 12: A federal judge dismisses Hatfill's libel lawsuit against the New York Times.

Aug. 13: A federal judge says five journalists must identify the government officials who leaked details about Hatfill to them.

Oct. 2: Hatfill asks a federal judge to hold two journalists in contempt for refusing to identify their sources.

2008

March 7: A federal judge holds a former USA Today reporter in contempt and orders her to pay up to $5,000 a day if she refuses to identify her sources for stories about Hatfill.

March 11: A federal appeals court blocks the fines.

June 27: The government awards Hatfill $5.8 million to settle his violation of privacy lawsuit against the Justice Department.

July 29: Bruce E. Ivins, 62, dies of an apparent suicide at a hospital in Frederick, Md., after being informed by the FBI that charges probably were going to be brought against him in connection with the 2001 anthrax attacks.

A killer bacterium

The spores that cause anthrax -- Bacillus anthracis -- occur widely in soil, and the skin form of the infection used to be common, especially among livestock and people who work with the animals. It can be treated with antibiotics.

But once the spores are inhaled and settle in the lungs, they cause a hard-to-diagnose infection that is almost impossible to cure -- and nearly always fatal -- once symptoms start.

Experts estimate that 8,000 to 10,000 spores taken into the lungs can cause inhaled anthrax. The infection is not contagious.

Infection with the skin form of the disease can result from substantially fewer spores. On the skin, the ailment starts after three to five days with a small, painless blister that is red around the edges. A day or two later, this becomes an open sore that is especially recognizable because it is black. Eventually, this dries up and leaves a black scab, which falls off after a week or two.

The usual treatment is a common antibiotic, such as penicillin, doxycycline or Cipro, which are extremely effective

Left untreated, perhaps 5% of skin cases progress to a dangerous bloodstream infection, which also is almost always fatal, according to medical experts.

2011 (Dec) - SiteSelection.com : "Going Up : A biotech firm finds space in a former elevator factory."

https://siteselection.com/LifeSciences/2011/dec/biotech.cfm

by JOHN W. McCURRY

ContraFect is a biotech company pioneering the use of monoclonal antibodies and lysins (enzymes that digest the key component of bacteria, the cell wall) to treat life-threatening infectious diseases including MRSA and viruses such as influenza. The fledgling company, which moved to Yonkers, N.Y., in late 2010, has ambitious expansion plans at its new headquarters, which formerly housed Otis Elevator's manufacturing operations.

"We started as a virtual company in a small office in Manhattan with a couple of people," says Dr. Robert Nowinski, ContraFect's founder, chairman and CEO. Nowinski previously founded four biotech companies in the Seattle area which were ultimately acquired by large pharmaceutical companies.

Nowinski says while he is pleased with ContraFect's location, the company nearly wound up in Virginia.

"At the same time we looked at Yonkers, we were talking with a colleague in Virginia and were invited to come to Virginia to discuss our company," Nowinski says. "They were associated with George Mason University. The university became interested in offering us an opportunity for some space if we were willing to move the research elements of our company to Virginia. The initial plan was to create a research institute in Virginia, which would have had our company within that as one of the founders of a public-private institute on the George Mason campus."

The Virginia Legislature subsequently allocated funds for the institute, but the proposal evolved into something larger than originally planned. That caused ContraFect to re-think its position.

"The money was approved in Virginia, but as we began to put together a program, a desire developed in the Virginia Legislature to diversify the institute into not just ourselves and George Mason, but several other universities," Nowinski says. "As this became more complex, we began to see this as not as easy a task as we had anticipated."

At that point, ContraFect began reconsidering the issue of space in New York. Nowinksi returned to Yonkers to meet with Joe Cotter, founder and president of National RE/sources Group, which includes the i.park portfolio of redeveloped industrial properties. The Hudson i.park is a 24-acre (2.2-hectare) technology park in the Yonkers Waterfront District at the Yonkers Train Station. Discussions focused on the cost to build there, rent and tenant improvements.

"We are in a building that is the former Otis Elevator manufacturing plant, which is almost 100 years old," Nowinksi says. "It's a brick building that is scooped out and stands as the basic structure. As things became more complicated in Virginia, we became more interested in Yonkers, and we eventually worked out a plan with the landlord. We also completed a financing arrangement that enabled us to go forward with a larger facility than expected. We simultaneously formed other alliances in New York that suggested we would need larger lab space than initially anticipated."

Nowinski says the combination of a good arrangement with i.park and the opportunity for extensive collaboration with a New York City medical school brought Yonkers back into serious consideration. Another plus was that the building was already home to another life sciences company, Aureon Biosciences.

"We were introduced to the Yonkers economic development group and then the mayor, and in a short period of time, they began to offer various indications of assisting us," Nowinski says. "We made our decision to keep the company intact and that Yonkers would be where we would come."

ContraFect currently occupies 15,000 sq. ft (1,393 sq. m.) and employs 30. Nowinksi anticipates leasing another 22,000 sq. ft. (2,043 sq. m.) within the next several weeks. That space comes from Aureon, which filed for bankruptcy and closed in October. ContraFect also has an option on 17,500 sq. ft. (1,625 sq. m.). Nowinski expects employment to be around 45 by the end of 2012.

Nowinski says ContraFect, which was formed in late 2008, will soon be going into FDA trials with its first product. Manufacturing will initially be outsourced, but he plans to bring that process in house as the first product or two comes to market.

"The biotech industry in New York has developed relatively late," Nowinski says. "We are starting to see some growth here. Space is opening up in Manhattan with some of the large pharmaceuticals taking space to do biotech research in association with the universities there. Most of the smaller companies appear to be going into Westchester County or other areas surrounding Manhattan. We are very pleased to be in Yonkers. Ultimately we were able to get the type of space we needed, we were able to get the personnel we needed from the New York City area, which is an enormous recruiting location, and we have access to our collaborators in Manhattan."

A Brief History of NSF and the Internet

August 13, 2003

This material is available primarily for archival purposes. Telephone numbers or other contact information may be out of date; please see current contact information at media contacts.

Early Years: 1960s-1994. The Internet that many of us take for granted today arose from a series of government-funded computer networking efforts. In 1969, the precursor to the Internet began with the U.S. Defense Department's ARPAnet. ARPA-funded researchers developed many of the protocols still used for most Internet communication. Several other agencies also developed networks so their researchers could communicate and share data. In 1981, for example, the National Science Foundation (NSF) provided a grant to establish the Computer Science Network (CSNET) to provide networking services to all university computer scientists.

In 1985, NSF considered how it could provide greater access to the high-end computing resources at its recently established supercomputer centers. Because NSF intended the supercomputers to be shared by scientists and engineers around the country, any viable solution had to link many research universities to the centers.

NSFNET went online in 1986 and connected the supercomputer centers at 56,000 bits per second—the speed of a typical computer modem today. In a short time, the network became congested and, by 1988, its links were upgraded to 1.5 megabits per second. A variety of regional research and education networks, supported in part by NSF, were connected to the NSFNET backbone, thus extending the Internet's reach throughout the United States.

Creation of NSFNET was an intellectual leap. It was the first large-scale implementation of Internet technologies in a complex environment of many independently operated networks. NSFNET forced the Internet community to iron out technical issues arising from the rapidly increasing number of computers and address many practical details of operations, management and conformance.

Throughout its existence, NSFNET carried, at no cost to institutions, any U.S. research and education traffic that could reach it. At the same time, the number of Internet-connected computers grew from 2,000 in 1985 to more than 2 million in 1993. To handle the increasing data traffic, the NSFNET backbone became the first national 45-megabits-per-second Internet network in 1991.

The history of NSFNET and NSF's supercomputing centers also overlapped with the rise of personal computers and the launch of the World Wide Web in 1991 by Tim Berners-Lee and colleagues at CERN, the European Organisation for Nuclear Research, in Geneva, Switzerland. The NSF centers developed many tools for organizing, locating and navigating through information, including one of the first widely used Web server applications. But perhaps the most spectacular success was Mosaic, the first freely available Web browser to allow Web pages to include both graphics and text, which was developed in 1993 by students and staff working at the NSF-supported National Center for Supercomputing Applications (NCSA) at the University of Illinois, Urbana-Champaign. In less than 18 months, NCSA Mosaic became the Web "browser of choice" for more than a million users and set off an exponential growth in the number of Web servers as well as Web surfers. Mosaic was the progenitor of modern browsers such as Microsoft Internet Explorer and Netscape Navigator.

Privatization: 1993-1998. Commercial firms noted the popularity and effectiveness of the growing Internet and built their own networks. The proliferation of private suppliers led to an NSF solicitation in 1993 that outlined a new Internet architecture that largely remains in place today.

From that solicitation, NSF awarded contracts in 1995 for three network access points, to provide connection points between commercial networks, and one routing arbiter, to ensure an orderly exchange of traffic across the Internet. In addition, NSF signed a cooperative agreement to establish the next-generation very-high-performance Backbone Network Service. A more prominent milestone was the decommissioning of the NSFNET backbone in April 1995.

In the years following NSFNET, NSF helped navigate the road to a self-governing and commercially viable Internet during a period of remarkable growth. The most visible, and most contentious, component of the Internet transition was the registration of domain names. Domain name registration associates a human-readable character string (such as "nsf.gov") with Internet Protocol (IP) addresses, which computers use to locate one another.

The Department of Defense funded early registration efforts because most registrants were military users and awardees. By the early 1990s, academic institutions comprised the majority of new registrations, so the Federal Networking Council (a group of government agencies involved in networking) asked NSF to assume responsibility for non-military Internet registration. When NSF awarded a five-year agreement for this service to Network Solutions, Inc. (NSI), in 1993, there were 7,500 domain names.

In September 1995, as the demand for Internet registration became largely commercial (97 percent) and grew by orders of magnitude, the NSF authorized NSI to charge a fee for domain name registration. Previously, NSF had subsidized the cost of registering all domain names. At that time, there were 120,000 registered domain names. In September 1998, when NSF's agreement with NSI expired, the number of registered domain names had passed 2 million.

The year 1998 marked the end of NSF's direct role in the Internet. That year, the network access points and routing arbiter functions were transferred to the commercial sector. And after much debate, the Department of Commerce's National Telecommunications and Information Administration formalized an agreement with the non-profit Internet Corporation for Assigned Numbers and Names (ICANN) for oversight of domain name registration. Today, anyone can register a domain name through a number of ICANN-accredited registrars.

NSF after NSFNET. The decommissioning of NSFNET and privatization of the Internet did not mark the end of NSF's involvement in networking. NSF continues to support many research projects to develop new networking tools, educational uses of the Internet and network-based applications.

Through its programs, NSF helps research and education institutions—including those serving underrepresented minorities, rural areas, and Native American reservations—make and enhance their connections to the Internet. NSF has also been instrumental in providing international connections services that have bridged the U.S. network infrastructure with countries and regions including Europe, Mongolia, Africa, Latin America, Russia and the Pacific Rim. In addition, NSF has continued to extend the reach of the highest-performance U.S. research and education networks by supporting connectivity and collaborations with their counterparts in Canada, Europe and Asia.

NSF Internet Experts

Thomas Greene, senior program director in the CISE Advanced Networking Infrastructure and Research division, oversees a number of NSF's post-NSFNET Internet efforts, including national and international connections programs. tgreene@nsf.gov, 703-292-8948.

Larry Landweber, CISE senior advisor on networking, proposed the CSNET concept in 1979 and organized the workshops that led to its creation in 1981. He was an advisor to NSF during the development of NSFNET and helped establish the first Internet gateways between the United States and countries in Europe, Asia and Latin America. llandweb@nsf.gov, 703-292-8900.

George Strawn, currently NSF's Chief Information Officer, was the NSFNET program director from 1991 to 1993. From 1993 to 1995, he was involved with defining and deploying the privatized Internet architecture, and from 1995 to 1998 as networking division director, he led NSF's efforts in the Next Generation Internet Initiative. gstrawn@nsf.gov, 703-292-8102.

NSFNET history

The **National Science Foundation Network** (**NSFNET**) was a program of coordinated, evolving projects sponsored by the National Science Foundation (NSF) from 1985 to 1995 to promote advanced research and education networking in the United States.[1] The program created several nationwide backbone computer networks in support of these initiatives. Initially created to link researchers to the NSF-funded supercomputing centers, through further public funding and private industry partnerships it developed into a major part of the Internet backbone.

The National Science Foundation permitted only government agencies and universities to use the network until 1989 when the first commercial Internet service provider emerged. By 1991, the NSF removed restrictions on access and the commercial ISP business grew rapidly.[2]

History[edit]

See also: History of the Internet

Following the deployment of the Computer Science Network (CSNET), a network that provided Internet services to academic computer science departments, in 1981, the U.S. National Science Foundation (NSF) aimed to create an academic research network facilitating access by researchers to the supercomputing centers funded by NSF in the United States.[3]

In 1985, NSF began funding the creation of five new supercomputing centers:

- John von Neumann Center at Princeton University
- San Diego Supercomputer Center (SDSC) on the campus of the University of California, San Diego (UCSD)
- National Center for Supercomputing Applications (NCSA) at the University of Illinois at Urbana–Champaign
- Cornell Theory Center at Cornell University
- Pittsburgh Supercomputing Center (PSC), a joint effort of Carnegie Mellon University, the University of Pittsburgh, and Westinghouse

NSF's three tiered network architecture

Also in 1985, under the leadership of Dennis Jennings, the NSF established the National Science Foundation Network (NSFNET). NSFNET was to be a general-purpose research network, a hub to connect the five supercomputing centers along with the NSF-funded National Center for Atmospheric Research (NCAR) to each other and to the regional research and education networks that would in turn connect campus networks. Using this three tier network architecture NSFNET would provide access between the supercomputer centers and other sites over the backbone network at no cost to the centers or to the regional networks using the open TCP/IP protocols initially deployed successfully on the ARPANET.

56 kbit/s backbone[edit]

56K NSFNET Backbone, c. 1988

T1 NSFNET Backbone, c. 1991

T3 NSFNET Backbone, c. 1992

NSFNET Traffic 1991, NSFNET backbone nodes are shown at the top, regional networks below, traffic volume is depicted from purple (zero bytes) to white (100 billion bytes), visualization by NCSA using traffic data provided by the Merit Network.

The NSFNET initiated operations in 1986 using TCP/IP. Its six backbone sites were interconnected with leased 56-kbit/s links, built by a group including the University of Illinois National Center for Supercomputing Applications (NCSA), Cornell University Theory Center, University of Delaware, and Merit Network. PDP-11/73 minicomputers with routing and management software, called Fuzzballs, served as the network routers since they already implemented the TCP/IP standard.

This original 56 kbit/s backbone was overseen by the supercomputer centers themselves with the lead taken by Ed Krol at the University of Illinois at Urbana–Champaign. PDP-11/73 Fuzzball routers were configured and run by Hans-Werner Braun at the Merit Network[4] and statistics were collected by Cornell University.

Support for NSFNET end-users was provided by the NSF Network Service Center (NNSC), located at BBN Technologies and included publishing the softbound "Internet Manager's Phonebook" which listed the contact information for every issued domain name and IP address in 1990.[5] Incidentally, Ed Krol also authored the *Hitchhiker's Guide to the Internet* to help users of the NSFNET understand its capabilities.[6] The Hitchhiker's Guide became one of the first help manuals for the Internet.

As regional networks grew the 56 kbit/s NSFNET backbone experienced rapid increases in network traffic and became seriously congested. In June 1987 NSF issued a new solicitation to upgrade and expand NSFNET.[7]

1.5 Mbit/s (T-1) backbone[edit]

As a result of a November 1987 NSF award to the Merit Network, a networking consortium by public universities in Michigan, the original 56 kbit/s network was expanded to include 13 nodes interconnected at 1.5 Mbit/s (T-1) by July 1988. Additional links were added to form a multi-path network, and a node located in Atlanta was added. Each of the backbone nodes was a router called the Nodal Switching System (NSS). The NSSes were a collection of multiple (typically nine) IBM RT PC systems connected by a Token Ring local area network. The RT PCs ran AOS, IBM's version of Berkeley UNIX, and was dedicated to a particular packet processing task.[8]

Under its cooperative agreement with NSF the Merit Network was the lead organization in a partnership that included IBM, MCI, and the State of Michigan. Merit provided overall project coordination, network design and engineering, a Network Operations Center (NOC), and information services to assist the regional networks. IBM provided equipment, software development, installation, maintenance and operations support. MCI provided the T-1 data circuits at reduced rates. The state of Michigan provided funding for facilities and personnel. Eric M. Aupperle, Merit's President, was the NSFNET Project Director, and Hans-Werner Braun was Co-Principal Investigator.

From 1987 to 1994, Merit organized a series of "Regional-Techs" meetings, where technical staff from the regional networks met to discuss operational issues of common concern with each other and the Merit engineering staff.

During this period, but separate from its support for the NSFNET backbone, NSF funded:

- the NSF Connections Program that helped colleges and universities obtain or upgrade connections to regional networks;
- regional networks to obtain or upgrade equipment and data communications circuits;
- the NNSC, and successor Network Information Services Manager (aka InterNIC) information help desks;[9]
- the International Connections Manager (ICM), a task performed by Sprint, that encouraged connections between the NSFNET backbone and international research and education networks; and
- various ad hoc grants to organizations such as the Federation of American Research Networks (FARNET).

The NSFNET became the principal Internet backbone starting in the Summer of 1986, when MIDnet, the first NSFNET regional backbone network became operational. By 1988, in addition to the five NSF supercomputer centers, NSFNET included connectivity to the regional networks BARRNet, JVNCNet, Merit/MichNet, MIDnet, NCAR, NorthWestNet, NYSERNet, SESQUINET, SURAnet, and Westnet, which in turn connected about 170 additional networks to the NSFNET.[10] Three new nodes were added as part of the upgrade to T-3: NEARNET in Cambridge, Massachusetts; Argone National Laboratory outside of Chicago; and SURAnet in Atlanta, Georgia.[11] NSFNET connected to other federal government networks including the NASA Science Internet, the Energy Science Network (ESnet), and others. Connections were also established to international research and education networks starting in 1988 to Canada, France,[12][13] the Netherlands,[14] then to NORDUnet (serving Denmark, Finland, Iceland, Norway, and Sweden),[15] and later to many others.[16][17]

Two Federal Internet Exchanges (FIXes) were established in June 1989[18] under the auspices of the Federal Engineering Planning Group (FEPG). FIX East, at the University of Maryland in College Park and FIX West, at the NASA Ames Research Center in Mountain View, California. The existence of NSFNET and the FIXes allowed the ARPANET to be phased out in mid-1990.[19]

Starting in August 1990 the NSFNET backbone supported the OSI Connectionless Network Protocol (CLNP) in addition to TCP/IP.[20] However, CLNP usage remained low when compared to TCP/IP.

Traffic on the network continued its rapid growth, doubling every seven months. Projections indicated that the T-1 backbone would become overloaded sometime in 1990.

A critical routing technology, Border Gateway Protocol (BGP), originated during this period of Internet history. BGP allowed routers on the NSFNET backbone to differentiate routes originally learned via multiple paths. Prior to BGP, interconnection between IP network was inherently hierarchical, and careful planning was needed to avoid routing loops.[21] BGP turned the Internet into a meshed topology, moving away from the centric architecture which the ARPANET emphasized.

45 Mbit/s (T-3) backbone[edit]

Packet Traffic on the NSFNET Backbone, January 1988 to June 1994

During 1991, an upgraded backbone built with 45 Mbit/s (T-3) transmission circuits was deployed to interconnect 16 nodes. The routers on the upgraded backbone were IBM RS/6000 servers running AIX UNIX. Core nodes were located at MCI facilities with end nodes at the connected regional networks and supercomputing centers. Completed in November 1991, the transition from T-1 to T-3 did not go as smoothly as the previous transition from 56 kbit/s DDS to 1.5 mbit/s T-1, as it took longer than planned. As a result, there was at times serious congestion on the overloaded T-1 backbone. Following the transition to T-3, portions of the T-1 backbone were left in place to act as a backup for the new T-3 backbone.

In anticipation of the T-3 upgrade and the approaching end of the 5-year NSFNET cooperative agreement, in September 1990 Merit, IBM, and MCI formed Advanced Network and Services (ANS), a new non-profit corporation with a more broadly based Board of Directors than the Michigan-based Merit Network. Under its cooperative agreement with NSF, Merit remained ultimately responsible for the operation of NSFNET, but subcontracted much of the engineering and operations work to ANS. Both IBM and MCI made substantial new financial and other commitments to help support the new venture. Allan Weis left IBM to become ANS's first President and Managing Director. Douglas Van Houweling, former Chair of the Merit Network Board and Vice Provost for Information Technology at the University of Michigan, was Chairman of the ANS Board of Directors.

The new T-3 backbone was named ANSNet and provided the physical infrastructure used by Merit to deliver the NSFNET Backbone Service.

Regional networks[edit]

This section **needs expansion** with: more detailed descriptions of the regional networks, the regions and organizations they served, and what happened to them. You can help by adding to it. *(September 2011)*

In addition to the five NSF supercomputer centers, NSFNET provided connectivity to eleven regional networks and through these networks to many smaller regional and campus networks. The NSFNET regional networks were:[11][22]

- BARRNet, the Bay Area Regional Research Network in Palo Alto, California;
- [CERFnet], California Education and Research Federation Network in San Diego, California, serving California and Nevada;
- CICNet, the Committee on Institutional Cooperation Network via the Merit Network in Ann Arbor, Michigan and later as part of the T-3 upgrade via Argonne National Laboratory outside of Chicago, serving the Big Ten Universities and the University of Chicago in Illinois, Indiana, Iowa, Michigan, Minnesota, Ohio, and Wisconsin;

- JVNCNet, the John von Neumann National Supercomputer Center Network in Princeton, New Jersey, connected the universities that made up the Consortium for Scientific Computing as well as a few New Jersey Universities. There were 1.5 Mbit/s (T-1) links to Princeton University, Rutgers University, Massachusetts Institute of Technology, Harvard University, Brown University, University of Pennsylvania, University of Pittsburgh, Yale University, The Institute for Advanced Study, Pennsylvania State University, Rochester Institute of Technology, New York University, The University of Colorado and The University of Arizona.[23]
- Merit/MichNet in Ann Arbor, Michigan serving Michigan, formed in 1966, still in operation as of 2013;[24]
- MIDnet in Lincoln, Nebraska the first NSFNET regional backbone to become operational in the Summer of 1986, serving Arkansas, Iowa, Kansas, Missouri, Nebraska, Oklahoma, and South Dakota, later acquired by Global Internet, which was acquired by Verio, Inc.;
- NEARNET, the New England Academic and Research Network in Cambridge, Massachusetts, added as part of the upgrade to T-3, serving Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont, established in late 1988, operated by BBN under contract to MIT, BBN assumed responsibility for NEARNET on 1 July 1993;[25]
- NorthWestNet in Seattle, Washington, serving Alaska, Idaho, Montana, North Dakota, Oregon, and Washington, founded in 1987;[26]
- NYSERNet, New York State Education and Research Network in Ithaca, New York;
- SESQUINET, the Sesquicentennial Network in Houston, Texas, founded during the 150th anniversary of the State of Texas;
- SURAnet, the Southeastern Universities Research Association network in College Park, Maryland and later as part of the T-3 upgrade in Atlanta, Georgia serving Alabama, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, South Carolina, Tennessee, Virginia, and West Virginia, sold to BBN in 1994; and
- Westnet in Salt Lake City, Utah and Boulder, Colorado, serving Arizona, Colorado, New Mexico, Utah, and Wyoming.

Commercial traffic[edit]

The NSF's appropriations act authorized NSF to "foster and support the development and use of computer and other scientific and engineering methods and technologies, primarily for research and education in the sciences and engineering." This allowed NSF to support NSFNET and related networking initiatives, but only to the extent that that support was "*primarily for research and education in the sciences and engineering.*"[27] And this in turn was taken to mean that use of NSFNET for commercial purposes was *not* allowed.

The NSFNET Backbone Services Acceptable Use Policy

June 1992[28]

General Principle

1. NSFNET Backbone services are provided to support open research and education in and among US research and instructional institutions, plus research arms of for-profit firms when engaged in open scholarly communication and research. Use for other purposes is not acceptable.

Specifically Acceptable Uses

2. Communication with foreign researchers and educators in connection with research or instruction, as long as any network that the foreign user employs for such communication provides reciprocal access to US researchers and educators.
3. Communication and exchange for professional development, to maintain currency, or to debate issues in a field or subfield of knowledge.
4. Use for disciplinary-society, university-association, government-advisory, or standards activities related to the user's research and instructional activities.
5. Use in applying for or administering grants or contracts for research or instruction, but not for other fundraising or public relations activities.
6. Any other administrative communications or activities in direct support of research and instruction.
7. Announcements of new products or services for use in research or instruction, but not advertising of any kind.
8. Any traffic originating from a network of another member agency of the Federal Networking Council if the traffic meets the acceptable use policy of that agency.
9. Communication incidental to otherwise acceptable use, except for illegal or specifically unacceptable use.

Unacceptable Uses

10. Use for for-profit activities, unless covered by the General Principle or as a specifically acceptable use.
11. Extensive use for private or personal business.

This statement applies to use of the NSFNET Backbone only. NSF expects that connecting networks will formulate their own use policies. The NSF Division of Networking and Communications Research and Infrastructure will resolve any questions about this Policy or its interpretation.

Acceptable Use Policy (AUP)[edit]

To ensure that NSF support was used appropriately, NSF developed an *NSFNET Acceptable Use Policy* (AUP) that outlined in broad terms the uses of NSFNET that were and were not allowed.[28] The AUP was revised several times to make it clearer and to allow the broadest possible use of NSFNET, consistent with Congress' wishes as expressed in the appropriations act.

A notable feature of the AUP is that it talks about acceptable uses of the network that are not directly related to who or what type of organization is making that use. Use from for-profit organizations is acceptable when it is in support of open research and education. And some uses such as fundraising, advertising, public relations activities, extensive personal or private use, for-profit consulting, and all illegal activities are never acceptable, even when that use is by a non-profit college, university, K-12 school, or library. And while these AUP provisions seem quite reasonable, in specific cases they often proved difficult to interpret and enforce. NSF did not monitor the content of traffic that was sent over NSFNET or actively police the use of the network. And it did not require Merit or the regional networks to do so. NSF, Merit, and the regional networks did investigate possible cases of inappropriate use, when such use was brought to their attention.[29]

An example may help to illustrate the problem. Is it acceptable for a parent to exchange e-mail with a child enrolled at a college or university, if that

exchange uses the NSFNET backbone? It would be acceptable, if the subject of the e-mail was the student's instruction or a research project. Even if the subject was not instruction or research, the e-mail still might be acceptable as private or personal business as long as the use was not extensive.[30]

The prohibition on commercial use of the NSFNET backbone[31] meant that some organizations could not connect to the Internet via regional networks that were connected to the NSFNET backbone, while to be fully connected other organizations (or regional networks on their behalf), including some non-profit research and educational institutions, would need to obtain two connections, one to an NSFNET attached regional network and one to a non-NSFNET attached network provider. In either case the situation was confusing and inefficient. It prevented economies of scale, increased costs, or both. And this slowed the growth of the Internet and its adoption by new classes of users, something no one was happy about.

In 1988, Vint Cerf, then at the Corporation for National Research Initiatives (CNRI), proposed to the Federal Networking Council (FNC) and to MCI to interconnect the commercial MCI Mail system to NSFNET. MCI provided funding and FNC provided permission and in the summer of 1989, this linkage was made. In effect, the FNC permitted experimental use of the NSFNET backbone to carry commercial email traffic into and out of the NSFNET. Other email providers such as Telenet's Telemail, Tymnet's OnTyme and CompuServe also obtained permission to establish experimental gateways for the same purpose at about the same time. The interesting side effect of these links to NSFNET was that the users of the heretofore disconnected commercial email services were able to exchange email with one another via the Internet. Coincidentally, three commercial Internet service providers emerged in the same general time period: AlterNet (built by UUNET), PSINet and CERFnet.

Commercial ISPs, ANS CO+RE, and the CIX[edit]

During the period when NSFNET was being established, Internet service providers that allowed commercial traffic began to emerge, such as Alternet, PSINet, CERFNet, and others. The commercial networks in many cases were interconnected to the NSFNET and routed traffic over the NSFNET nominally accordingly to the NSFNET acceptable use policy[32] Additionally, these early commercial networks often directly interconnected with each other as well as, on a limited basis, with some of the regional Internet networks.

In 1991, the Commercial Internet eXchange (CIX, pronounced "kicks") was created by PSINet, UUNET and CERFnet to provide a location at which multiple networks could exchange traffic free from traffic-based settlements and restrictions imposed by an acceptable use policy.[33]

In 1991 a new ISP, ANS CO+RE (commercial plus research), raised concerns and unique questions regarding commercial and non-commercial interoperability policies. ANS CO+RE was the for-profit subsidiary of the non-profit Advanced Network and Services (ANS) that had been created earlier by the NSFNET partners, Merit, IBM, and MCI.[34] ANS CO+RE was created specifically to allow commercial traffic on ANSNet without jeopardizing its parent's non-profit status or violating any tax laws. The NSFNET Backbone Service and ANS CO+RE both used and shared the common ANSNet infrastructure. NSF agreed to allow ANS CO+RE to carry commercial traffic subject to several conditions:

- that the NSFNET Backbone Service was not diminished;
- that ANS CO+RE recovered at least the average cost of the commercial traffic traversing the network; and
- that any excess revenues recovered above the cost of carrying the commercial traffic would be placed into an infrastructure pool to be distributed by an allocation committee broadly representative of the networking community to enhance and extend national and regional networking infrastructure and support.

For a time ANS CO+RE refused to connect to the CIX and the CIX refused to purchase a connection to ANS CO+RE. In May 1992 Mitch Kapor and Al Weis forged an agreement where ANS would connect to the CIX as a "trial" with the ability to disconnect at a moment's notice and without the need to join the CIX as a member.[35] This compromise resolved things for a time, but later the CIX started to block access from regional networks that had not paid the $10,000 fee to become members of the CIX.[36]

Meanwhile, Congress passed its Scientific and Advanced-Technology Act of 1992 [37] that formally permitted NSF to connect to commercial networks in support of research and education.

An unfortunate state of affairs[edit]

The creation of ANS CO+RE and its initial refusal to connect to the CIX was one of the factors that lead to the controversy described later in this article.[38] Other issues had to do with:

- differences in the cultures of the non-profit research and education community and the for-profit community with ANS trying to be a member of both camps and not being fully accepted by either;
- differences of opinion about the best approach to take to open the Internet to commercial use and to maintain and encourage a fully interconnected Internet; and
- differences of opinion about the correct type and level of involvement in Internet networking initiatives by the public and the private sectors.

For a time this state of affairs kept the networking community as a whole from fully implementing the vision for the Internet as a worldwide network of fully interconnected TCP/IP networks allowing any connected site to communicate with any other connected site. These issues would not be fully resolved until a new network architecture was developed and the NSFNET Backbone Service was turned off in 1995.[11]

Privatization and a new network architecture[edit]

The NSFNET Backbone Service was primarily used by academic and educational entities, and was a transitional network bridging the era of the ARPANET and CSNET into the modern Internet of today. With its success, the "federally-funded backbone" model gave way to a vision of commercially operated networks operating together to which the users purchased access.[39]

New network architecture, c. 1995

On April 30, 1995, the NSFNET Backbone Service had been successfully transitioned to a new architecture[40] and the NSFNET backbone was decommissioned.[41] At this point the NSFNET regional backbone networks were still central to the infrastructure of the expanding Internet, and there were still other NSFNET programs, but there was no longer a central NSFNET backbone or network service.

After the transition, network traffic was carried on the NSFNET regional backbone networks and any of several commercial backbone networks, internetMCI, PSINet, SprintLink, ANSNet, and others. Traffic between networks was exchanged at four Network Access Points or NAPs. Competitively

established, and initially funded by NSF, the NAPs were located in New York (actually New Jersey), Washington, D.C., Chicago, and San Jose and run by Sprint, MFS Datanet, Ameritech, and Pacific Bell.[42] The NAPs were the forerunners of modern Internet exchange points.

The NSFNET regional backbone networks could connect to any of their newer peer commercial backbone networks or directly to the NAPs, but in either case they would need to pay for their own connection infrastructure. NSF provided some funding for the NAPs and interim funding to help the regional networks make the transition, but did not fund the new commercial backbone networks directly.

To help ensure the stability of the Internet during and immediately after the transition from NSFNET, NSF conducted a solicitation to select a Routing Arbiter (RA) and ultimately made a joint award to the Merit Network and USC's Information Science Institute to act as the RA.

To continue its promotion of advanced networking technology the NSF conducted a solicitation to create a very high-speed Backbone Network Service (vBNS) which, like NSFNET before it, would focus on providing service to the research and education community. MCI won this award and created a 155 Mbit/s (OC3c) and later a 622 Mbit/s (OC12c) and 2.5 Gbit/s (OC48c) ATM network to carry TCP/IP traffic primarily between the supercomputing centers and their users. NSF support[43] was available to organizations that could demonstrate a need for very high speed networking capabilities and wished to connect to the vBNS or to the Abilene Network, the high speed network operated by the University Corporation for Advanced Internet Development (UCAID, aka Internet2).[44]

At the February 1994 regional techs meeting in San Diego, the group revised its charter[45] to include a broader base of network service providers, and subsequently adopted North American Network Operators' Group (NANOG) as its new name. Elise Gerich and Mark Knopper were the founders of NANOG and its first coordinators, followed by Bill Norton, Craig Labovitz, and Susan Harris.[46]

Controversy[edit]

For much of the period from 1987 to 1995, following the opening up of the Internet through NSFNET and in particular after the creation of the for-profit ANS CO+RE in May 1991, some Internet stakeholders[47] were concerned over the effects of privatization and the manner in which ANS, IBM, and MCI received a perceived competitive advantage in leveraging federal research money to gain ground in fields in which other companies allegedly were more competitive. *The Cook Report on the Internet*,[48] which still exists, evolved as one of its largest critics. Other writers, such as Chetly Zarko, a University of Michigan alumnus and freelance investigative writer, offered their own critiques.[49]

On March 12, 1992 the Subcommittee on Science of the Committee on Science, Space, and Technology, U.S. House of Representatives, held a hearing to review the management of NSFNET.[29] Witnesses at the hearing were asked to focus on the agreement(s) that NSF put in place for the operation of the NSFNET backbone, the foundation's plan for recompetition of those agreements, and to help the subcommittee explore whether the NSF's policies provided a level playing field for network service providers, ensured that the network was responsive to user needs, and provided for effective network management. The subcommittee heard from seven witnesses, asked them a number of questions, and received written statements from all seven as well as from three others. At the end of the hearing, speaking to the two witnesses from NSF, Dr. Nico Habermann, Assistant NSF Director for the Computer and Information Science and Engineering Directorate (CISE), and Dr. Stephen Wolff, Director of NSF's Division of Networking & Communications Research & Infrastructure (DNCRI), Representative Boucher, Chairman of the subcommittee, said:

> … I think you should be very proud of what you have accomplished. Even those who have some constructive criticism of the way that the network is presently managed acknowledge at the outset that you have done a terrific job in accomplishing the goal of this NSFNET, and its user-ship is enormously up, its cost to the users has come down, and you certainly have our congratulations for that excellent success.

Subsequently, the subcommittee drafted legislation, becoming law on October 23, 1992, which authorized the National Science Foundation

> … to foster and support access by the research and education communities to computer networks which may be used substantially for purposes in addition to research and education in the sciences and engineering, if the additional uses will tend to increase the overall capabilities of the networks to support such research and education activities (that is to say, commercial traffic).[50]

This legislation allowed, but did not require, NSF to repeal or modify its existing NSFNET Acceptable Use Policy (AUP)[28] which restricted network use to activities in support of research and education.[31]

The hearing also led to a request from Rep. Boucher asking the NSF Inspector General to conduct a review of NSF's administration of NSFNET. The NSF Office of the Inspector General released its report on March 23, 1993.[34] The report concluded by:

- stating that "[i]n general we were favorably impressed with the NSFNET program and staff";
- finding no serious problems with the administration, management, and use of the NSFNET Backbone Service;
- complimenting the NSFNET partners, saying that "the exchange of views among NSF, the NSFNET provider (Merit/ANS), and the users of NSFNET [via a bulletin board system], is truly remarkable in a program of the federal government"; and
- making 17 "recommendations to correct certain deficiencies and strengthen the upcoming re-solicitation."

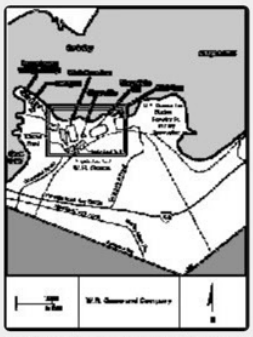
W. R. Grace & Co.



W. R. Grace and Company (FUSRAP Site) in Curtis Bay, Maryland

The W.R. Grace and Company is located on an industrialized peninsula in south Baltimore, Maryland. In the 1950's the W.R. Grace and Company milled thorium for the Atomic Energy Commission (AEC), a predecessor agency for the US Department of Energy. W.R. Grace began processing radioactive materials at the site in the 1950s, when Rare Earths, Inc. (W.R. Grace's predecessor) entered into a contract with AEC to extract thorium and rare earths from naturally-occurring monazite sands. Rare Earths' contract with AEC and its license to possess, transfer and use radioactive thorium were transferred to W.R. Grace and Company. Building 23, where the thorium processing took place, was open until the late 1950s when the contract was terminated. The wastes were buried in a landfill area. Thorium processing resulted in low-level waste that was buried on the property. Radiation surveys have shown that radioactive contamination still persists in the waste burial area, the waste management area which surrounds the waste burial plot, surfaces surrounding vats and hoppers in Building 23 and alpha-radiation surface contamination in the whole of Building 23. The site was designated by DOE for remedial action under the Formerly Utilized Sites Remedial Action Program (FUSRAP) in 1984. This site was one of the 21 Formerly Utilized Sites Remedial Action Program (FUSRAP) sites where cleanup responsibility was transferred to the US Army Corps of Engineers in 1997 in accordance with the Energy and Water Development Appropriations Act for FY 1998. Cleanup responsibilities transferred at that time from DOE-EM to the USACE.

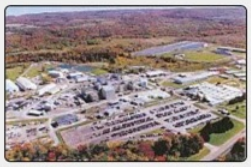
Cleanup responsibilities transferred at that time from DOE-EM to the USACE.

West Valley



1961 While industrial interests explore the viability of commercial reprocessing, the state of New York moves to acquire land in the town of Ashford, near West Valley, for an atomic industrial area. The state Office of Atomic Development establishes the Western New York Nuclear Service Center (WNYNSC) on the 3,345 acres of land it has taken title to.

1962 Davison Chemical Company establishes Nuclear Fuels Services, Inc. (NFS) as a reprocessing company. It reaches an agreement with the state to lease the WNYNSC.

1966 Nuclear Fuels Services develops and operates 200 acres of the WNYNSC. It operates the site as a nuclear fuel reprocessing center from 1966 to 1972, and accepts radioactive waste for disposal until 1975. During the operation of the plant, 640 metric tons of spent reactor fuel are processed, resulting in 660,000 gallons of highly radioactive liquid waste. The liquid waste is stored in an underground waste tank. NFS also utilizes a 15-acre area for the disposal of radioactive waste from commercial waste generators, and another seven-acre landfill is used to dispose of radioactive waste generated from reprocessing.

1976 Following four years of pursuing modifications to the plant, NFS decides the costs and regulatory requirements of reprocessing make the venture impractical. The company decides to exercise its right to leave the site after its lease expires on December 31, 1980, transferring ownership and responsibility for the waste and facility to the state of New York. The state initiates talks with the Federal Energy Research and Development Administration to sort out ownership of the waste and environmental remediation responsibility.

1980 Congress passes the West Valley Demonstration Project Act, Public Law 96-368, directing the U.S. Department of Energy (DOE) to take the lead role in solidifying the liquid high-level waste and decontaminating and decommissioning the facilities at West Valley.

History

See 2007-04-07-tn-times-news-nuclear-fuel-services-celebrates-50th-birthday.pdf / https://drive.google.com/open?id=1tsW8c4gjhyJcgf38aWC5aJ30hh7pUNjc

ERWIN - Much of the activity in its production plant is shrouded in secrecy, but Unicoi County's largest employer doesn't want one piece of news to be classified: It has turned 50 this year.

Nuclear Fuel Services, which manufactures fuel for the Navy and converts highly enriched uranium into fuel used at the Tennessee Valley Authority's Browns Ferry nuclear power plant, has hit the half-century mark.

The industry plans to celebrate the anniversary in July, but it briefly commemorated the event at the Unicoi County Chamber of Commerce dinner last month.

NFS was born in 1957 in Baltimore when T.C. Runion, Charlie Taylor, Stan Reese and Ed Johnson hooked up with companies W.R. Grace and Davison Chemical, fueled in part by a desire by Congress to have commercial nuclear power plants.

W.R. Grace bought Davison in 1954, NFS spokesman Tony Treadway said.

"We've made a real contribution to society and the business world," said Taylor, who remained active in company affairs until he resigned from the board of directors in February.

According to a company brochure, the four men were working for National Lead Co. in Fernald, Ohio, when their lives intersected.

"We knew that W.R. Grace was wanting to grow into the nuclear business and that Davison Chemical made a lot of specialty chemicals, so we went to them for financial backing," Johnson said.

The choice of building NFS in Erwin was a matter of logic and personal feelings. Runion said the town was close to Oak Ridge and Savannah River, a Department of Energy site close to Aiken, S.C., and a railroad siding could be obtained for the Erwin property. Plus, Erwin was his hometown.

Taylor said the early years consisted of processing highly enriched uranium, low-enriched uranium and thorium metal. During down times, NFS made specialty chemicals. Later, NFS manufactured material for Consolidated Edison's first commercial nuclear reactor.

The company's most well-known role with the military evolved from the Navy's wishes to have a fleet of nuclear powered ships. NFS has been the sole provider of Navy fuel since 1966, and the first batch arrived at an aircraft carrier in 1969.

"We wanted to penetrate the Navy business, so NFS and W.R. Grace went to work on a better type of fuel completely on our own and without government support," Johnson said. "It was a really gutsy thing to do."

Runion recalled that he worked at the Erwin plant for 10 years, all of which he believed were profitable. He said that is unusual in the nuclear industry.

"Most of all the companies took a beating the first two or three years," said Runion, who noted that everyone involved in establishing NFS believed that nuclear business "was going to be the way to go."

He said NFS was one of the first plants to produce uranium oxide as part of the fuel that nuclear power electric generating plants needed. The material used in Erwin was manufactured at a government plant in Oak Ridge, Runion said.

At the moment, NFS has about 540 employees, with more than 340 on salary and the rest being hourly, union employees.

Other union members are gradually returning to work after last year's strike ended. Employment was at its highest about 1,200 in the late 1980s and early 1990s.

Despite a connection to the U.S. government that keeps many aspects of its operation top secret, NFS has found itself regularly in the news over the years.

Sometimes, it's been the result of labor unrest. Occasionally, the union has gone on strike, the last one coming in 2006 and lasting five months. In 1985 and 1986, a strike lasted nearly a year. Taylor said NFS has probably had more problems with its union than other companies have encountered.

Roger Birchfield, who worked for NFS for 40 years before retiring in 2006 and was union president during the recent strike, said he believes unions are good for a company and employees because it provides a structure by which both can work. He said it is important, especially in a nuclear plant, to have an organization to follow up on safety issues.

Periodically, NFS has found itself in trouble with the Nuclear Regulatory Commission. The federal agency fined NFS $10,000 in 1985 for what was called a "dangerous buildup of uranium" in the plant's air vents.

The NRC shut down the plant in 1979 when NFS could not account for 19.8 pounds of uranium. After the company was able to document most of the uranium, the NRC allowed the plant to reopen.

In 1996, an NFS incinerator caught fire, but it caused no injuries or radiation contamination, company officials said.

One of the toughest periods for the company began in 1992 when the Navy canceled its contract with NFS because its fuel needs dropped as the Cold War ended. Taylor recalled that as one of the dark periods for the company as employment plummeted by more than half from 800. NFS regained the contract in 1996.

When NFS lost its contract with the Navy, the company did not think it was on its last legs because it knew that branch of the military would need fuel again, Treadway said. But he said the company realized it "needed to be more aggressive in new business development."

DOE Western NY Nuclear Service Center

See 1978-11-us-doe-western-ny-nuclear-service-center-report-vol1 / https://drive.google.com/open?id=1u2oFRSwcQvei0LPCue9gYzw3A_z0O61Q

1.1 HISTORY

A stated purpose of the Atomic Energy Act of 1954 was to promote "wide spread participation in the development and utilization of atomic energy for peaceful purposes." The Atomic Energy Commission (AEC) actively encouraged private industry to enter the field of nuclear power. By the end of 1955, the AEC concluded agreements for the first few demonstration power reactors.

In 1954, the AEC began a program to encourage private participation in the reprocessing of irradiated nuclear fuel as part of its program to commercialize the entire nuclear fuel cycle. To have commercial reprocessing services available for the first irradiated fuel in 1961, the AEC offered to make available the reprocessing technology developed for the defense program.

In 1959, New York State's interest in attracting atomic development culminated in the formation of the Office of Atomic Development (OAD) as an independent agency responsible for coordination of atomic regulatory and development functions within the State. To encourage nuclear development, the OAD acquired the West Valley site in 1961, which became designated the Western New York Nuclear Service Center (WNYNSC). The purpose of the Center was to store nuclear fuels and radioactive wastes and to be available for related industrial development.

The **Davison Chemical Co.** was sufficiently encouraged by the developments in the late 1950's to consider the feasibility of constructing a reprocessing facility. In 1961, Davison expressed interest in operating the WNYNSC. January 1962, Davison outlined its plans to the AEC for constructing a In private reprocessing plant. To pursue the reprocessing venture, Davison set up Nuclear Fuel Services, Inc. (NFS), whose stock was owned by the W. R. Grace Co. (78%) and American Machine and Foundry (22%). NFS, in its proposal, indicated its willingness to provide and maintain storage for a limited period of time for the high-level liquid wastes (HLLW)t resulting from the reprocessing operations. Subsequently, the wastes would become the responsibility of the AEC. NFS also said it was willing to collect and return to the AEC an amount calculated to provide the estimated full costs for perpetual storage at the point of turnover. NFS was simultaneously negotiating to make New York State responsible for perpetual care of the was tes. The proposed, and eventually approved, method of waste disposition was to store them in liquid form in underground storage tanks, similar to the method being used at AEC production facilities.

HISTORY OF WEST WALLEY

See 1979-us-doe-western-ny-nuclear-service-center-companiion-report-vol2.pdf / https://drive.google.com/open?id=1u94lpBjuojDHVlTaqgNtJwm_avkOvsyy

1. 1

A stated purpose of the Atomic Energy Act of 1954 was to promote "wide-spread participation in the development and utilization of atomic energy for peaceful purposes." The Atomic Energy Commission (AEC) actively encouraged private industry to enter the field of nuclear power. By the end of 1955, the AEC concluded agreements for the first few demonstration nuclear power reactors.

In 1954, the AEC began a program to encourage private reprocessing of irradiated nuclear fuel as part of its program to commercialize the entire nuclear fuel cycle. By January 1956 this program resulted in an announcement by the AEC that:

• The AEC would make available to industry AEC technology on reprocessing and the description of fuels available for reprocessing

• The AEC invited proposals by industry to design, reprocessing plants construct, and operate

• The AEC would provide assistance in the form of a baseload and allow the use of AEC facilities for development work and training.

During discussions of this program with industry, three predominant issues were raised. The first was the lack of adequate demand to make a commercial reprocessing plant economically viable. The AEC offered to provide a baseload of fuel from its production reactors to support the plant until adequate demand developed.

The second predominant issue was the lack of a basis for establishing reason able charges for services. In 1957, the AEC announced a policy to assure that reprocessing services would be available for the first commercial irradiated fuel in 1961. Under this policy, the AEC would provide fuel reprocessing services in AEC facilities until services were available commercially at reasonable prices or until June 30, 1976. To establish charges for those services, the AEC designed a hypothetical reprocessing plant. The reasonableness of commercial charges was to be based on comparison with these hypothetical plant charges.

The third predominant issue was responsibility for the high-level radioactive wastes resulting from commercial reprocessing. The AEC policy was to encourage the maximum participation of industry in the management of these wastes. It was recognized that industrial longevity was insufficient to assume ultimate responsibility for these wastes. For West Valley, this factor was overcome by having ownership of the land reside with the State.

Perceiving an opportunity to promote industrial development within the State, New York, in 1956, had created a State Council on the Development of Atomic Energy, followed by the formation of the Office of Atomic Development (OAD) in 1959. In 1961, OAD acquired a 1350-hectare (ha) (3345-acre) site near the hamlet of West Valley in the Town of Ashford, Cattaraugus County, about 48 km (30 miles) south of Buffalo. The site was judged to be favorable for a nuclear fuel reprocessing plant and attendant waste facilities. It was favorably located with respect to projected nuclear reactor development in the north eastern and mid-Atlantic United States. In addition, the silty till in the West Valley area was relatively impermeable to water and would, therefore, provide protection against migration of waterborne radioactivity through the ground. Further advantages of the site were a low population density in the area and meteorological conditions favorable for atmospheric dilution of any radioactivity released. The site was named the Western New York Nuclear Service Center (WNYNSC); it is also referred to as West Valley or the Center.

The developments of the late 1950s were sufficiently encouraging for utility and industrial concerns to form the Industrial Reprocessing Group (IRG). The IRG, composed of Davison Chemical, Consolidated Edison, Commonwealth Electric, and Northern States Power, in 1ate 1959 initiated a technical and economic feasibility study of reprocessing. As a result of IRG's interest, the AEC delayed indefinitely the modification of facilities planned for processing commercial fuel, but would continue to receive fuels for which reprocessing capability did not exist or charges were not reasonable.

In 1961, the Davison Chemical Company expressed interest in the West Valley site. In January 1962, Davison outlined its plans to the AEC for constructing a private reprocessing plant. To pursue the reprocessing venture, Davison (which was acquired by W. R. Grace and Company) set up Nuclear Fuel Services, Inc. (NFS). W. R. Grace owned 78% of the NFS stock and American Machine and Foundry owned the rest.

NFS indicated its willingness to provide and maintain storage for a limited period of time for the high-level 11quid wastes resulting from the reprocessing operations. Subsequently, the wastes would become the responsibility of the AEC. NFS also said it was willing to collect and return to the AEC an amount of money calculated to provide the estimated full costs for perpetual storage at the point of turnover. NFS was simultaneously negotiating to make New York State responsible for perpetual care of the wastes. The proposed, and eventu ally approved, method of waste disposition was to store the wastes in liquid form in underground storage tanks, similar to the method being used at AEC production facilities

1982 (July 18)

10A Sun., July 18, 1982 ST LOUIS POST-DISPATCH

Cleanup Is Begun Of Nuclear Fuel Reprocessing Waste

By Matthew L. Wald
©1982, New York Times News Service

WEST VALLEY, N.Y. — In a sealed carbon-steel tank, encased in a concrete vault 8 feet underground, are 660,000 gallons of poisonous waste that were produced by the only commercial nuclear-fuel reprocessing plant ever to operate in the United States.

The liquid will be dangerously radioactive for thousands of years; the tank has a life expectancy of 40.

The problem has resisted years of negotiations, lawsuits, agreements, disagreements, and renegotiations between the former plant operators, the state and the federal governments, and public officials and private citizens. People in the West Valley area, 30 miles southeast of Buffalo in western New York, have been concerned about the problem for years.

But the federal Department of Energy has now released its recommendation. Workers have begun the first stages of a clean-up.

The department is to issue a final ruling in September. It now recommends that the liquid be solidified to make it more stable. It would then be shipped for storage to a site yet to be chosen.

The waste is the byproduct of a chemical process that extracts uranium and plutonium from the used fuel produced by nuclear power plants around the country. The extractions were carried out for six years by a private company operating in West Valley, Nuclear Fuel Services. The plant was closed for renovation in 1972; it never reopened.

Such reprocessing was later banned by the Carter administration. Used fuel still in the original fuel rods is now stored in pools at the reactors where it is produced. That fuel also poses a long-term waste problem. But it is not as unstable as the liquid wastes.

But the West Valley plant's legacy endures. It has been inherited by the residents in the form of thousands of tons of material that will be radioactive for generations, spread over 300 acres of underground tanks, trenches, and wells of varying stability. The closed factory is heavily contaminated.

How much must be done to contain the poisons and how much it will cost are not yet clear.

The solidification project also involves the contents of a second, smaller tank nearby. It is supposed to be completed around the end of the century. The sponsors are the Department of Energy and the New York state Energy Resource Development Authority — but the agencies have little idea of what it will cost.

The Department of Energy's solution would be to mix the radioactive waste with glass. The glass would be surrounded by some other material that could protect the glass from corrosive elements for 1,000 years.

The price of solidification was put at $130 million in a federal study done in 1978. When an agreement was reached two years later calling for the federal government to pay 90 percent of the cost, the cost estimate had jumped to $285 million.

When the site was turned over to the Energy Department early this year, the cost was estimated at $400 million. Westinghouse Electric Corp., the contractor involved, now estimates that it will cost "under $500 million." The job is still in the "design" stage.

There are also questions about whether the glass is compatible with salt — now favored as the permanent storage medium — and about the glass-mixing process. The process may allow some radioactivity to escape into the environment.

Small amounts of radioactivity have already leaked at the site from a waste dump with low-level radioactivity. Some leaks came from the plant while the reprocessing was going on. Traces of radioactivity remain on the rolling farmland and in the beds of nearby streams.

The liquid wastes containing high-level radioactivity are far more toxic than the wastes that have leaked. It is imperative that the liquid wastes be stabilized before they start leaking, experts say.

The West Valley cleanup project does not include the decontamination of the site or any substantial work on the 15-acre waste burial ground that has already leaked and now requires monitoring and maintenance. That dump will continue to require surveillance for at least the next 300 years, experts say.

The dump consists of 600-foot-long trenches filled with mildly radioactive materials in steel drums, wooden crates, and cardboard boxes. It is unstable. The soil on top of the dump has cracked as the material inside has settled, allowing rainwater in.

Several trenches have been filled in because water flows poorly in the soil around them, resulting in a "bathtub effect." Water bearing traces of radioactivity broke through the top of one trench in 1975 and flowed into the open.

The burial ground was closed after that incident. Workers since that time have monitored the level of water in the trenches, pumped them out and filtered radioactive particles from the water. The radioactivity is then reburied. But on at least on occasion, radioactive water has accidentally spilled.

The dump includes 12 pounds of plutonium, a deadly and long-lived radioactive element. But most of the material will lose nearly all of its radioactivity in the next 300 years. Maintenance will not be necessary after that time.

New York state licensed the burial ground but it has no plans for the dump. State officials note that more cover has been added to the top of the trenches. They are now mowed and inspected regularly and erosion in the area of the trenches has been repaired.

Nuclear Fuel Services

From Wikipedia, the free encyclopedia

Jump to navigation
Jump to search

Nuclear Fuel Services Inc. (NFS) is an American company that has been a major supplier of fuel for the United States Navy's fleet of nuclear-powered vessels since the 1960s. In recent years it has also reprocessed weapons-grade uranium into nuclear reactor fuel. It operates a 65-acre (260,000 m^2) gated complex in Erwin, Tennessee.[1] NFS is a subsidiary of BWX Technologies, Inc.

The company has emerged as America's leader in converting surplus weapons-grade uranium from U.S. Cold War stockpiles into valuable low-enriched uranium fuel material to power commercial nuclear power plants. Known as downblending, the proprietary NFS process is currently being used to convert about 40 metric tons of highly enriched uranium (HEU) into fuel material for the Tennessee Valley Authority. In 2007, the company was also awarded a contract by the U.S. Department of Energy's (DOE) National Nuclear Security Administration to convert 17.4 metric tons of HEU into material for America's Reliable Fuel Supply Program.

The company's downblending is also an important resource for the round up of other nuclear materials around the world to reduce the chance of proliferation by rogue nations or terrorists. NFS is also engaged as a team member at important nuclear projects at other DOE sites, such as the Mixed Oxide (MOX) Fuel Fabrication Facility at Savannah River and the cleanup of an old laboratory at the Oak Ridge National Laboratory.

Recent NRC Events[edit]

On May 11, 2008, the Nuclear Regulatory Commission released information on emergency notification of two 2006 incidents at the Erwin plant. The first incident involved a leak of liquid containing highly enriched uranium, which could have resulted in a criticality incident.[2]

The second incident involved an unmanaged 'accumulation point' - where a critical mass of uranium could have accumulated - was discovered while reacting to the first incident. In other words, no system protections were in place to prevent a solution leak from entering the bottom of an elevator shaft in the plant. The result of material accumulated in a confined space could be a criticality incident [3]

History United States

Name:

O'Bannon

Namesake:

First lieutenant Presley O'Bannon

Builder:

Bath Iron Works

Laid down:

3 March 1941

Launched:

19 February 1942

Commissioned:

26 June 1942

Decommissioned:

30 January 1970

Struck:

30 January 1970

Fate:

Sold for scrap, 6 June 1970

General characteristics

Class and type:

Fletcher-class destroyer

Displacement:

2,050 tons

Length:

376 ft 6 in (114.7 m)

Beam:

39 ft 8 in (12.1 m)

Draft:

17 ft 9 in (5.4 m)

Propulsion:

60,000 shp (45 MW); 2 propellers

Speed:

35 knots (65 km/h; 40 mph)

Range:

6500 nmi. (12,000 km) at 15 kt

Complement:

329

Armament:

- 5 × 5 in (127 mm)/38 cal. guns
- 10 × 40 mm AA guns
- 7 × 20 mm AA guns
- 10 × 21 in (533 mm) torpedo tubes
- 6 × depth charge projectors
- 2 × depth charge tracks

USS *O'Bannon* (DD/DDE-450), a *Fletcher*-class destroyer, was the second ship of the United States Navy to be named for Lieutenant Presley O'Bannon (1784–1850), the Marine Corps's "hero of Derna".

O'Bannon was laid down by Bath Iron Works Corp. in Bath, Maine on 3 March 1941, and launched 19 February 1942, sponsored by Mrs. E. F. Kennedy, descendant of Lieutenant O'Bannon. *O'Bannon* and her sister ship *Nicholas* (DD-449) were the first two *Fletcher*s to be launched. *O'Bannon* was commissioned at Boston on 26 June 1942, Commander Edwin R. Wilkinson in command.[1]

O'Bannon was the US Navy's most decorated destroyer during World War II, earning 17 battle stars and a Presidential Unit Citation.

1942

O'Bannon briefly trained for war in the Caribbean and sailed from Boston on 29 August 1942 for the Southwest Pacific, where the long and arduous Guadalcanal campaign had just begun. For over a year, the Navy—stretched thin to cover its worldwide commitments at a period when new ships were just beginning to join the fleet in any number—was to fight and fight again in the Solomon Islands in one of the most bitterly contested campaigns of history, wresting air and sea control from the Japanese and providing the Marine Corps and the Army with every possible support as they gained ground inch by inch on the myriad islands. Assigned the Destroyer Squadron 21 (DesRon 21), *O'Bannon* played a valiant part in these endeavors, winning a Presidential Unit Citation.[1]

Based at Nouméa, New Caledonia, *O'Bannon* first escorted the escort carrier *Copahee* on a run to Guadalcanal, where on 9 October, twenty Marines flew their Grumman F4F Wildcats off *Copahee*'s decks, desperately needed as reinforcements at beleaguered Henderson Field. Through the remainder of the month, *O'Bannon* sailed the New Hebrides and southern Solomons on escort duty. On 7 November at Nouméa, she joined Rear Admiral Daniel J. Callaghan's Support Group, ready to sail with a convoy carrying critical reinforcements, replacements, food, ammunition, and aviation material.[1]

On the approach to Guadalcanal, *O'Bannon* sighted and fired on a surfaced enemy submarine, holding it down while the convoy passed safely. On the afternoon of 12 November, the partially unladen transports were attacked by sixteen enemy torpedo bombers; eleven were shot down. *O'Bannon* fired on four of the enemy planes.[1]

Now came word that the Japanese were moving south in force. Two battleships, a light cruiser, and 14 destroyers were bound to destroy Henderson Field by bombardment, to break up the American reinforcement mission, and to cover reinforcement movements of their own. *O'Bannon* and the other ships of the Support Force, two heavy and three light cruisers and eight destroyers, confronted the greatly superior enemy early on 13 November in Ironbottom Sound, so named for the number of ships on both sides sunk there during the Guadalcanal campaign. *O'Bannon* boldly attacked the Japanese battleship *Hiei*, closing so near, the battleship could not depress her main battery far enough to fire on the destroyer. *O'Bannon*'s gunfire, in combination with the attacks of the rest of the force, damaged *Hiei* so badly that she was a sitting duck for the air attack, which forced her scuttling the next day.[1]

This first engagement of the Naval Battle of Guadalcanal was short but furious; two American light cruisers, in one of which Rear Admiral Norman Scott lost his life, and four destroyers were lost, while two Japanese destroyers were sunk, and *Hiei* prepared for her doom. Above all, the Japanese were turned back, and Henderson Field was saved from destruction. The importance of this success is illustrated by the fact that the next day, Henderson aviators sank eleven enemy troop transports attempting to reinforce the island.[1]

Through October 1942, *O'Bannon* protected landings, carried out escort duties from Nouméa and Espiritu Santo to Guadalcanal and Tulagi, joined in bombardments at Guadalcanal, Munda, and Kolombangara, and shouldered her share of the nightly patrols up "the Slot", guarding against Japanese reinforcements.[1]

1943

Plaque commemorating the Potato incident

A Navy legend holds that in April *O'Bannon* sighted a Japanese submarine on the surface and opened fire. The submarine pulled alongside the destroyer close enough that the destroyer's guns could not hit it. Several different versions of the story say that the sailors on the destroyer pelted the submarine crew with potatoes.[2] Commander Donald MacDonald only said that the submarine was so close, the destroyer's cook believed that he could throw a potato at it. Although MacDonald has repeatedly claimed that no potatoes were actually thrown, the story of an American destroyer sinking a Japanese submarine with potatoes was picked up by the media and was so quickly spread throughout navy lore that many still believe it to this day.[3] A plaque commemorating the incident was on display at the Maine Maritime Museum until the 1970s but then went missing.[2]

War duty was tense and demanded the best of men and their ships. In-port time was minimal; a few hours to fuel and reprovision, and the ships were off again. *O'Bannon* fought in many surface actions. The Battle of Kula Gulf (6 July), in which *O'Bannon* fought with three cruisers and three other destroyers against ten Japanese destroyers, swept the enemy from the area, though an American cruiser was lost. A week later, the Battle of Kolombangara had to be fought in the same waters against a Japanese cruiser, five destroyers and four destroyer escorts. The same American force sank the Japanese cruiser *Jintsu* and turned the smaller ships away,[1] losing one destroyer themselves and having three cruisers damaged.[4]

O'Bannon (right) and *Selfridge* after the Battle of Vella Lavella, 1943

For the next two months, *O'Bannon* spent most of her time in Vella Gulf, guarding landings, intercepting Japanese troop convoys and their covering escorts, and fighting off air attacks. With the aid of sister destroyers, she sank a number of barges, two submarine chasers, an armed boat, and a gunboat on various patrols. The climax of operations in the area was the Battle of Vella Lavella on 6 October, brought on by Japanese attempts to evacuate their troops from that island. With the destroyers *Selfridge* and *Chevalier*, *O'Bannon* made the first attack on the evacuation force, a group of nine or ten destroyers and smaller armed craft. The three American ships contacted six enemy destroyers, shrugged at the odds, and raced at 33 knots (61 km/h) to launch torpedoes and open gunfire. The Japanese destroyer *Yūgumo* was turned into a blazing hulk, but both *Selfridge* and *Chevalier* took torpedo hits. *O'Bannon* was close on *Chevalier*'s stern when the latter was struck, and the most radical maneuvers could not keep her from swinging into her sister's side. The enemy retired with three newly arrived American destroyers in pursuit, while *O'Bannon* guarded her stricken sisters, rescuing the survivors of *Chevalier*.[1]

1944

O'Bannon made battle repairs at Tulagi, then sailed to the west coast for overhaul. By 18 March 1944, she was back in the Solomons, ready for her part in the series of westward-moving amphibious assaults that won New Guinea. Again, it was escort and bombardment repeatedly until 18 October, when *O'Bannon* cleared Hollandia to escort reinforcements for the invasion of Leyte. The convoy was brought in safely on 24 October, the eve of the Battle for Leyte Gulf. *O'Bannon* guarded the Northern Transport area and patrolled the entrances to Leyte Gulf during the battle, coming under air attack. Thus, she played her part in the definitive destruction of the Japanese Navy.[1]

1945

Through June 1945 *O'Bannon* operated primarily in the Philippines, serving in the escort or assault force for the long roll call of invasions: Ormoc Bay, Mindoro, Lingayen Gulf, Bataan, Corregidor, Palawan, Zamboanga, Cebu, and Caraboa. Air attacks were frequent in the early period, and *O'Bannon* splashed several raiders. During the Lingayen offensive on 31 January 1945, *O'Bannon*, with three other destroyers, attacked and sank an enemy submarine; Japanese records studied after the war indicate it was most likely *Ro-115*. At the end of April and early in May, *O'Bannon* interrupted her Philippine operations to give fire support at Tarakan, Borneo, and cover minesweeping operations there.[1]

O'Bannon rendezvoused with a group of escort carriers off Okinawa on 17 June and guarded them as they struck against Sakishima Gunto. In July, she protected the large carriers as they flew strikes on northern Honshū and Hokkaidō. With the close of the war, *O'Bannon* patrolled the coast of Honshū until 27 August, when she joined the destroyers *Nicholas* and *Taylor* to escort the battleship *Missouri* into Tokyo Bay, by order of Admiral William Halsey, "because of their valorous fight up the long road from the South Pacific to the very end." There, she patrolled until 1 September. She then sailed to San Francisco and San Diego, where she was decommissioned after overhaul on 21 May 1946.[1]

1949–1962

O'Bannon leads *Chevalier* and *Taylor*, August 1943

Between 17 January 1949 and 10 February 1950, *O'Bannon* was converted to an escort destroyer at Long Beach Naval Shipyard. She was redesignated **DDE-450** on 26 March 1949.[1]

O'Bannon was recommissioned on 19 February 1951 to serve out of Pearl Harbor. She sailed for her first tour of duty with the United Nations forces repelling Communist aggression in Korea on 19 November, and, during the next seven months, she guarded carriers at sea as their air groups struck targets in Korea; served as flagship for the Wonsan Element, East Coast Blockade and Escort Group; fired on enemy gun emplacements, road and rail supply routes, ammunition depots, and troop concentrations; and protected convoys moving between Korea and Japan.[1]

A training period out of Pearl Harbor began upon her return home on 20 June 1952, and she took part in U.S. Atomic Energy Commission operations off Eniwetok. *O'Bannon* cleared Pearl Harbor late in April 1953 for the Far East, where her primary mission was screening carriers. Thereafter, she served on the Taiwan Patrol and in exercises off Japan and Okinawa.[1]

Between the Korean War and the Vietnam War, *O'Bannon* took her part in the intricately planned schedule that assured the United States that its 7th Fleet was always composed of ships and men whose readiness for any emergency was at its keenest. For *O'Bannon*, this meant an alternation of roughly six-month deployments to the Far East and periods spent in training operations and necessary overhauls at Pearl Harbor. While in the Far East, she visited ports in Japan, the Philippines, Taiwan, Australia and New Zealand, with brief welcome recreation calls at Hong Kong. She was often in either New Zealand or

Japan, the Philippines, Taiwan, Australia and New Zealand, with brief, welcome recreation calls at Hong Kong. She was often in either New Zealand or Australia for the annual commemoration of the Battle of the Coral Sea, a time of national rejoicing in those countries at which Americans are particularly welcome. She conducted combined operations training with the SEATO allies as well as exercising with Marines at Okinawa and taking part in exercises preparing for any conceivable demand that might be made on the 7th Fleet. While at Pearl Harbor, she often aided in training reservists in addition to her own training and, at various times, sailed down-range for space orbits and missile shots. In the summer and fall of 1962, she took part in atomic tests at Johnston Island.[1]

1964–1970

In 1964, *O'Bannon* took part in the 1965 film *In Harm's Way*.

O'Bannon first closed the coast of Vietnam during her 1964–65 deployment, when, on 26 December, she left Hong Kong to patrol and conduct hydrographic surveys. Much of her 1966 tour was spent as plane guard for the aircraft carrier *Kitty Hawk*, while the carrier's jets struck targets in South and North Vietnam to lessen Communist ability to wage war in the South. For a week each in May and June, *O'Bannon* fired shore bombardments, destroying Vietcong base camps, troop concentrations, and small craft.[1]

The veteran destroyer returned via Yokosuka to Pearl Harbor on 30 July. During operations out of home port, she trained for Apollo space craft recovery operations in August and was a member of the contingency recovery force for the Gemini 11 space flight early in September. She visited Guam in the spring of 1967 and returned home early in July to prepare for another Far Eastern deployment.[1]

O'Bannon (right) as part of TG 76.5 off Vietnam in March 1965

O'Bannon got under way for Japan on 28 September and reached Yokosuka on 7 October and Subic Bay on the 15th. She returned to the war zone with the carrier *Constellation* and operated as plane guard on Yankee Station through 4 November. After a fortnight's respite at Subic Bay and Hong Kong, *O'Bannon* sailed to Da Nang for shore bombardment. She visited Taiwan early in December but returned to the fighting on the 15th to provide gunfire support just south of the DMZ. Two days later, she helped to rescue the crew of an American plane that had been hit over the DMZ and had managed to crash just off shore. An enemy battery shelled the destroyer during the operation but failed to score. As 1967 ended, *O'Bannon* was still on the gun line supporting allied ground forces.[1]

On 30 January 1970, *O'Bannon* was decommissioned in a ceremony at Pearl Harbor (side-by-side with her sister *Nicholas*, as at their launching)[*citation needed*] and stricken from the Navy List. She was sold for scrap on 6 June 1970 and broken up two years later.[5]

O'Bannon received the Presidential Unit Citation and 17 battle stars for World War II service, placing her among the most decorated US ships of World War II. She also received three more battle stars for service during the Korean War.[1] Nicknamed the "*Lucky O*", none of her crew was awarded the Purple Heart.[*citation needed*]

Quotes

The history of the Pacific war can never be written without telling the story of the U.S.S. *O'Bannon*. Time after time the *O'Bannon* and her gallant little sisters were called upon to turn back the enemy. They never disappointed me.

— Admiral William F. Halsey.[6]

Description

This application claims priority from U.S. Provisional Patent Application Ser. No. 60/019,089, filed May 14, 1996, naming as inventors Thomas Obenhuber and Rodney Joffe, and assigned to the assignee of the instant application. U.S. Provisional Patent Application Ser. No. 60/019,089 is incorporated by reference herein in its entirety for all purposes.

BACKGROUND OF THE INVENTION

The present invention relates to computer networking systems and, more particularly, to systems and methods of providing Internet access to multiple users at a single location.

The Internet is a collection of thousands of computer networks around the globe. Internet usage has grown exponentially since 1993, mainly due to the world wide web (Web) and its electronic mail (e-mail) and web page capabilities. This interconnection of computers is possible because the Internet has adopted a communication standard (Transmission Control Protocol/Internet Protocol or TCP/IP) which allows computers with different operating systems to communicate with each other over a network of networks (an "internetwork").

By one estimation, over 8 million computers currently attach to the Internet. An estimated 40 million users worldwide access these computers ("hosts").

Corporations and private users increasingly demand easy, cost-effective, and high-speed (e.g., greater than 1 megabits per second or Mbps) access to public interoperable networks such as the Internet. Around the world, the demand for a technical infrastructure for building private networks on top of public networks also is increasing.

As the number of users on the Internet increases, so too do the users grow more sophisticated. Users are demanding greater bandwidth to support this sophistication.

In conventional systems a user might use several different suppliers and components to achieve connectivity and security. The user then has to change equipment and software protocols during his migration from a lower bandwidth (e.g., 56 kilobits per second or kbps) to a higher bandwidth (e.g., 1 Mbps or higher).

Accordingly, there is a need for a substantially simplified infrastructure to access public networks with a reduced number of components, a reduced number of software protocols, enhanced management capabilities for network components, and secure access to the public network.

SUMMARY OF THE INVENTION

The present invention provides systems and methods for providing multiple users with access to a public network like the Internet. A single high-bandwidth connection (e.g., fast Ethernet) allows the multiple users to communicate with the public network. Each user is allocated a specific bandwidth, and the user is able to freely communicate with the public network up to the allocated bandwidth. Additionally, the invention may be remotely configured to change bandwidth allocations. [...]

MULTI-TENANT UNIT

This application claims priority from U.S. Provisional Patent Application Ser. No. 60/019,089, filed May 14, 1996, naming as inventors Thomas Obenhuber and Rodney Joffe, and assigned to the assignee of the instant application. U.S. Provisional Patent Application Ser. No. 60/019,089 is incorporated by reference herein in its entirety for all purposes.

BACKGROUND OF THE INVENTION

The present invention relates to computer networking systems and, more particularly, to systems and methods of providing Internet access to multiple users at a single location.

The Internet is a collection of thousands of computer networks around the globe. Internet usage has grown exponentially since 1993, mainly due to the world wide web (Web) and its electronic mail (e-mail) and web page capabilities. This interconnection of computers is possible because the Internet has adopted a communication standard (Transmission Control Protocol/Internet Protocol or TCP/IP) which allows computers with different operating systems to communicate with each other over a network of networks (an "internetwork").

By one estimation, over 8 million computers currently attach to the Internet. An estimated 40 million users worldwide access these computers ("hosts").

Corporations and private users increasingly demand easy, cost-effective, and high-speed (e.g., greater than **1** megabits per second or Mbps) access to public interoperable networks such as the Internet. Around the world, the demand for a technical infrastructure for building private networks on top of public networks also is increasing.

As the number of users on the Internet increases, so too do the users grow more sophisticated. Users are demanding greater bandwidth to support this sophistication.

In conventional systems a user might use several different suppliers and components to achieve connectivity and security. The user then has to change equipment and software protocols during his migration from a lower bandwidth (e.g., 56 kilobits per second or kbps) to a higher bandwidth (e.g., 1 Mbps or higher).

Accordingly, there is a need for a substantially simplified infrastructure to access public networks with a reduced number of components, a reduced number of software protocols, enhanced management capabilities for network components, and secure access to the public network.

SUMMARY OF THE INVENTION

The present invention provides systems and methods for providing multiple users with access to a public network like the Internet. A single high-bandwidth connection (e.g., fast Ethernet) allows the multiple users to communicate with the public network. Each user is allocated a specific bandwidth, and the user is able to freely communicate with the public network up to the allocated bandwidth. Additionally, the invention may be remotely configured to change bandwidth allocations.

In a preferred embodiment, the present invention provides an apparatus for communicating information packets between each of a plurality of ports (referred to as "user ports") and an additional port (referred to as the "network port"). The apparatus includes a switch for establishing communication paths between each of the user ports and the network port; storage for configuration information regarding the user ports; and a controller, responsive to the configuration information for a given user port, for limiting the flow of information packets between the given user port and the network port.

Additionally, the present invention provides a method for distributing data between a network port and multiple user ports. The method includes for each of the user ports, storing configuration information indicating the data bandwidth allocated to the port; receiving a request to send data between the network port and a selected user port; determining if the current data bandwidth of the selected user port exceeds the allocated data bandwidth; and sending the data between the network port and the selected user port if the current data bandwidth does not exceed the allocated data bandwidth.

Also, the present invention provides a method of establishing respective network connections between a wide area network (WAN) and each of multiple tenant sites at a single location to allow information packets to be communicated between each tenant site and the WAN. The method includes providing a central switching apparatus at the location, including a plurality of tenant ports and an additional network port; coupling the WAN to the network port; coupling at least one computer or a local area network (LAN) at each tenant site to a respective tenant port; and establishing, with the central switching apparatus, communication paths between each tenant port and the network port to provide each tenant with access to the WAN.

Further aspects and features of the present invention will become readily apparent to one of ordinary skill in the art on reading the background above and the description below.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. **1** shows several hardware components and connection mechanisms to access an internetwork;

FIG. **2** shows the present invention combining several OSI network layers;

FIG. **3** shows differences in connection mechanisms between the invention and a conventional system;

FIG. **4** illustrates a functional block diagram of an embodiment of the invention;

FIG. **5** illustrates a hardware block diagram of an embodiment of the invention;

FIG. **6** illustrates a software block diagram of an embodiment of the invention;

FIG. **7** is a flowchart of a software packet filtering process according to an embodiment of the invention; and

FIGS. **8**A and **8**B are flowcharts of a process for forwarding packets through the system according to an embodiment of the invention.

DETAILED DESCRIPTION OF SPECIFIC EMBODIMENTS

The following description uses the Internet as an example to describe in detail the current art of public network access. The invention, however, is not restricted to the Internet and is applicable to other commercially or publicly available networks.

Introduction

Internet access can be gained conventionally through two methods:

Dial-up service through an access provider such as AOL® or Compuserve® geared to the individual occasional user. However, the low capacity of such a dial-up

BUSINESS

PART I

SAFE HARBOR

All statements in this discussion that are not historical are forward-looking statements within the meaning of Section 21E of the Securities Exchange Act, including statements regarding Telocity's "expectations," "beliefs," "hopes," "intentions," "strategies," or the like. Such statements are based on management's current expectations and are subject to a number of factors and uncertainties that could cause actual results to differ materially from those described in the forward-looking statements. Telocity cautions investors that there can be no assurance that actual results or business conditions will not differ materially from those projected or suggested in such forward-looking statements as a result of various factors, including, but not limited to, the risk factors discussed in this Form 10-K.

Telocity expressly disclaims any obligation or undertaking to release publicly any updates or revisions to any forward-looking statements contained herein to reflect any change in our expectations with regard thereto or any change in events, conditions, or circumstances on which any such statements are based.

ITEM 1. BUSINESS OVERVIEW

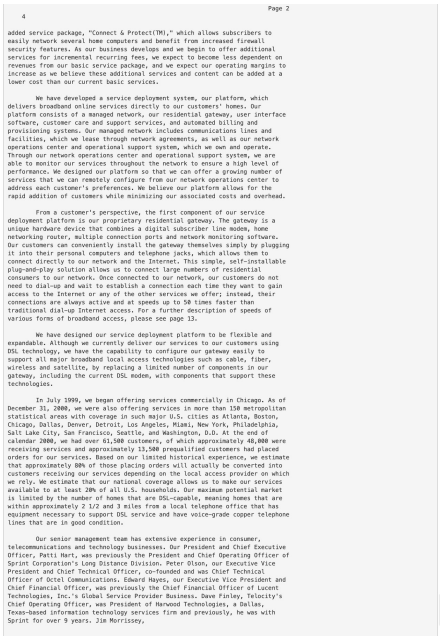
We develop, market and deliver to the residential market interactive online services and content designed for use over high-speed, or broadband, connections. These broadband connections allow our customers to enjoy services and content that they could not access with traditional slower speed Internet connections. Although we currently deliver our services to customers using digital subscriber line, or DSL, technology, in the future we intend to utilize the technology we have developed to deliver these services and content over a variety of broadband technologies from a managed nationwide network to and throughout the home. Our goal is to become a leading provider of broadband access services, content and home networking services to the residential market.

On December 21, 2000, we entered into an agreement with HUGHES Electronics Corporation (HUGHES), whereby HUGHES will acquire us for a total purchase price of approximately $178 million in cash. Under the terms of the merger agreement, a subsidiary of HUGHES has commenced a cash tender offer to purchase all of the outstanding shares of our common stock at a price per share of $2.15; if the tender offer is closed, the agreement provides for a follow-on merger with the HUGHES subsidiary with our remaining stockholders receiving $2.15 per share in cash. There can be no assurance that the tender offer will be consummated; the closing of the tender offer is subject to customary conditions. If the tender offer is not completed for any reason, we may be forced to discontinue operations, as we only have enough cash on hand to continue operations until April 15, 2001. See additional discussion regarding our proposed sale to HUGHES in Item 7 of this Form 10- K -- "Management Discussion and Analysis of Financial Condition and Results of Operations."

In order to ensure we have sufficient access to funding during the period prior to the consummation of our merger with HUGHES, HUGHES has agreed to provide unsecured interim financing of $20 million, pursuant to a convertible subordinated note; $20 million of this balance was drawn down by us during February and March, 2001.

We currently generate revenue by selling monthly subscriptions for our basic service package that may include activation and other one-time fees, and to date we have not received revenue from any of the content provided through our website. Revenues from these services for the year ended December 31, 2000 and 1999 were $9.4 million and $187,000, respectively. For a single monthly fee, a customer receives our current basic service package, which consists of always-connected Internet access, e-mail accounts, storage space and hosting for Web pages, and 60 minutes of remote access to the Internet each month when the customer is away from home. During November 2000, we began accepting orders for our first value-

Page 02
[HC0050][GDrive]



Page 2
4

added service package, "Connect & Protect(TM)," which allows subscribers to easily network several home computers and benefit from increased firewall security features. As our business develops and we begin to offer additional services for incremental recurring fees, we expect to become less dependent on revenues from our basic service package, and we expect our operating margins to increase as we believe these additional services and content can be added at a lower cost than our current basic services.

We have developed a service deployment system, our platform, which delivers broadband online services directly to our customers' homes. Our platform consists of a managed network, our residential gateway, user interface software, customer care and support services, and automated billing and provisioning systems. Our managed network includes communications lines and facilities, which we lease through network agreements, as well as our network operations center and operational support system, which we own and operate. Through our network operations center and operational support system, we are able to monitor our services throughout the network to ensure a high level of performance. We designed our platform so that we can offer a growing number of services that we can remotely configure from our network operations center to address each customer's preferences. We believe our platform allows for the rapid addition of customers while minimizing our associated costs and overhead.

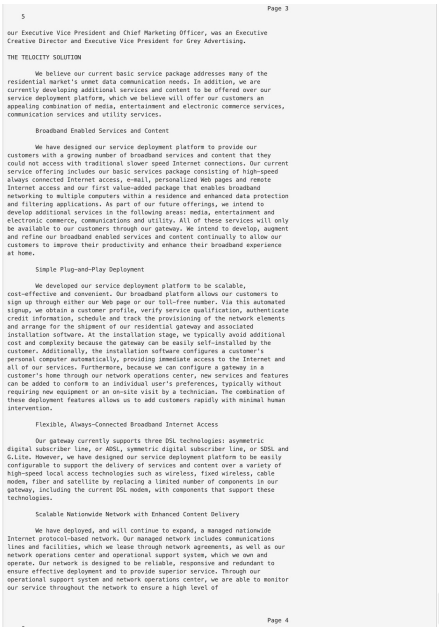
From a customer's perspective, the first component of our service deployment platform is our proprietary residential gateway. The gateway is a unique hardware device that combines a digital subscriber line modem, home networking router, multiple connection ports and network monitoring software. Our customers can conveniently install the gateway themselves simply by plugging it into their personal computers and telephone jacks, which allows them to connect directly to our network and the Internet. This simple, self-installable plug-and-play solution allows us to connect large numbers of residential consumers to our network. Once connected to our network, our customers do not need to dial-up and wait to establish a connection each time they want to gain access to the Internet or any of the other services we offer; instead, their connections are always active and at speeds up to 50 times faster than traditional dial-up Internet access. For a further description of speeds of various forms of broadband access, please see page 13.

We have designed our service deployment platform to be flexible and expandable. Although we currently deliver our services to our customers using DSL technology, we have the capability to configure our gateway easily to support all major broadband local access technologies such as cable, fiber, wireless and satellite, by replacing a limited number of components in our gateway, including the current DSL modem, with components that support these technologies.

In July 1999, we began offering services commercially in Chicago. As of December 31, 2000, we were also offering services in more than 150 metropolitan statistical areas with coverage in such major U.S. cities as Atlanta, Boston, Chicago, Dallas, Denver, Detroit, Los Angeles, Miami, New York, Philadelphia, Salt Lake City, San Francisco, Seattle, and Washington, D.D. At the end of calendar 2000, we had over 61,500 customers, of which approximately 48,000 were receiving services and approximately 13,500 prequalified customers had placed orders for our services. Based on our limited historical experience, we estimate that approximately 80% of those placing orders will actually be converted into customers receiving our services depending on the local access provider on which we rely. We estimate that our national coverage allows us to make our services available to at least 20% of all U.S. households. Our maximum potential market is limited by the number of homes that are DSL-capable, meaning homes that are within approximately 2 1/2 and 3 miles from a local telephone office that has equipment necessary to support DSL service and have voice-grade copper telephone lines that are in good condition.

Our senior management team has extensive experience in consumer, telecommunications and technology businesses. Our President and Chief Executive Officer, Patti Hart, was previously the President and Chief Operating Officer of Sprint Corporation's Long Distance Division. Peter Olson, our Executive Vice President and Chief Technical Officer, co-founded and was Chief Technical Officer of Octel Communications. Edward Hayes, our Executive Vice President and Chief Financial Officer, was previously the Chief Financial Officer of Lucent Technologies, Inc.'s Global Service Provider Business. Dave Finley, Telocity's Chief Operating Officer, was President of Harwood Technologies, a Dallas, Texas-based information technology services firm and previously, he was with Sprint for over 9 years. Jim Morrissey,

Page 03
[HC0051][GDrive]



Page 3
5

our Executive Vice President and Chief Marketing Officer, was an Executive Creative Director and Executive Vice President for Grey Advertising.

THE TELOCITY SOLUTION

We believe our current basic service package addresses many of the residential market's unmet data communication needs. In addition, we are currently developing additional services and content to be offered over our service deployment platform, which we believe will offer our customers an appealing combination of media, entertainment and electronic commerce services, communication services and utility services.

Broadband Enabled Services and Content

We have designed our service deployment platform to provide our customers with a growing number of broadband services and content that they could not access with traditional slower speed Internet connections. Our current service offering includes our basic services package consisting of high-speed always connected Internet access, e-mail, personalized Web pages and remote Internet access and our first value-added package that enables broadband networking to multiple computers within a residence and enhanced data protection and filtering applications. As part of our future offerings, we intend to develop additional services in the following areas: media, entertainment and electronic commerce, communications and utility. All of these services will only be available to our customers through our gateway. We intend to develop, augment and refine our broadband enabled services and content continually to allow our customers to improve their productivity and enhance their broadband experience at home.

Simple Plug-and-Play Deployment

We developed our service deployment platform to be scalable, cost-effective and convenient. Our broadband platform allows our customers to sign up through either our Web page or our toll-free number. Via this automated signup, we obtain a customer profile, verify service qualification, authenticate credit information, schedule and track the provisioning of the network elements and arrange for the shipment of our residential gateway and associated installation software. At the installation stage, we typically avoid additional cost and complexity because the gateway can be easily self-installed by the customer. Additionally, the installation software configures a customer's personal computer automatically, providing immediate access to the Internet and all of our services. Furthermore, because we can configure a gateway in a customer's home through our network operations center, new services and features can be added to conform to an individual user's preferences, typically without requiring new equipment or an on-site visit by a technician. The combination of these deployment features allows us to add customers rapidly with minimal human intervention.

Flexible, Always-Connected Broadband Internet Access

Our gateway currently supports three DSL technologies: asymmetric digital subscriber line, or ADSL, symmetric digital subscriber line, or SDSL and G.Lite. However, we have designed our service deployment platform to be easily configurable to support the delivery of services and content over a variety of high-speed local access technologies such as wireless, fixed wireless, cable modem, fiber and satellite by replacing a limited number of components in our gateway, including the current DSL modem, with components that support these technologies.

Scalable Nationwide Network with Enhanced Content Delivery

We have deployed, and will continue to expand, a managed nationwide Internet protocol-based network. Our managed network includes communications lines and facilities, which we lease through network agreements, as well as our network operations center and operational support system, which we own and operate. Our network is designed to be reliable, responsive and redundant to ensure effective deployment and to provide superior service. Through our operational support system and network operations center, we are able to monitor our service throughout the network to ensure a high level of

Page 4

Page 04
[HC0052][GDrive]

Page 4
6

support. We intend to implement a differentiated-services protocol throughout this network which will allow either us or our customers to prioritize the use of available bandwidth among the services we provide. For example, a customer will be able to prioritize the viewing of video streams over the downloading of less time-sensitive data. Additionally, we reduce redundant data traffic on the network and speed data delivery to our customers, by duplicating and storing frequently accessed content locally at network hubs via satellite communications. This system distributes content rapidly and cost-effectively throughout our nationwide network.

Service Flexibility and Ease-of-Use

We designed our service deployment platform to be adaptable and responsive to the needs of our customers. For example, the deployment, configuration and management of each customer feature and application is fully automated, allowing for ease of installation and use. This ease-of-use, along with our remote configuration capabilities, enhances our ability to provide flexible service and high quality customer care. Additionally, because the residential gateway remains connected to our network at all times, we can directly monitor and address service needs in a timely fashion. Finally, we have implemented comprehensive customer care and support systems to address customers' needs that cannot be resolved remotely.

BUSINESS STRATEGY

Our goal is to exploit our advantage as both one of the first companies to provide residential broadband services and in our proprietary technology in order to become a provider of choice for broadband enabled services and content both to and throughout the home. Our ability to achieve these goals and execute upon the strategies described below is dependent upon our ability to either close the tender offer and merger with the HUGHES subsidiary or immediately obtain a substantial amount of additional financing. If we are able to close the tender offer and merger or obtain that financing, we intend to implement the following strategies to achieve our goal:

Capture Our Early Market Entrant and Proprietary Technology Advantage

Currently, most consumers who have Internet connections experience slow dial-up access, non-customized narrowband content and limited customer service. The deployment of broadband access technology and content addresses those limitations. However, most broadband providers must invest significant time and capital to extend or upgrade their network in order to provide this access technology and content to consumers. We believe that we have a significant time-to-market advantage over those broadband providers because our service deployment platform is designed to be easily configurable to support any currently available broadband access technology. We designed our proprietary gateway device to be self-installable, interoperable with multiple technologies and easily upgradeable. In addition, because our customers can easily install our residential gateway and because our service deployment platform is flexible, we can add new customers rapidly on a nationwide basis.

Deliver Quality Broadband Services Both to and throughout the Home

We have designed our service deployment platform to deliver high-speed, always-connected Internet access along with associated broadband services and content such as online gaming, streaming audio and video, interactive shopping, chat facilities and enhanced voice messaging services. In addition, we intend to extend our services and content to devices throughout the home. For example, we designed the next-generation residential gateway to provide home networking capabilities by allowing a customer's personal computer and other home appliances to connect with the gateway through wireless technology or through the existing home phone wiring. This functionality allows us to provide our customers with additional services, including home monitoring and data security features, and allows our customers to access services from multiple computers within the home.

Page 5

Page 05
[HC0053][GDrive]

Deliver High-Quality Customer Service and Support

We have established a network operations center and a customer support system in order to provide our customers with high quality service, support and care. From our network operations center, we are able to install or upgrade remotely a customer's desired service and to address any performance inquiries. Our customer support system provides technical support through an automated interactive voice response system, a live telephone support line, direct chat system, online instructions for our product features and e-mail. These systems enable 24-hour-a-day, 7-day-a-week proactive monitoring and management of our entire network as well as customer service and technical support. All of these systems have been designed with significant flexibility and scalability. We believe that by providing high quality customer service and support, we will enhance the overall customer experience and foster customer loyalty.

SERVICES

Our service deployment platform is capable of delivering a comprehensive suite of broadband services, including high-speed Internet connections and additional related services to residential customers through a variety of local access technologies.

We seek to price our services competitively in each of our markets. We typically enter into a customer service agreement and charge a monthly fee for our basic service package with no additional per-minute charges. The customer service agreement also provides information on commencement of the service, billing, payments, pricing, system requirements and service termination. As our business has developed, and we have begun to offer additional services for incremental recurring fees, we expect to become less dependent on revenues from our basic service package and we expect our operating margins to increase as we believe these additional services and content can be added at a lower cost than our current basic services.

Our service currently provides data transfer speeds ranging from 144 kilobits per second to 1.5 megabits per second; however, we are capable of providing service at data transfer speeds up to 7.5 megabits per second. The speeds we offer in any given market are based upon the speed of connectivity we purchase from our local access provider. Additionally, our platform allows our ADSL customers to use a single phone line for multiple purposes at once, so that a customer may have a voice conversation, browse the Internet and download information simultaneously, thereby eliminating the need for a second phone line.

A customer who subscribes to our service receives our residential gateway device that, in addition to providing high-speed Internet access, allows us to provide our basic service package, which consists of:

- Always Connected Broadband Access. This feature eliminates many disadvantages of dial-up connections, including busy signals and the slow dial-up process. Always connected broadband access to the home significantly enhance various customer-configured information services, such as instant messaging, e-mail and content related services featuring information such as stock quotes, real time news, sports and weather.
- Unlimited Access. We provide our customers unlimited access to the Internet and our services with no per-minute usage charges.
- E-Mail Accounts. We provide our customers three e-mail accounts as part of our service. If our customers require additional e-mail accounts, we can provide them for a minimal additional charge.
- Personalized Web Pages. Our service provides up to 10 megabytes of storage space for each customer to store e-mails or design and host individual Web pages.

Page 06
[HC0054][GDrive]

- Remote Access. Our service allows our customers to access the Internet, their e-mail accounts and other services remotely by using a toll-free dial-up connection. We provide this service to our customers at no additional charge for the first 60 minutes of use each month and charge an incremental fee for each additional minute. This remote access feature ensures that our customers will be able to connect to the Internet away from home.
- The flexible architecture of our platform enables us to add new functions and features. Some of these new functions and features will be offered through upgrades or the addition of new technology to our networks. During the fourth quarter of 2000, we began marketing our first value-added service package, Connect & Protect(TM). This value-added service allows subscribers to network up to five PCs thereby enabling different members of the same family to browse the internet simultaneously at different personal computers in their home. We also have embedded data access intrusion detection and prevention technology that enables us to configure and monitor a customer's firewall through our operational support system. This process can be accomplished without any intervention required on the part of a customer. As a result, a customer without technical expertise is able to request protection through our advanced security and firewall services.

THE TELOCITY/NBCI PORTAL

Through our agreements with NBC Internet, Inc.(NBCi), we provide dynamic multimedia broadband content for our customers. Customers are able to access this content through the Website we have developed with NBCi, the Telocity/NBCi portal. The Telocity/NBCi portal, located at http://telocity.snap.com, is the first Web page a customer views when accessing our services. From this page, a customer can access the Internet as well as some of the services provided by us and NBCi. The Web portal currently offers media, entertainment and electronic commerce services provided exclusively by NBCi, such as interactive shopping, a limited selection of streaming audio and video, financial information, sports, news and weather. Through the Telocity/NBCi portal, our customers have been able to access the full suite of NBCi's entertainment offerings, which included live streaming video of the 2000 Olympics in Sydney, Australia.

On December 21, 2000, we entered into an Amendment Agreement (the "Amendment") with NBCi pursuant to which it was mutually agreed to terminate the NBCi/Telocity Operating Agreement dated December 10, 1999 and concurrently amended our Advertising Agreement dated December 14, 1999 with NBCi (the "Advertising Agreement"). The Amendment provided, among other things, that upon the consummation of our merger with HUGHES, the Operating Agreement will terminate, provided that, however, certain provisions of the Operating Agreement will survive. The Advertising Agreement was amended to include an additional $3.6 million in online, television, and radio advertising through December 31, 2002. The Amendment also requires that we conduct good faith discussions with NBCi regarding the possibility of an ongoing commercial relationship.

OUR BROADBAND SERVICE DEPLOYMENT PLATFORM

We designed our broadband service deployment platform to provide reliable, high-performance Internet access and to alleviate Internet bottlenecks through an easily deployed scalable architecture with end-to-end network management capabilities. Through our platform, we will continue to offer a growing number of services and content offering that we can remotely configure to each customer's needs. Our broadband service deployment platform consists of the proprietary residential gateway device, our managed network, our user interface software, our customer care and support services, and our automated billing and provisioning systems.

Our Residential Gateway

We believe that customers find our broadband service easy to use primarily because of the proprietary device we refer to as our residential gateway. The gateway combines a DSL modem, a home networking router, multiple connection ports, and network monitoring software in a device that simplifies

Page 07
[HC0055][GDrive]

installation, customer support, and service upgrades. The residential gateway is a standalone unit that operates independently of the computer's operating system and does not require a network interface card to be installed in the computer.

Our Managed Network

Our managed network includes communications lines and facilities, which we lease through network agreements, as well as our network operations center and operational support system, which we own and operate. We have based our network architecture on the operational goals of responsiveness, reliability and redundancy. Our network begins with the connection of a customer's personal computer, or home network of computers, to our residential gateway. In our current markets, the connection to the customer is routed to DSL equipment owned either by the local telephone company or by a competitive local exchange carrier and located in the local central office which we lease through network agreements. In the future, we expect our local access connectivity to utilize a variety of local access technologies in addition to DSL, including satellite, wireless and cable solutions. We aggregate our customer traffic through dedicated circuits into our leased local metropolitan hubs currently located in: Atlanta, Miami, Orlando, Los Angeles, Dallas, McLean (Virginia), New York City, Chicago, Denver, Philadelphia, Boston and Cupertino. These dedicated circuits are located in secure data-centers where we lease facilities. Between metropolitan hubs, our customer traffic travels on a leased high-capacity fiber network which is interconnected to the Internet and to other network providers at Internet exchange points via private and public peering arrangements. Network peering is the process of connecting to other networks at the closest point, thereby ensuring the least number of connection points in the delivery of data.

Our managed network has been designed to be secure and reliable. We provide network monitoring and management 24-hours-a-day, 7-days-a-week from our network operations center in Cupertino, California. We have engineered our network to minimize the likelihood of service interruptions via our redundant leased optical carrier 3 network. This secure, high-capacity fiber link has the capacity to transmit 145 megabits of data per second in two directions throughout the network. We have upgraded and will continue to upgrade the transmission capacity of this backbone as dictated by our customers' requirements to ensure that we continue to provide best-in-class service. If a failure occurs in either of these fiber links, the other link will transmit the data with no service loss to our customers. In addition, we have configured our network to have two domain name system servers and two e-mail servers in each metropolitan hub. If any of these servers are down, our network will automatically deliver data to the closest server that is functioning. Furthermore, we place the Internet protocol addresses for domain name system servers and e-mail servers on switches that redirect traffic to the nearest available server.

In order to improve network performance and minimize both delays and bandwidth availability problems, we move data closer to our customers. We have implemented this strategy by developing a network architecture that uses Inktomi technology and CacheFlow caching servers customized for use with our network. These caching servers are connected not only via the Internet but also via our satellite content feeds. Additionally, our network directs each customer's data request to the closest available server containing the requested content, service or application. This close proximity enhances the delivery of data to our customers.

We sometimes use satellite content feeds to supply data to our caching servers because transmission of data by satellite is often more cost effective and efficient than transmission of data over our leased land-based network. We lease satellite dishes located on the roofs of buildings that are connected to our leased land-based network, from which we receive content from a satellite owned by Cidera, Inc., a satellite caching company. Cidera transmits web-based content that our customers frequently access to this satellite throughout the day. Once transmitted to the satellite, this content is periodically retransmitted to our satellite dishes to help prevent data traffic congestion on our leased land-based network.

Our network design anticipates that not all data is equally important to a customer or requires the same urgency for delivery. In most cases, data is transmitted across the Internet on a first in, first out basis. However, to prioritize time-sensitive or other high priority data traffic our managed network will implement a differentiated services protocol from the customer's gateway across our nationwide network.

Page 08
[HC0056][GDrive]

This differentiated services protocol will allow either us or our customers to prioritize the use of available bandwidth among the services we provide. For example, our managed network will identify less time-sensitive traffic, such as file transfer protocol, and then prioritize this data delivery based upon a customer's, or content provider's, preference.

Our Customer Care and Support Services

A high level of continuing service and support is critical to our objective of developing long-term customer relationships. We emphasize customer service and technical support to provide our customers with the knowledge and resources to utilize our online services and content successfully.

We offer customer support 24-hours-a-day, 7-days-a-week. We believe it is critical to our success to have available the resources necessary to support our customers through the entire enrollment and fulfillment process, a vital formative period in each customer's relationship with us. We focus on pre-sales, loop qualification, technical assistance, phone company provisioning, gateway shipment and billing to address our customers' needs. Our objective in serving our customers is to have enough customer service consultants to ensure that our customers are not placed on hold when they need assistance.

We employ Sutherland, a technical customer support organization, to respond to and assist our customers with technical issues. Sutherland's call center processes, technical expertise and scalability help us to provide our customers with real-time assistance.

In addition to supporting our customers, Sutherland also assists us in actively monitoring and reviewing customer calls. We combine this feedback with comments we receive directly, including through our Website, to address and prevent the recurrence of problems experienced by our customers. We have our own in-house customer care staff that helps to service the more complex needs of our customers. We also have a customer recovery unit to address critical complaints that cannot be solved by Sutherland. We believe these initiatives will help reduce customer turnover and help increase customer satisfaction. We actively monitor comments by customers and respond by incorporating their suggestions into our customer care policies.

Our Automated Billing and Provisioning Systems

We have built our service deployment platform to perform metering and billing tasks in the gateway. This functionality allows us to automate, monitor and conveniently bill for each customer's services and products with minimal human intervention. This functionality and minimal human intervention also provides us with scalability for a number of services. We intend to expand the metering and billing functionality.

We developed our billing and provisioning system as a customer focused, Web-enabled process that ties together all of our customer-related processes, including sales, customer service, marketing, billing, accounting, loop qualification and order fulfillment. Using our automated back office process, customers can subscribe to a service without the intervention of a service representative. Once an order has been placed, the customer information is disseminated in real-time to all of our key information technology systems. This reduces costs and helps eliminate service errors. In addition, this real-time information system provides us with a significant competitive advantage because it helps us offer new services quickly and respond to changes in our market.

SALES AND MARKETING

Our key sales and marketing objective is to be a leading provider of broadband services and content to residential customers.

We are leveraging our platform to capitalize on multiple methods to attract customers. We continue to undertake targeted direct marketing efforts, and in September 2000 we launched a nationwide television and radio campaign, financed by the utilization of advertising credits received from NBC and

Page 09
[HC0057][GDrive]

NBCi in exchange for Series C Mandatorily Redeemable Preferred Stock, coincident with our nationwide network deployment. We established and are now expanding our channel programs, wherein companies market and sell our services. We also continue to enter into agreements with channel partners to establish affinity marketing programs, through which companies market and sell our services through their own sales or distribution channels to their own existing or prospective customers with special promotional or bundled offers. In addition, we have entered into agreements with other channel partners to establish employee and telecommuter programs, through which companies may provide our services to their workers who have a business need for high-speed Internet access at home.

Our targeted direct marketing and branding effort uses a mix of print, direct mail, radio, television and online advertising media specifically tailored for each local market. We do not employ a sales force in this marketing effort.

SUPPLIERS AND VENDORS

Our engineers are responsible for prototype development of our residential gateway. However, we outsource the manufacturing of the gateway. Our manufacturing partner provides materials planning and procurement, final assembly, testing and quality control under our supervision. Our manufacturing process enables us to configure our products to meet a wide variety of customer requirements and respond to future technological and industry developments. We currently employ Wellex Corporation as the sole contract manufacturer of our gateway.

COMPETITION

The business of broadband and Internet services is highly competitive with frequent new market entrants, many of whom may be rivals. The principal bases of competition in our markets include:

- price;
- performance, including breadth of service availability, reliability of service;
- ease of access and use;
- network security;
- availability and desirability of content;
- customer support;
- brand recognition and market penetration; and
- capital resources.

We anticipate that over the next few years the high-speed broadband market will become increasingly commoditized, thereby standardizing the price of broadband access. We believe that those providers who will differentiate themselves will do so on the basis of value-added services.

We believe America Online/TimeWarner, At Home Corporation, Earthlink, and AT&T Broadband represent our most direct source of competition and that we will face direct and indirect competition from:

- providers of online services;
- Internet service providers;
- cable modem service providers;

Page 10
[HC0058][GDrive]

- interactive television providers;
- Internet portal or content sites;
- telecommunications service providers;
- wireless and satellite service providers; and
- consumer electronics and appliance manufacturers.

Although many companies offer broadband access and content, we believe that we are currently the only company that combines all of the following features into a unified service offering tailored for the residential market:

- we manage data traffic over the network, lease and utilize telecommunications lines and facilities and operate our own network operations center;
- we have designed and supply our own proprietary gateway device, which we have customized to provide our current services and which will enable us to provide our future services;
- we provide content and services to our subscribers, many of which we have customized for high-speed Internet access; and
- our service delivery system, or platform, allows us to provision customers quickly and cost-effectively, as does our simple plug-and-play residential gateway device.

The unique combination of all of these features provides us with flexibility and scalability. The most significant feature unique to our service offering is our plug-and-play residential gateway device. Our proprietary gateway combines a DSL modem, a home networking router, multiple connection ports and network monitoring software. Because our gateway simplifies installation, customer support and service upgrades, we can deploy our services to customers nationwide more rapidly at a lower cost than competitors who do not have a similar device. For a more complete discussion of our gateway, please refer to "-- Our Broadband Service Deployment Platform -- Our Residential Gateway." And, unlike some of our competitors, we are not dependent upon a single local access technology to deliver our services, but have designed our platform to be configured to support technologies other than DSL.

Online Service Providers

Online service providers include companies such as AOL, At Home Corporation, and MSN. These companies provide services and content over the Internet and on proprietary online services ranging from news and sports to video conferencing. In addition, these companies provide Internet connectivity, ease-of-use and consistency of environment, especially through the development of their own access networks. After its merger with Time Warner, AOL will have access to content for its broadband access customers similar to the services we will provide.

Internet Service Providers

Internet service providers include both national and regional providers, independent Internet service providers and Internet service providers affiliated with a telecommunications carrier or a data-centric competitive carrier. Internet service providers such as Earthlink Networks provides Internet access to residential customers, generally using the existing telephone network. Many Internet service providers have begun offering DSL-based services.

hese competitors have traditionally distinguished themselves from the online service companies because they provide only Internet access rather than a collection of proprietary content and services. This

Page 11
[HC0059][GDrive]

distinction has diminished because major online services companies also offer access while many portal sites actively compete for the chance to provide proprietary content services to the subscribers of major Internet service providers. Of the thousands of Internet service providers in the United States, the majority are relatively small, localized providers.

Cable Modem Service Providers

Providers such as At Home Corporation, AOL/Time Warner, AT&T Broadband, High Speed Access, SoftNet and RoadRunner and their respective cable partners are deploying high-speed Internet access services over hybrid fiber coaxial cable networks. Where deployed, these networks provide similar speed, and when handling a limited amount of traffic, provide higher-speed Internet access than we provide through DSL. A number of cable modem service providers have existing local and regional monopolies in their service markets. In addition, cable modem service providers and their partners have more direct ties to desirable traditional media and entertainment content, as well as the size and financial resources to execute exclusive deals for content.

Interactive Television Providers

Several companies are developing technologies relevant to interactive television. For example, Wink and Liberate are software developers that are working to create interactive television solutions. Microsoft has been active in many areas of interactive television. Microsoft's wholly-owned subsidiary, WebTV, offers set-top boxes with Internet access, interactive program listings, and simultaneous television and Internet usage. EchoStar offers WebTV to its subscribers. Microsoft has also acquired equity interests in several network operators. These investments give Microsoft influence in the network operator's choice of interactive software. With its financial, technical and marketing resources, Microsoft will be a strong competitor in the market for interactive television operating systems.

Internet Portal Sites

Internet portal sites such as Yahoo! and Lycos are specialized Websites that offer an aggregation of content and services either directly or through hyperlinks to other sites. Internet portal sites typically offer search engines, navigational aids, directories, chat facilities, classified ads, message boards, e-mail and other customized content and services. Many sites derive a majority of their revenues from the display of advertising on the site, but may also generate revenue from product promotions or redirection of Internet traffic from the portal to specific sites.

Wireline Telecommunications Service Providers

Telecommunications service providers, including new competitive telecommunications companies, traditional telephone companies, and traditional and new long-distance carriers all pose competition to us because many currently offer DSL services.

- Traditional Telephone Companies. All of the largest traditional telephone companies in our target markets have begun offering DSL services or have announced their intention to provide DSL services in the near term. The traditional telephone companies have an established brand name in their service areas, possess sufficient capital to deploy DSL equipment rapidly, own the local lines themselves and can bundle digital data services with their existing voice services to achieve economies of scale in serving their customers. Certain of the traditional telephone companies have aggressively priced their consumer DSL services as low as $30-$40 per month, placing pricing pressure on our service.

- New Competitive Telecommunications Companies. Many competitive carriers such as Covad, Rhythms NetConnections and NorthPoint Communications offer high-speed DSL-based services. Companies such as RCN, MicroDUSA, and some subsidiaries of utility companies currently offer or are beginning to offer voice and data service to the residential market.

Page 12
[HC005A][GDrive]

- National Long Distance Carriers. Interexchange carriers, such as AT&T, Sprint, MCI WorldCom, GTE, and Qwest sell connectivity to businesses and residential customers, and they have brand recognition. They also have interconnection agreements with many of the traditional telephone companies and a number of spaces in central offices from which they are currently offering or could begin to offer competitive DSL services.

Wireless and Satellite Telecommunications Service Providers

Wireless and satellite telecommunications service providers utilize wireless and satellite-based networks to provide Internet connectivity. We may face increasing competition from terrestrial wireless services, including 2 Gigahertz (Ghz) and 28 Ghz wireless cable systems (multi-channel multipoint distribution system and local multipoint distribution system), and 24 Ghz and 38 Ghz point-to-point microwave systems. For example, the FCC has adopted new rules to permit multi-channel multipoint distribution system licensees to use their systems to offer two-way services, including high-speed data, rather than solely to provide one-way video services. The FCC also recently auctioned spectrum for local multipoint distribution system services in all markets. This spectrum is expected to be used for wireless cable and telephony services, including high-speed digital services. The FCC has announced that it plans to auction off additional spectrum from time to time for other wireless services. In addition, companies such as Teligent Inc., Advanced Radio Telecom Corp. and WinStar Communications, Inc., which are targeted to the business market, hold point-to-point microwave licenses to provide fixed wireless services such as voice, data and videoconferencing. We also may face increasing competition from satellite-based systems. Motorola Satellite Systems, Inc., Teledesic and others have filed applications with the FCC for global satellite networks which can be used to provide broadband voice and data services, and the FCC has authorized several of these applicants to operate their proposed networks.

Consumer Electronics and Appliance Manufacturers

Our service deployment platform will support a number of consumer electronic devices and appliances, including cellular phones, flat panel displays and personal digital assistants. Consumer electronics companies and manufacturers of appliances may, in the future, decide to compete with us by bundling their own software with their hardware products, or by entering into exclusive alliances with a competitor. In both instances, they might create products that are incompatible with our systems.

COMPARISON OF DIAL-UP AND BROADBAND TECHNOLOGIES

For our local access connections, the speed and effectiveness of the DSL connection we utilize varies based on a number of factors. In the future, we intend to examine utilizing a variety of high-speed local access technologies as they gain popularity. The chart below together with the footnotes compares the performance and range for traditional dial-up service with those of broadband technologies.

<TABLE>

	Dial-up	ADSL	SDSL	IDSL	Cable	Satellite
Speed to End Users	28-56Kbps	144Kpbs-8Mpbs(2)	128Kbps-2Mbps(3)	144Kbps(4)	4Mbps-10Mpbs	384Kbps-400Kbsp(6)
Speed from End Users	14-33Kbps	64Kbps-1Mbps	64Kbps-1.5Mbps	144Kbps	1Mbps-4Mbps(5)	14Kbps-33Kbps(7)
Distance Limitations	None(1)	17,500 ft	29,000 ft	30,000 ft	None	None

</TABLE>

Key: Kbps = kilobits per second
Mbps = megabits per second (1000 Kbps = 1 Mbps)

(1) Speed is limited by line condition.

(2) The following table sets forth estimated distance limitations and speeds for ADSL:

Page 13
[HC005B][GDrive]

<TABLE>

NUMBER OF FEET	SPEED TO END USER	SPEED FROM END USER
15,000	384 Kbps	384 Kbps
14,000	512 Kbps	512 Kbps
12,000	768 Kbps	768 Kbps
12,000	1 Mbps	1 Mbps
10,700	3 Mbps	1 Mbps
9,000	5 Mbps	1 Mbps
7,000	7.1 Mbps	1 Mbps

</TABLE>

These numbers vary by the telecommunications service provider of the ADSL connection. ADSL speed is also affected by the distance of the end user from the local telephone office and the condition of the copper telephone line that connects the end user to the local telephone office.

(3) The following table sets forth estimated distance limitations and speeds for SDSL:

<TABLE>

NUMBER OF FEET	SPEED TO END USER	SPEED FROM END USER
18,000	256 Kbps	256 Kbps
8,000	1.5 Mbps	1.5 Mbps

</TABLE>

These numbers vary by the telecommunications service provider of the SDSL connection. SDSL technology allows end users to achieve up to 1.5 Mbps speeds both to and from the end user. Depending on the quality of the copper telephone line, 1.5 Mbps can typically be achieved if the end user is within 8,000 feet, or approximately 1.5 miles, from the local telephone office.

(4) The following table sets forth the estimated distance limitation and speed for IDSL:

<TABLE>

NUMBER OF FEET	SPEED TO END USER	SPEED FROM END USER
Unlimited	144 Kbps	144 Kbps

</TABLE>

These numbers vary by the telecommunications service provider of the IDSL connection. IDSL technology may reach all end users within a telephone office serving area irrespective of the end user's distance from the telephone office. IDSL service operates at up to 144 Kbps in each direction and can use existing integrated services digital network equipment at the end user site. IDSL may be offered to end users that have lines that do not consist of continuous copper, such as digital line carrier equipped lines that are partially copper and partially fiber. Speeds are 128 Kbps under certain circumstances.

(5) Bandwidth is generally shared between individuals in a particular neighborhood so that service may be degraded if a number of users attempt to utilize the service over shared bandwidth at the same time. The connection from the end user may be analog for some cable system providers limiting speed from the end user to 33Kbps.

(6) Requires a line of sight view to receive the satellite signal.

Page 14
[HC005C][GDrive]

(7) Speeds from the end user are limited by a analog connection to 33Kbps.

NATIONWIDE NETWORK ROLLOUT

At the end of 2000, we offered services in more than 150 of the nation's 349 metropolitan statistical areas. We identified markets in which to offer our services based upon a number of criteria, including the following:

- The total number of potential customers and the anticipated consumer response to our service offering in a market;

- the technical compatibility of our equipment with the equipment of traditional telephone companies and competitive telephone companies in a market;

- our ability to negotiate agreements with and receive cooperation from traditional telephone companies and competitive telephone companies in specific regions of the nation as well as within a single market for network connections and other infrastructure needs;

- the number of households of potential customers that are DSL-capable in a market;

- the existence of competitors as well as the services and prices offered by those competitors in a market; and

- our anticipated return on investment from expanding our network to a market.

Once we have determined that we would like to begin offering our services in a market, we put in place the components of our managed network necessary to deliver our services. In particular, we lease additional communication lines to ensure that we have sufficient capacity on our managed network and we purchase number of dedicated circuits to meet the projected demand for our services in a market. We also lease communications facilities, and, as necessary, facilities space for new metropolitan hubs, which are data distribution centers in metropolitan areas. Once we have configured and tested our network and equipment, we are ready to begin provisioning services to new customers in the market.

NETWORK AGREEMENTS

The gateway used by our customers is connected to a telephone line and from there to DSL equipment. This equipment is owned by the traditional telephone company or the new competitive carrier and is located in the local central office. We currently have agreements for DSL connectivity with Rhythms Links Inc., a subsidiary of Rhythms NetConnections, Inc., NorthPoint, Inc., BellSouth, Bell Atlantic Network Services, Southwestern Bell, Pacific Bell, and Nevada Bell.

In September and October 1999, we entered into a number of non-exclusive agreements with BellSouth. We entered into a market development agreement with BellSouth Business Systems, Inc. in which we agreed to market asymmetrical digital subscriber line service in areas in which BellSouth has asymmetrical digital subscriber line service available. We also entered into a series of agreements with BellSouth Telecommunications, Inc. in which we agreed to purchase asymmetrical digital subscriber line and related telecommunications services from BellSouth pursuant to its FCC tariffs. The commitments and terms of our agreements for telecommunications services are for 36 months.

In September 1999, we entered into a five-year agreement with Bell Atlantic Network Services, Inc. to purchase asymmetrical digital subscriber line services pursuant to Bell Atlantic's FCC tariffs. In October 1999, we entered into a 54-month agreement to purchase asymmetrical digital subscriber line services from Southwestern Bell, Pacific Bell and Nevada Bell pursuant to applicable FCC tariffs.

In March 2000, we entered into an amended one-year provisioning agreement with Rhythms Links Inc. for DSL lines and connections between our points of presence and Rhythms Links Inc. This

Page 15
[HC005D][GDrive]

agreement is non-exclusive and gives us the right to purchase services or products from other providers. The agreement provides that we may purchase up to 10,000 lines at costs fixed in the agreement.

In April 2000, we entered into a two-year provisioning agreement with NorthPoint Communications Inc. for DSL lines and connections between our points of presence and NorthPoint Communications Inc. This agreement is non-exclusive and gives us the right to purchase services or products from other providers. The agreement provides that we may purchase up to 20,000 lines at costs fixed in the agreement.

In each of the metropolitan hubs of our networks, we aggregate our customer traffic through dedicated circuits. We have agreements for dedicated circuits, collocation, backbone and peering agreements with Level 3 Communications, LLC and MCI WorldCom. In October 1999, we entered into agreements with Level 3 terminating in September 2002 that provide us with optical carrier 3, digital signal, level 1, digital signal, level 3 and other circuits, collocation throughout the country at Level 3's facilities, roof rights for the location of our caching satellite dishes, remote hands services and peering arrangements. Through Level 3, we currently have collocation space in Atlanta, Miami, Orlando, Los Angeles, Dallas, McLean (Virginia), New York City, Chicago, Denver, Philadelphia, Boston and Cupertino. In October 1999, we entered into agreements with MCI WorldCom terminating in September 2002 that provide us with optical carrier 3, digital signal, level 1, digital signal, level 3 and other circuits as well as collocation space and peering arrangements. In 2000, we added collocation space through both Level 3 and MCI WorldCom.

GOVERNMENT REGULATION

Many of the services and content that we offer are subject to varying degrees of federal, state and local regulation. Future regulations and legislation may be less favorable to us than current regulation and legislation.

In addition, we may expend significant financial and managerial resources to participate in proceedings setting rules at either the federal or state level, without achieving a favorable result.

Communications Regulation

The Telecommunications Act of 1996 substantially departs from prior legislation in the telecommunications industry by establishing local telecommunications competition as a national policy. The Telecommunications Act removes state regulatory barriers to competition and overrules state and local laws restricting competition for telecommunications services, in part, by accelerating competitive entry into the telecommunications market, including new DSL services offered by competitive carriers. The Telecommunications Act establishes a market structure in which the network infrastructure and services we purchase are now available from a variety of providers in addition to traditional telephone companies. As a result, our business options and choice of vendors, along with the quality and price of facilities and services we buy from telecommunications carriers, should become more favorable over time. Nevertheless, our business is substantially dependent on successful implementation of the Telecommunications Act by the FCC and other regulatory agencies and it impact on competition among our vendors.

Recently, the viability of several Competitive Local Exchange Carriers (CLECs) has been brought into question because, among other things, of the significant capital requirements for their businesses and market conditions that suggest they will have difficulty in raising sufficient capital to meet their needs. Several of these CLECs provide last-mile DSL connectivity to companies like ours in competition with the former Bell Companies. Their viability maintains competition among our suppliers. If one or more of the CLECs with whom we do business, or with whom we may do business in the future, were to leave the marketplace, it may adversely impact our business and financial prospects.

Although some of the Telecommunications Act is self-executing, the FCC has issued a variety of regulations upon which we and other broadband competitors rely. We believe that the FCC's regulations and decisions have generally favored competition and the wide availability of DSL connectivity which we

Page 16
[HC005E][GDrive]

purchase in order to provide broadband services to our customers. However, these regulations and decisions have been and may continue to be appealed by one or more traditional telephone companies or other parties, which may lead to uncertainty and delays in implementation of regulations favorable to us, or which may adversely affect our business and financial prospects.

Broadband issues are also the subject of a number of proposed bills introduced in the U.S. Congress. To varying degrees, proposed legislation could either reduce or increase open access to the traditional Bell carrier networks as well as to the cable networks which have yet to be opened to the type of competition that exists in the telephone network. Many of the largest providers of broadband and Internet services, including AOL/TimeWarner, AT&T and the Bell companies, have been significantly involved in lobbying for and against this sort of legislation, which, if enacted, may affect our business and financial prospects.

For several years, traditional telecommunications carriers have argued that the FCC should repeal rules treating Internet service providers as unregulated providers of enhanced information services. Under this regulatory paradigm, Internet service providers have been subject to a lesser degree of regulation and taxation than traditional telephone service providers which is favorable to us. The FCC has to date resisted all efforts to modify the unregulated treatment of Internet service providers. However, there may be increased legal and political pressure on the FCC to modify these policies. While there is no indication that a major change in the FCC's policies is imminent, the imposition of access charges, universal service fees and other elements of traditional telecommunications regulation on Internet service providers would require us to review and possibly change our financial and business models.

Internet Content Regulation

Government regulation of communications and commerce on the Internet varies greatly from country to country. The United States has not adopted many laws and regulations applicable to online communications and commerce. However, it is possible that a number of laws and regulations may be adopted covering issues such as user privacy, freedom of expression, pricing, content and quality of products and services, taxation, advertising, gaming, intellectual property rights, enforceability of contracts and information security.

While sections of the Communications Decency Act of 1996, or the CDA, that proposed criminal penalties for distributing indecent material to minors over the Internet were held to be unconstitutional, other provisions of the CDA remain in effect. Congress has since passed the Child Online Protection Act, or COPA, in an effort to remedy the deficiencies the Supreme Court identified in the CDA. It is unclear whether COPA will survive constitutional challenges that have been raised. However, indirect legislation and other government efforts to regulate Internet content could subject us or our customers to potential liability, which in turn could affect our business. The adoption of these laws or regulations might also decrease the rate of growth of Internet use, which in turn could decrease the demand for our services or increase the cost of doing business or otherwise harm, results of operations, and financial condition. Likewise, the applicability to the Internet of traditional property ownership, copyright, taxation, libel and obscenity law is uncertain.

Likewise, the impact of ongoing discussions of privacy issues and the Internet remains uncertain. Several U.S. states have proposed, and the European Union has adopted, limitations on the use of personal information gathered online. Pursuant to negotiations with the European Union and the United States, the United States may decide to adopt restrictive laws on the subject of privacy. The Federal Trade Commission, or FTC, has initiated action and obtained a consent decree against at least one online service provider regarding the manner in which personal information is collected from users and provided to third parties. In 1998, Congress enacted the Child Online Privacy Protection Act (COPPA) protecting the privacy of children on the Internet and limiting the information that can be collected from and disseminated to children over the Internet without parental consent. The FTC promulgated broad new rules implementing COPPA in late 1999. Changes to existing laws or the passage of new laws intended to address online privacy and related issues may create uncertainty in the marketplace or could affect the manner in which we do business.

Page 17
[HC005F][GDrive]

We may also be subject to claims for defamation, negligence, copyright or trademark infringement (including contributory infringement) based upon information available through our Internet sites, including content created by third parties. Although recent federal legislation protects online services from some claims, the law in this area remains in flux and varies by jurisdiction. It is not possible to develop a business plan that can definitively protect us against liability for our Internet content, including content on our sites that we have not written or created. This uncertainty is likely to prevail for some time, as the laws continue to develop.

RISK FACTORS

You should carefully consider the risks described below before making an investment decision. The risks and uncertainties described below are not the only one that we face. Any of the following risks could harm our business, financial condition or results of operations. In such case, the trading price of our common stock could decline, and you may lose all or part of your investment. This Form 10-K also contains forward-looking statements that involve risks and uncertainties. Our actual results could differ materially from those anticipated in the forward-looking statements as a result of factors that are described below and elsewhere in this Form 10-K.

IF WE FAIL TO COMPLETE THE MERGER WITH HUGHES AND DIRECTV BROADBAND INC., OUR STOCK PRICE AND FUTURE BUSINESS OPERATIONS COULD BE HARMED.

On December 21, 2000, we signed a merger agreement with HUGHES Electronics Corporation and its wholly owned subsidiary, DIRECTV Broadband Inc. Under the terms of the merger agreement, DIRECTV Broadband Inc. has commenced a cash tender offer to purchase all of the outstanding shares of our common stock at a price per share of $2.15; if the tender offer is closed, the agreement provides for a follow-on merger with a subsidiary of HUGHES with our remaining stockholders receiving $2.15 per share in cash. There can be no assurance that the tender offer will be consummated; the closing of the tender offer is subject to customary conditions. If the tender offer is not completed for any reason, we may be forced to discontinue operations, as we only have enough cash on hand to continue operations until April 15, 2001, and we would have substantial additional expenses arising from the termination of the merger with HUGHES.

Further, the current price of our common stock could decline, particularly to the extent that it reflects a market assumption that the tender offer will not be completed. In addition, we are required to pay substantial fees related to the negotiation of the merger agreement, including legal and accounting fees, and the expenses and fairness opinion fee of our financial advisor; these must be paid even if the tender offer or the follow-on merger is not completed. We may be required to pay HUGHES a termination fee up to $8.1 million if the merger agreement is terminated under some circumstances as outlined in the merger agreement. The payment of these substantial fees would have a material and adverse effect on our cash position, which could harm our business and results of operations.

In addition, our customers may, in response to the announcement of the tender offer, delay or defer decisions concerning purchasing our products. Any delay or deferral in those decisions by our customers or suppliers could have a material adverse effect on our business, regardless of whether the merger is ultimately completed. Similarly, current and prospective employees may experience uncertainty about their future roles with HUGHES until HUGHES' strategies with regard to Telocity are announced or executed. This may adversely affect our ability to attract and retain key management, sales, marketing and technical personnel.

Furthermore, if the merger is terminated and our board of directors determines to seek another merger or business combination or other financing options, there can be no assurance that it will be able to find a partner willing to pay an equivalent or more attractive price than the price to be paid in the merger.

Page 18
[HC005G][GDrive]

AT PRESENT, WE CANNOT PROVIDE OUR SERVICES UNLESS DSL ACCESS PROVIDERS SUPPLY US WITH DSL CONNECTIONS AND COOPERATE WITH US FOR THE TIMELY PROVISION OF DSL CONNECTIONS FOR OUR CUSTOMERS.

We must obtain DSL connections from traditional telephone companies and new competitive carriers and have their continuing cooperation for the timely provision of DSL connections for our customers in order for us to provide our services. DSL operates over local telephone lines, which are under the control of traditional telephone companies and new competitive carriers and requires a special connection from our network to the telephone lines. We rely on them to provide us with these DSL connections, and if we were unable to use these connections, we would not be able to provide our services. In addition, we depend on traditional telephone companies and new competitive carriers to test and maintain the quality of the DSL connections that we use. An inability to obtain adequate and timely access to DSL connections on acceptable terms and conditions from traditional telephone companies and competitive carriers and to gain their cooperation in the timely provision of DSL connections for our customers could harm our business, as could their failure to properly maintain the DSL connection we use.

MANY OF OUR VENDORS OR SUPPLIERS MAY NOT HAVE THE RESOURCES TO SUSTAIN THEIR BUSINESSES AND MAY NOT BE ABLE TO PROVIDE COMPONENT PARTS FOR OUR INFRASTRUCTURE OR DSL CONNECTIONS FOR OUR CUSTOMERS

Many of our vendors or suppliers, including our DSL access providers, are facing serious financial difficulty. With the recent economic slow down and the down turn in the DSL market, many of these vendors or suppliers are forecasting that their revenue for the foreseeable future will be lower than anticipated, and some of these vendors and suppliers are experiencing, or are likely to experience, serious cash flow problems, even bankruptcy. If some of these vendors or suppliers are not successful in generating sufficient revenue or securing alternate financing arrangements in order to sustain their operations, they may not be able to supply us with components for our infrastructure or DSL connections for our customers. If any of these failures occur, we may not be able to provide continued service to existing customers or install our service for new customers and further, we may be exposed to technical obsolescence for certain types of our gateway. For example, Northpoint Communications, Inc., one of our DSL access providers, recently filed for bankruptcy and is shutting down most of its DSL networks. Telocity will likely be forced to interrupt service to approximately 19,700 customers delivered service through Northpoint. We are diligently seeking to reprovision the affected customers; however, it is likely that a substantial number of these customers may choose to terminate their relationship with Telocity. The failure of our vendors or suppliers to provide us with component parts for our infrastructure or DSL connections for our customers will harm our business and will adversely affect our operating results.

WE WILL COMPETE WITH OUR DSL ACCESS PROVIDERS IN PROVIDING BROADBAND INTERNET ACCESS, WHICH MAY CAUSE DELAYS, INCREASE EXPENSES, OR ADVERSELY IMPACT OUR MARGINS.

Because in some instance our DSL access providers will also provide broadband Internet access and other services, we compete with them. Although our DSL access providers are required to provide DSL connections to us on a non-discriminatory basis under the Telecommunications Act of 1996, they may nevertheless be reluctant to cooperate with us. Compelling these DSL access providers to meet the regulatory requirements may be expensive and time-consuming and could result in delays and increased expenses associated with providing our services and content on a wider scale, which in turn could harm our business. In view of the comparative size of the traditional telephone companies, we may also be vulnerable to predatory pricing which could force us to either forgo orders because we operate at a comparative price disadvantage, or reduce our prices, thereby adversely impacting our margins and our long-term profitability.

Page 19
[HC005H][GDrive]

OUR FAILURE TO MANAGE OUR GROWTH COULD HARM OUR ABILITY TO RETAIN AND GROW OUR CUSTOMER BASE AND EXPAND OUR SERVICE OFFERINGS.

We may not be able to install management information and control systems in an efficient and timely manner, and our current or planned personnel, systems, procedures and controls may not be adequate to support our future operations. Failure to manage our future growth effectively could harm our ability to retain and grow our customer base and expand our service offerings which would materially and adversely affect our business, prospects, operating results and financial condition.

CUSTOMERS MAY NOT ACCEPT THE VALUE ADDED SERVICES WE ARE CURRENTLY DEVELOPING. IF THESE SERVICES DO NOT GAIN BROAD MARKET ACCEPTANCE, WE WILL NOT BE ABLE TO INCREASE OUR REVENUES AND BUILD OUR BUSINESS AS ANTICIPATED.

We are currently developing a range of value-added services which include firewall and other internet safety features; multiple computer support; unified messaging; and consumer related content and voice services. Broadband services are a new and emerging business, and we cannot guarantee that these services will attract widespread demand or market acceptance. If this market fails to develop or develops more slowly than anticipated, we will not be able to increase our revenues, build our business, or improve our margins as anticipated.

BECAUSE OUR CUSTOMER ACQUISITION COSTS ARE HIGH, IF WE FAIL TO RETAIN CUSTOMERS LONG ENOUGH TO PAY BACK OUR UP FRONT INVESTMENT, WE MAY NOT ACHIEVE PROFITABILITY.

Our customer acquisition costs comprise a significant portion of our operating costs, including advertising, order fulfillment, installation, customer care, and the cost of our residential gateway. Because of our significant up-front investment in each customer, if our customers terminate their relationships with us before we recover our up front costs, we may fail to generate a profit. In addition, if we fail to reduce our customer acquisition costs, including by increasing the efficiency of our customer care organization and reducing the costs associated with the development and production of our gateways, our operating results will suffer.

OUR ABILITY TO REDUCE THE COST OF RESIDENTIAL GATEWAY IS DEPENDENT UPON ACHIEVING A SUFFICIENT VOLUME OF PRODUCTION, IF WE FAIL TO ACHIEVE THE REQUIRED LEVEL OF PRODUCTION THEN WE MAY BE UNABLE TO REALIZE THE COST REDUCTIONS THAT WE ARE ANTICIPATING, THEREBY REDUCING OUR FUTURE PROFITABILITY.

Anticipated reductions in the cost of our residential gateway are largely dependent upon our ability to continue to grow our subscriber base at current rates. If we are unable to grow our subscriber base at current rates then we will be unable to secure the forecast cost reductions in our gateway, thereby adversely impacting our future anticipated operating results.

OUR GROWTH DEPENDS ON OUR ABILITY TO HIRE AND RETAIN HIGHLY QUALIFIED EMPLOYEES AND SENIOR EXECUTIVES.

The loss of the services of any of our senior management team, all but one of whom are at-will employees, the failure to attract and retain additional key employees, or the ability to maintain the morale and enthusiasm of our employees could harm the continued deployment of our services and content, the marketing of our services and the development of new services, our brand and our strategy. Our future growth and ability to sustain this growth depend upon the continued service, morale and enthusiasm of our executive officers and other key engineering, sales, operations, marketing and support personnel.

OUR OPERATING RESULTS ARE LIKELY TO FLUCTUATE SIGNIFICANTLY FROM PERIOD TO PERIOD, WHICH MAY CAUSE OUR STOCK PRICE TO BE EXTREMELY VOLATILE. WE MAY

Page 20

EXECUTIVE OFFICERS AND DIRECTORS

The following table sets forth certain information with respect to our directors, executive officers and other key employees as of December 31, 2000.

<TABLE>

NAME	AGE	POSITION
Patti Hart	44	President, Chief Executive Officer and Director
Peter Olson	58	Executive Vice President, Chief Technical Officer and Director
David Finley	35	Chief Operating Officer
Edward Hayes	45	Executive Vice President and Chief Financial Officer
Scott Martin	44	Executive Vice President, Chief Administrative Officer and Corporate Secretary
Jim Morrissey	51	Executive Vice President and Chief Marketing Officer
Kevin Grundy	43	Senior Vice President, Engineering
Thomas Obenhuber	45	Senior Vice President, Corporate Development
Regina Wiedemann	39	Senior Vice President, Business Development
Vicki Foshee	43	Senior Vice President, Service Delivery & Support
Robert Sandor	47	Senior Vice President, Operations
David Wilson	33	Vice President, Financial Services
David Cowan	34	Director
Christie Hefner	48	Director
Andrew Rappaport	43	Director
Elisabeth Sami	32	Director
James Scheinman	34	Director
Michael Solomon	48	Director
Randall Strahan	48	Director

Patti Hart has served as President, Chief Executive Officer and as a member of the Company's Board of Directors since June 1999. From February 1994 through April 1999, Ms. Hart was at Sprint Corporation, where she most recently served as President and Chief Operating Officer of Sprint Corporation's Long Distance Division. At Sprint, Ms. Hart also served as President of Sprint Business, President of Sales and Marketing, and President of the Business Services Group. Ms. Hart is a member of the board of directors of Vantive Corp., which was acquired by PeopleSoft, and Premisys Corp.

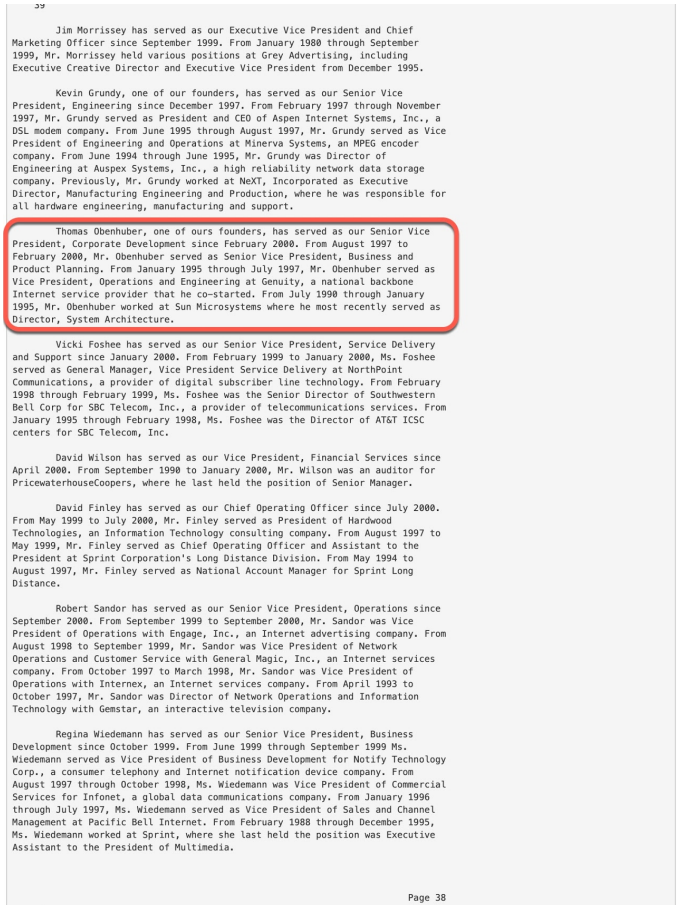
Peter Olson, one of our founders, has served as our Executive Vice President and Chief Technical Officer since July 1998. Previously, Mr. Olson served as our President and Chief Executive Officer from our incorporation in August 1997 until July 1998. Mr. Olson has served on our Board of Directors since August 1997. From June 1982 through December 1994, Mr. Olson served as Chief Technical Officer of Octel Communications Corporation, a company he co-founded. Mr. Olson is a member of the board of directors of Flycast Communications Corp., IMP, Inc. and Netpulse Communications, Inc.

Edward Hayes has served as our Executive Vice President and Chief Financial Officer since January 2000. From July 1996 through December 1999, Mr. Hayes worked at Lucent Technologies Inc., where from July 1997 he served as Financial Vice President and Chief Financial Officer of Lucent's Global Service Provider Business. From July 1995 through July 1996, Mr. Hayes worked at Unisys Corporation, where from November 1995 he served as Vice President, Chief Financial Officer and Chief Information Officer of Unisys' Global Professional Services Division. From April 1990 through July 1995, Mr. Hayes worked at ASEA Brown Boveri (ABB), Inc. the U.S. subsidiary of the joint venture between ASEA and BBC Brown Boveri, where from September 1993 he served at Vice President, Chief Financial Officer and Chief Information Officer of ABB Nuclear Operations.

Scott Martin has served as our Executive Vice President, Chief Administrative Officer and Corporate Secretary since December 1999. From October 1982 through August 1999, Mr. Martin held various positions at Van Kampen Investments Inc., including Senior Vice President and Deputy General Counsel from January 1995.

Page 37

Page 37
[HC005J][GDrive]



Jim Morrissey has served as our Executive Vice President and Chief Marketing Officer since September 1999. From January 1980 through September 1999, Mr. Morrissey held various positions at Grey Advertising, including Executive Creative Director and Executive Vice President from December 1995.

Kevin Grundy, one of our founders, has served as our Senior Vice President, Engineering since December 1997. From February 1997 through November 1997, Mr. Grundy served as President and CEO of Aspen Internet Systems, Inc., a DSL modem company. From June 1995 through August 1997, Mr. Grundy served as Vice President of Engineering and Operations at Minerva Systems, an MPEG encoder company. From June 1994 through June 1995, Mr. Grundy was Director of Engineering at Auspex Systems, Inc., a high reliability network data storage company. Previously, Mr. Grundy worked at NeXT, Incorporated as Executive Director, Manufacturing Engineering and Production, where he was responsible for all hardware engineering, manufacturing and support.

Thomas Obenhuber, one of ours founders, has served as our Senior Vice President, Corporate Development since February 2000. From August 1997 to February 2000, Mr. Obenhuber served as Senior Vice President, Business and Product Planning. From January 1995 through July 1997, Mr. Obenhuber served as Vice President, Operations and Engineering at Genuity, a national backbone Internet service provider that he co-started. From July 1990 through January 1995, Mr. Obenhuber worked at Sun Microsystems where he most recently served as Director, System Architecture.

Vicki Foshee has served as our Senior Vice President, Service Delivery and Support since January 2000. From February 1999 to January 2000, Ms. Foshee served as General Manager, Vice President Service Delivery at NorthPoint Communications, a provider of digital subscriber line technology. From February 1998 through February 1999, Ms. Foshee was the Senior Director of Southwestern Bell Corp for SBC Telecom, Inc., a provider of telecommunications services. From January 1995 through February 1998, Ms. Foshee was the Director of AT&T ICSC centers for SBC Telecom, Inc.

David Wilson has served as our Vice President, Financial Services since April 2000. From September 1990 to January 2000, Mr. Wilson was an auditor for PricewaterhouseCoopers, where he last held the position of Senior Manager.

David Finley has served as our Chief Operating Officer since July 2000. From May 1999 to July 2000, Mr. Finley served as President of Hardwood Technologies, an Information Technology consulting company. From August 1997 to May 1999, Mr. Finley served as Chief Operating Officer and Assistant to the President at Sprint Corporation's Long Distance Division. From May 1994 to August 1997, Mr. Finley served as National Account Manager for Sprint Long Distance.

Robert Sandor has served as our Senior Vice President, Operations since September 2000. From September 1999 to September 2000, Mr. Sandor was Vice President of Operations with Engage, Inc., an Internet advertising company. From August 1998 to September 1999, Mr. Sandor was Vice President of Network Operations and Customer Service with General Magic, Inc., an Internet services company. From October 1997 to March 1998, Mr. Sandor was Vice President of Operations with Internex, an Internet services company. From April 1993 to October 1997, Mr. Sandor was Director of Network Operations and Information Technology with Gemstar, an interactive television company.

Regina Wiedemann has served as our Senior Vice President, Business Development since October 1999. From June 1999 through September 1999 Ms. Wiedemann served as Vice President of Business Development for Notify Technology Corp., a consumer telephony and Internet notification device company. From August 1997 through October 1998, Ms. Wiedemann was Vice President of Commercial Services for Infonet, a global data communications company. From January 1996 through July 1997, Ms. Wiedemann served as Vice President of Sales and Channel Management at Pacific Bell Internet. From February 1988 through December 1995, Ms. Wiedemann worked at Sprint, where she last held the position was Executive Assistant to the President of Multimedia.

2001 (Jan 05) - Telocity's CFO outlines competitive landscape (full interview) - Edward Hayes, Executive Vice President And CFO, Telocity

https://www.totaltele.com/373086/Telocitys-CFO-outlines-competitive-landscape-full-interview

2001-01-05-total-tele-com-telocity-cfo-outlines-competitive-landscape.pdf

EDWARD (NED) HAYES is Executive Vice President and Chief Financial Officer of Telocity, Inc. Mr. Hayes brings 20 years of financial management and business decision support experience to Telocity. He is the company's first Chief Financial Officer and has held that position since January 2000. He joined Telocity's management team from Lucent Technologies, where he was most recently Financial Vice President and Chief Financial Officer for the Global Service Provider Business - Lucent's sales, marketing and execution arm, responsible for supplying incumbent and emerging telecommunication and data networking carriers around the globe, generating approximately $20 billion in annual sales. Prior to joining Lucent, Mr. Hayes held Senior Financial Management positions with such diverse multinationals as Unisys Corporation, Asea Brown Boveri (ABB), and Credit Suisse First Boston. He received his undergraduate degree from Colgate University and conducted his graduate studies in Accounting and Finance at New York University's Graduate School of Business. TWST: Start us off with a short overview and profile of Telocity.Mr. Hayes: Telocity was formed based on a belief that high-speed communications and multimedia-rich content would become more widely available to residential customers, similar to the way businesses currently enjoy intelligent, high-speed delivery of voice, video and data over their corporate networks. This vision was that of founders Peter Olson, a communications industry veteran and co-founder of voice-messaging leader, Octel; Kevin Grundy, Telocity's Senior Vice President in charge of Engineering, formerly a senior executive with Next Computer and Minerva Systems; and **Thomas Obenhuber, Senior Vice President of Corporate Development for Telocity, previously Vice President Operations and Engineering at Genuity. In 1997 Peter, Kevin and Thomas began work on an intelligent residential gateway. It was envisioned at the time that this device would be a residential hub that would enable secure, high-speed communications and commerce to the home**...

2001 (June 12) - Telocity became DirectTV

nexttv.com/news/telocity-changes-name-directv-dsl-158877

Telocity Changes Name to DirecTV DSL

By MONICA HOGAN June 12, 2001

Digital-subscriber-line service provider Telocity Inc. officially announced its new service name Tuesday, DirecTV DSL. Telocity is also changing its company name to DirecTV Broadband Inc.

DirecTV Inc. parent Hughes Electronics Corp. closed its purchase of Telocity in April, and it has promoted the new brand on a limited basis through direct mail and on DirecTV's Web site.

Ned Hayes, president and CEO of DirecTV Broadband, said DirecTV DSL is just the first of many DirecTV-tagged names that will be introduced as the company unveils new features to take advantage of the broadband service, such as home networking.

The company plans first to introduce the new DirecTV DSL brand to its high-speed Internet customers, as well as to its video customers, through electronic-mail and direct-mail campaigns. DirecTV DSL also plans radio campaigns in key markets within the next few weeks, and the company is working with DirecTV on an infomercial for its satellite-TV customers.

Next month, the company hopes to test its first retail introduction of DirecTV DSL. While Hayes said the specific retailer had not yet been signed, he added that it was likely to be one of the existing DirecTV retailers, such as Best Buy Co. Inc., RadioShack Corp. and Circuit City Stores Inc.

2003 (May) - Divorce Filing, Thomas Obenhuber vs Christine Obenhuber

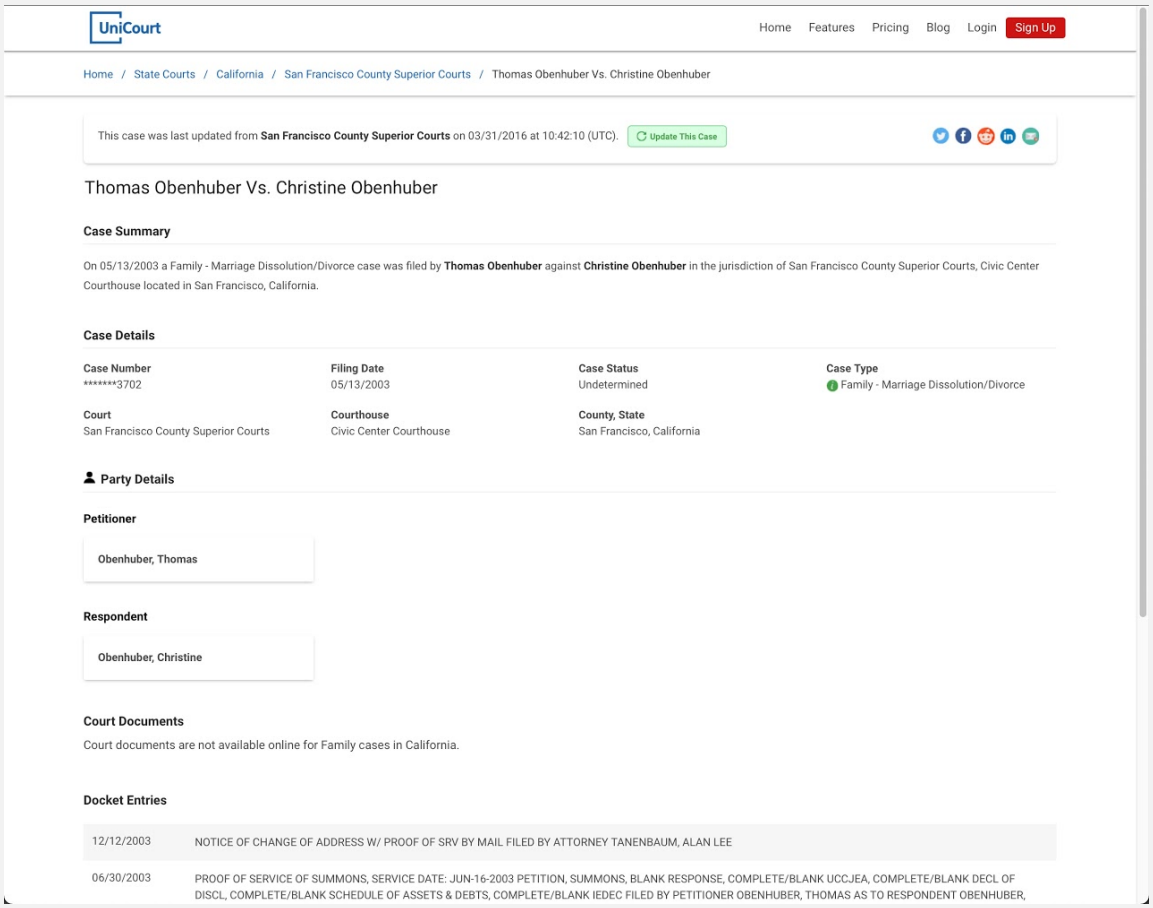
2003-05-13-unicourt-thomas-obenhuber-vs-christine-obenhuber.jpg



2003 (Oct 13) - EDN : Board design revamped

https://www.edn.com/board-design-revamped/

San Jose, Calif. – A 19-person startup is pitching concepts for revamping high-end printed-circuit-board and chip-packaging design to hit board-level data rates up to 40 Gbits/second at the cost of current 2.5-Gbit/s interconnects. **SiliconPipe Inc.,** based here, hopes to sell its intellectual property to a key OEM or contract manufacturer within the next six months.

SiliconPipe takes the radical notion of using twinax and coax cables to create a clean channel for a backplane that delivers twice to five times the data rate of pc-board traces over existing connectors.

At the line card level, the two-year-old startup says that it is developing four chip packages that can deliver data rates of as much as 20 Gbits/s using flex circuits, direct die attach and other techniques that the company has not yet fully disclosed

The new physical channels allow board designs to run high-speed signals, generally using existing techniques such as common-mode logic in current power envelopes of 60 to 100 milliwatts.

“Today, a Cisco router might use a 50- or 60-layer pcb costing as much as $20,000 for the backplane and requiring sophisticated counterboring techniques that only five or six companies in the world can handle,” said Para Segaram, chairman and chief technology officer of SiliconPipe. “We think we know how to make such boards at a fraction of the cost. If you are the purchasing person at Cisco, you will love this because you will be able to go to 300 companies who could make your backplane board.

The new approach also could eliminate months of engineering work that communications OEMs spend checking bit error rates and signal integrity on each trace of their backplane boards.

The trick for SiliconPipe is to convince a large OEM or contract manufacturer to invest in gearing up for its relatively simple but radically different way of making such high-end boards. Indeed, one senior engineering manager at Cisco Systems Inc. said native 10-Gbit/s backplanes were not a top design priority at this point.

“Over a decade ago, people were embedding coax cable into pcb fabrication processes for specialized government contracts. There might be a way to commercialize something like this, but I don't see us using it for a long time,” said Bill Jennings, a senior engineer in Cisco's networking group.

While most of the backplanes in Cisco's products now run at 3.125 Gbits/s, the company hits 40-Gbit rates in some line cards by aggregating the signals. Moving to a native 10-Gbit backplane is less important than getting Layer 3 switching silicon up to 10-Gbit rates and providing thermal management for high-end systems, Jennings said.

Inside the pipe

SiliconPipe has developed connectors that mate with Teradyne Inc.'s HSD and GSD backplane connectors. The Silicion Pipe connectors provide leads to which third-party manufacturers can attach conventional twinax cables. The cables can be bundled and shielded in what finally appears to be a pipe about the diameter of a penny. The resulting channel can deliver 15 to 20 Gbits/s.

The startup has also developed a method for attaching coax cables to its own backplane connector design to create backplanes that could hit 40-Gbit/s data rates.

To adopt the SiliconPipe technique, OEMs would lay out just power and ground signals on a 10- to 15-layer pc board, have a third party create the cable and backplane connector assembly based on the OEM's Gerber files, and then have the cables assembled onto the board.

Though the process steps are simple, they are not currently handled on high-volume production lines. Thus, SiliconPipe is talking with large OEMs and contract manufacturers about acquiring its intellectual property in preparation for offering such a service.

“All the things we do are standard manufacturing techniques; there's no tricks or specialty processes here,” said Thomas Obenhuber, vice president of product development for SiliconPipe.

Cabling the backplane traces gets users about 60 percent better system throughput, the company said. To get the other 40 percent, new packaging techniques would need to be employed to route signals from a line card's connector at least to the card's main ASIC.

SiliconPipe claims to have four such packages in development, though it is cagey about discussing them while some patents are still in the application process. One of the packages involves extending a flex-circuit lead from the line card connector to lead frames that extend from the ASIC's die right to the outside of the package, essentially avoiding the package substrate.

Segaram claimed that a 130-nanometer die typically provides up to 10-Gbit/s throughput, but chip packaging typically slows that rate significantly.

“If you put a probe right on a ball connection at the base of a chip, you will see about 30 percent of the signal eye is already closed,” Obenhuber said.

2003 (Dec 15) - Los Altos Town Crier : "I-280 car crash claims one life off Magdalena"

I-280 car crash claims one life off Magdalena

Published: 23 December 2003 Written by Tim Seyfert - Town Crier Staff Writer

A fiery one-car crash on Interstate 280 in Los Altos Hills last week claimed the life of a San Francisco resident, marking the second fatal accident to occur on that particular stretch of highway in just over a month.

Thomas Obenhuber, 48, was driving a 1998 Toyota Dec. 15 when he apparently lost control of the vehicle at around 6:45 p.m. while traveling north on I-280 near Magdalena Ave.

For unknown reasons, the vehicle veered down a grassy embankment and hit a tree, where it caught fire with Obenhuber still inside, the California Highway Patrol reported.

Prior to the collision, witnesses said, the car was traveling in the middle lane at a speed of about 80 mph when it suddenly crossed over onto the right-hand shoulder and turned into the embankment, according to an official report.

Responding firefighters declared the driver dead at the scene. Investigators were still looking into the cause of the accident.

The tragedy was preceded by a similar incident on the I-280 Nov. 13, involving an Isuzu Rodeo that overturned just south of El Monte Road, killing driver Hanh Do, 19, and passenger Amber Bazan, 16, both of San Jose. Do was apparently trying to change lanes to avoid a collision,

A fiery one-car crash on Interstate 280 in Los Altos Hills last week claimed the life of a San Francisco resident, marking the second fatal accident to occur on that particular stretch of highway in just over a month.

Thomas Obenhuber, 48, was driving a 1998 Toyota Dec. 15 when he apparently lost control of the vehicle at around 6:45 p.m. while traveling north on I-280 near Magdalena Ave.

For unknown reasons, the vehicle veered down a grassy embankment and hit a tree, where it caught fire with Obenhuber still inside, the California Highway Patrol reported.

Prior to the collision, witnesses said, the car was traveling in the middle lane at a speed of about 80 mph when it suddenly crossed over onto the right-hand shoulder and turned into the embankment, according to an official report.

Responding firefighters declared the driver dead at the scene. Investigators were still looking into the cause of the accident.

The tragedy was preceded by a similar incident on the I-280 Nov. 13, involving an Isuzu Rodeo that overturned just south of El Monte Road, killing driver Hanh Do, 19, and passenger Amber Bazan, 16, both of San Jose. Do was apparently trying to change lanes to avoid a collision, according to reports.

Anyone with information on either accident is asked to contact the Redwood City California Highway Patrol office at 369-6261.

BIOGRAPHY

Inessa is a serial entrepreneur, business advisor, executive trainer, and angel investor who has spent many years identifying and connecting innovative companies and executives around the globe. As CEO and founder of Global Privat, Inessa drives technology investment and growth through a system designed for success. Global Privat is a boutique economic development firm focused on creating a global ecosystem among investors, universities, corporations and the innovative companies around the world. Founded in 2012 by Inessa, Global Privat educates and empowers board directors and executives of both public and private companies to create stable and scalable companies. Global Privat's experts identify, invest in and grow innovative companies. The team provides the professional development, advice and expertise investors, executives and entrepreneurs need to ensure their companies grow and thrive. The firm delivers educational programs, mentoring, board development, and investment opportunities on 3 continents for more than 600 companies, individuals and economic development agencies.

In addition to leading Global Privat, Inessa holds investments with Seraph Group, Astia Angels and Keiretsu Forum. She also serves on the board of several companies in both the arts and technology. In the past, Inessa was one of founding members of PC Magazine in Russia and Ambassador of the Media Institute for Social Change at the USC Cinematic School. She also holds several global patents. A graduate of Moscow University, her personal passion is to increase diversity within companies and in the corporate boardroom. Leveraging her experiences, Inessa coaches, advises and frequently speaks about ways women and minority executives can play key roles as investors and board executives. Bay Area Russians vote with fervor

AP/SERGEI KARPUKHIN

Communist leader *Gennady Zyuganov, right, emerges Sunday from polling booth. He received 32% of the vote.*

◆ *RUSSIA from A-1*

Yeltsin, Zyuganov must slug it out

for June 30.

Yeltsin met with aides to work out how to woo Lebed. Zyuganov has hinted that Lebed could be his prime minister in a future government, and suggested that the former paratrooper and Afghan war hero would suffer if he did not accept.

With 89 percent of the vote counted, 35 percent of voters were backing Yeltsin, whose democratic reforms have also spawned crime and corruption. Zyuganov, who promises a Russia with global might and the controlled economy of the Soviet era, got 32 percent, the Central Election Commission reported.

A visibly satisfied Lebed told Russian Television his strong performance was a personal victory and that he would disclose soon whether Yeltsin could count on his support. Some Yeltsin aides suggested Lebed could be the president's eventual successor.

Kremlin meeting

Yeltsin's strategists reportedly arranged a meeting at the Kremlin Monday between the president and Lebed, who could possibly be offered the defense ministry or a job as deputy prime minister with control of all security forces.

Yeltsin aide Alexander Shokhin suggested that Lebed could get a job specially created for him.

Zyuganov, who has long had his eye on Lebed, moved quickly to try to secure his support.

Communist ally Mikhail Lapshin, head of the Agrarian Party, said Zyuganov would offer the gruff ex-general the prime minister's job in the event of a Communist victory in the runoff.

Zyuganov said no formal offer had been made and warned that Lebed's political career would be seriously damaged if he joined the Yeltsin government.

Yeltsin's presidency — and Russia's free-market reforms — may be riding on whether he can coax an endorsement out of Lebed that could help deliver his projected 10 million-plus votes.

"Victory in the second round will happen only if a coalition (with Lebed) actually happens and if turnout stays the same or goes up," Vyacheslav Nikonov, Yeltsin's chief campaign analyst, told Russian Public Television.

By law, a runoff must be held within 15 days of the release of final results. Alexander Ivanchenko, deputy head of the Central Election Commission, said the runoff was tentatively set for June 30.

Courting the also-rans

Yavlinsky, who stood fourth with 7 percent, also will be courted by Yeltsin although many of his supporters are all but certain to vote for the reform-minded president.

Zhirinovsky, who finished third behind Yeltsin in the 1991 presidential election, stood fifth with 6 percent. Many of his backers are likely to shift to Zyuganov.

None of the other five candidates got even 1 percent. Former Soviet President Mikhail Gorbachev got only 0.52 percent.

About 70 percent of Russia's 106 million voters cast ballots; Yeltsin's backers had hoped for more, believing a high turnout would help them against the better-organized Communists.

In the Moscow mayoral race, Yeltsin ally Yuri Luzhkov, who has presided over a construction boom that has transformed Russia's capital, was re-elected with nearly 90 percent of the vote.

In a television address to the nation Monday morning, Yeltsin said the choice in the next round was crystal clear and urged voters to unite behind him.

"Either backwards to revolutions and shocks, or forward to stability and well-being. Today as never before, we must be united," said Yeltsin, speaking in a strong, clear voice.

Sunday's voting followed a bitter campaign, offering what many voters found to be only unpleasant choices. But election day passed without riots, coups, widespread voter fraud or violence.

The dramatic changes that have taken place in Russia since the Soviet collapse in 1991 have created a new wealthy class, but have driven many into poverty.

Crime and corruption have flourished, and Yeltsin has been unable to end an 18-month-old bloody war in breakaway Chechnya.

Zyuganov appealed to those dispossessed by the reforms and those yearning for order.

"I am a pensioner, and it is a hard life," Nina Yesimova, 62, said after casting her vote for Zyuganov. "My pension is 400,000 rubles ($80) a month. I can't live on it."

Others disagreed.

"If the Communists win, it will be all the horror of before," said Alexandra Milyana, 70, describing her father's arrest and disappearance in Stalin's purges of the 1930s. "I'm old, but I can't go back."

'Just and honest'

Andras Barsony, the head of an observer delegation from the Organization for Security and Cooperation in Europe, said Monday that no serious violations were reported.

"The first round of the election took place in a just and honest atmosphere on the whole," he said, according to the Interfax news agency.

U.S. Sen. John McCain, R-Ariz., said the observer team from the International Republican Institute saw no pattern that would indicate widespread problems with the voting.

But campaign financing and spending, and the favoritism of the media toward Yeltsin during the campaign were troubling, he said.

"Both the election and the runoff will be the litmus test as to the true function of democracy in Russia," McCain said.

Yeltsin wins easily among local émigrés; Zyuganov is 3rd

By Keay Davidson
OF THE EXAMINER STAFF

Boris Yeltsin was a landslide winner — in San Francisco, anyway.

More than 1,700 Russians who live in the Bay Area jammed the Russian Consulate on Green Street Sunday. There they voted in their native land's anxiously watched election — an election that some feared would restore the communists to power or trigger a civil war.

"So many people!" Deputy Consul General Vladimir Golubkov declared, raising his hands in amazement as people flooded up the consulate steps. "We didn't expect so many people."

A final unofficial vote total showed 1,403 for Yeltsin, 164 for liberal reformer Grigory Yavlinsky, 73 for communist Gennady Zyuganov and 64 for Gen. Alexander Lebed. Flamboyant nationalist Vladimir Zhirinovsky failed to win a single vote, according to Sergei Gritsai, press attaché and vice consul in San Francisco.

Gritsai said the ballots are being flown to Moscow for double-checking before they are counted among the results. Only persons with confirmed Russian citizenship were eligible to vote in the election.

The Russian émigré community in the greater Bay Area is about 35,000, according to Lisa Greenberg of the Jewish Family Center in San Francisco.

"Who shall I vote for? Who else *except* Yeltsin?" asked an elegantly dressed young woman, Inessa Bamberg, a former resident of Russia who works in the sales department at Nordstrom in Corte Madera. "This election is going to be a big step toward a really big democracy."

All day Sunday the throng crept toward the voting booths — past lemon-yellow walls previously decorated with paintings of Lenin, paintings removed after the Soviet Union collapsed in 1991.

Yeltsin was their overwhelming choice, saying they deplored the possibility of a return to Communist rule.

By Monday, Yeltsin and his Communist opponent Gennady Zyuganov appeared headed for a June runoff election, neither candidate having won more than 50 percent of the vote.

Bay Area Russian voters also dismissed presidential candidate Vladimir Zhirinovsky — whom Western news media have portrayed as a flamboyant anti-Semite — as a trivial fringe candidate.

"Zhirinovsky doesn't have a chance, like (U.S. presidential candidate Pat) Buchanan didn't have a chance over here," said Mikhail Utkin of Reno, who drove to San Francisco for the election.

Why did he undertake such a long drive just to vote?

"Because when I go back home, I want to go home to a nice place, free and wealthy," insisted Utkin, 24, a computer science student at the University of Nevada at Reno. "I don't want to go back to a large prison."

For now, many grumbled, the "inmates" appear to be running the "prison."

While living in Russia, Bamberg was twice beaten by agents of the so-called Russian Mafia because her husband refused to pay them 30 percent of his profits, she said.

Disgusted, the Bambergs moved to the Bay Area three years ago.

The ultimate election of Zyuganov would be bad news, said Andrew Bamberg, who sells Toyotas in San Rafael.

'No way to re-establish socialism'

It also would be pointless, he added.

"There's no way to re-establish socialism because all the old (societal) connections are broken and all the (Soviet Union's client states) are independent countries now."

"It is important that a democrat win — important for the whole world," said Lubov-Pitina Vcherashny, who with her husband, Boris, and daughter Julia came to vote. The Outer Richmond District residents have lived in San Francisco for about 18 months.

Julia, a student at San Francisco City College, said Zhirinovsky "is not a serious man. He has some fascist mentality."

A very unusual band of voters arrived at the consulate around noon, courtesy of a U.S. government chauffeur. They were Russian military inspectors and weapons scientists who — with the full permission of the U.S. government — lurk around U.S. military bases to be sure that the Americans aren't violating arms control treaties. Their U.S. counterparts lurk around Russian bases.

No longer secretive

Meanwhile, several feet away, officials of the once-super-secretive Russian Consulate — where, even today, no one ever seems to answer the telephone — readily opened their doors to the media. The lobby and hallway were so jammed with voters, though, that reporters and photographers had trouble making headway to the voting room.

There, before a big picture window with a view of the Golden Gate Bridge and Alcatraz Island, voters showed their passports to Russian officials. Then they retreated to a private booth to vote.

Doomsayers back home warned the election would trigger a civil war, perhaps akin to the famine-and-firestorm bloodbath that followed the Bolshevik Revolution of the late 1910s.

Such talk, Golubkov says, makes him very angry. "Maybe some minor clashes" will occur, but talk of a bigger conflict is "just putting oil on fire," the deputy consul general said, tapping a cigarette on a cigarette package.

"I never saw so much interest in voting," Golubkov said. "Today, the people will decide the political future of Russia."

Eric Brazil of The Examiner staff contributed to this report.

Former Securities Lawyer Sentenced To Six Years Of Imprisonment For Securities Fraud

Disbarred Marin attorney also ordered to pay more than $4.5 million in restitution to defrauded investors

SAN JOSE – James Seltzer, a former attorney and resident of Marin County, was sentenced to 72 months' imprisonment for securities fraud, announced United States Attorney Brian J. Stretch, FBI Special Agent in Charge John F. Bennett, and Internal Revenue Service, Criminal Investigation, Special Agent in Charge Michael T. Batdorf. The sentence, issued today by U.S. District Judge Lucy H. Koh, follows a guilty plea entered September 14, 2016.

According to his plea agreement, beginning no later than October of 2007 through at least May of 2011, Seltzer, 69, formerly of Belvedere, defrauded and deceived multiple individuals in connection with the purchase and sale of securities. Seltzer admitted he misrepresented to the investors that he would use their money to make certain investments for their exclusive benefit but instead diverted the funds to other uses. Seltzer acknowledged that in many cases, he diverted all or virtually all of the monies he had obtained from his investors and spent the monies on his own personal and business expenses after depositing the funds into his own personal bank accounts. The court found Seltzer defrauded 16 investors of more than $4.5 million and ordered Seltzer to pay restitution to his victims in the amount of $4,646,555.

According to papers filed by the government, Seltzer's victims included several women with whom he conducted personal relationships in order to gain their trust as a precursor to stealing from them. During today's sentencing proceedings, after hearing from several of Seltzer's victims, Judge Koh described Seltzer's conduct as "callous." Furthermore, in addition to the victims in his criminal case, bankruptcy filings reveal Seltzer accumulated a debt of well over $20 million to numerous other individuals. Seltzer fled the country in 2010 and remained overseas for 5 years.

On June 18, 2015, a federal grand jury indicted Seltzer charging him with five counts of securities fraud, in violation of 15 U.S.C. § 78; one count of mail fraud, in violation of 18 U.S.C. § 1341; and three counts of money laundering, in violation of 18 U.S.C. § 1957. He was apprehended in Hawaii in September 2015, and, pursuant to the plea agreement, pleaded guilty to one count of securities fraud. The remaining counts were dismissed.

In addition to the prison term and restitution, Judge Koh also sentenced Seltzer to serve a three-year period of supervised release. Judge Koh ordered Seltzer to surrender no later than April 19, 2017, to begin serving his sentence.

Assistant U.S. Attorneys Timothy Lucey and Arvon Perteet are prosecuting the case with the assistance of Laurie Worthen. The prosecution is the result of an investigation by the IRS-Criminal Investigation and the Federal Bureau of Investigation.

Dr. Lloyd J. Old, M.D., c. 1995

Lloyd John Old (September 23, 1933 – November 28, 2011) was one of the founders and standard-bearers of the field of cancer immunology.[1] When Old began his career in 1958, tumor immunology was in its infancy. Today, cancer immunotherapies are emerging as a significant advance in cancer therapy.[2]

Old's contributions to research established many of the principles and priorities of modern tumor immunology. In earlier work, he and his colleagues introduced Bacillus Calmette-Guérin (BCG) to tumor immunotherapy; discovered the first link between the major histocompatibility complex (MHC) and disease (leukemia); found the unexpected association between Epstein-Barr virus (EBV) and nasopharyngeal carcinoma; discovered Tumor necrosis factors (TNF); defined the concept of cell-surface differentiation antigens with the discovery of TL, Lyt (CD8), and a range of other mouse antigenic systems; discovered p53, independently with two other groups; and identified the tumor immunogenicity of heat shock proteins. Old is the author or co-author of more than 800 research publications. He was also a teacher helping young scientist as they began their career.

He held the William E. Snee Chair of Cancer Immunology at Memorial Sloan-Kettering Cancer Center (MSKCC), where he was director of the Ludwig Cancer Research New York Branch (then known as Ludwig Institute for Cancer Research, or LICR).[3] He was also a trustee of the LICR Charitable Trust, and a trustee of the Virginia & D.K. Ludwig Fund for Cancer Research.6. From 1971 to 2011, he served as the founding scientific and medical director of the Cancer Research Institute (CRI), where from 2001 to 2011 he also served as director of the CRI/LICR Cancer Vaccine Collaborative (CVC), an international network dedicated to testing and optimizing therapeutic cancer vaccines. Old's previous appointments included chairman of the LICR board of directors (2006–2009), LICR scientific director (1988 to 2005), member of the Emeritus LICR Scientific Committee (1971–86), LICR chief executive officer (1995–2004), and associate director of research at MSKCC (1973–83).

Old served as a member of scientific advisory boards and committees including the Public Health Research Institute of the City of New York, the National Cancer Institute, and the American Association for Cancer Research. Old was also a member of the American Association for Cancer Research, New York Academy of Sciences, Reticuloendothelial Society, Society of Experimental Biology and Medicine, American Association for the Advancement of Science, American Association of Immunologists, National Academy of Sciences, the Academy of Cancer Immunology, and the American Academy of Arts and Sciences. He had also received honorary doctor of medicine degrees from Karolinska Institute, the University of Lausanne, and the University College London. He graduated from the University of California, Berkeley with a B.A. in biology and earned a medical degree from the University of California, San Francisco.

Old died November 28, 2011, in his New York City home, after several years battling advanced prostate cancer.[1]

Major discoveries[edit]

This article **is in list format, but may read better as prose**. You can help by converting this article, if appropriate. Editing help is available. *(December 2019)*

- Introduced Bacille Calmette-Guérin (BCG), the tuberculosis vaccine, into experimental cancer research as a way to stimulate non-specific resistance to tumor growth. BCG was FDA-approved in 1991 and is now widely used as a first line treatment for superficial bladder cancer (1959).[4]
- Discovered the first linkage between the major histocompatibility complex (MHC) and disease—mouse leukemia—opening the way for the recognition of the importance of the MHC in the immune response (1964).[5]
- Identified the first cell surface antigens distinguishing cells of different lineages, introducing the concept of cell surface antigens that could differentiate different cell types. First coined TL (for "thymus-leukemia" antigen in mice) then later as the Ly series (originally named Ly-A and Ly-B and later called Ly-1, Ly-2, and Ly-3), this discovery led directly to the wide use of cell surface markers to distinguish and classify normal and malignant cells and the development of CD classification (for "clusters of differentiation"). Most notably, Dr. Old discovered the LY-B antigen, later renamed CD8 in humans. CD8 cells, often referred to as "killer" T cells, are one of the major cells of the adaptive immune response, and are capable of directly killing dangerous or foreign cells (1964–1968).[6][7][8][9][10]
- Discovery of the association between Epstein-Barr Virus (EBV) and nasopharyngeal cancer (1966).[11]
- Discovery of tumor necrosis factor (TNF), a key immune signaling molecule (cytokine) that, in addition to its promise for the treatment of cancer and other diseases, has provided a powerful research tool in biomedicine (nearly 88,000 articles in PubMed as of May 25, 2011) (1975).[12][13]
- Identification (independently, along with two other groups) of the p53 protein, the gene for which is mutated in approximately 50 percent of cancers (1979).[14]
- Conducting of the most comprehensive dissection of the cell surface of human cancers using monoclonal antibodies, with the identification of an array of cell surface antigens as targets for antibody-based therapies of human cancer. Of the monoclonal antibodies developed in Dr. Old's laboratory, thirteen have been licensed and seven are in clinical trials. These include:
  - MORAb-003 (farletuzumab), currently in a phase III trial for ovarian cancer sponsored by Morphotek, which licensed the antibody from LICR. MORAb-003 targets the folate receptor alpha, which is overexpressed on a number of epithelial cancers, including ovarian, breast, renal, lung, colorectal and brain cancers.
  - the anti-EGFr antibody Hu806, which Abbott Laboratories acquired exclusive world-wide rights to develop in a major licensing deal in 2008. Hu806 targets the overexpressed form of the epidermal growth factor receptor (EGFr) present in 50 percent of all cancers of epithelial origin.[15]
  - cG250 (girentuximab, Rencarex®/Redectane®), which targets the CA-IX molecule/G250 antigen, expressed on over 90 percent of clear cells renal cell carcinomas (RCC, kidney cancer), and is in phase III clinical trials as a diagnostic tool and as a therapeutic modality (also iodine-131-G250).
  - hu3S193, which targets the LeY antigen, an oligosaccharide epitope expressed on glycolipids and glycoproteins by a wide range of epithelial cancers, is in phase II clinical trials being conducted by LICR spin-off company Recepta Biopharma.
  - huA33, which targets the A33 antigen present on colorectal cancer cells. The antibody has been licensed to LICR spin-off company Life Sciences Pharmaceuticals, and the mAb's therapeutic potential is being tested as a stand-alone antibody, as a radioimmunotherapy agent, and in combination with chemotherapy.[16]
- Establishment of the autologous typing system as the methodology leading to the identification of the first specific human tumor antigens recognized by antibodies and T cells, created 150 separate cancer cell lines, and laid the groundwork for the development of SEREX by Pfreundschuh in 1995.[17]
- Discovery and naming of several members of the CT (cancer/testis) family of human tumor antigens, including New York-ESO-1 (NY-ESO-1). NY-ESO-1 is one of the most immunogenic human tumor antigens discovered to date and is expressed in approximately 35 percent of melanomas, 30 percent of breast cancers, 30 percent of liver cancers, 25 percent of lung cancers, less than five percent of colon cancers.[*citation needed*]
- Contribution to the resurrection of the cancer immunosurveillance hypothesis and to the development of the expanded model of cancer immunoediting.[18][19][20]
- Establishment in 2001 of the Cancer Vaccine Collaborative (CVC), the world's first network of clinical trial sites closely linked with immunological monitoring laboratories with the goal to develop effective therapeutic cancer vaccines by first understanding the fundamental immunological implications of vaccination and applying that knowledge toward the rational design of optimal vaccine formulations. A joint program of the Cancer Research Institute and Ludwig Cancer Research, the CVC conducts parallel, early phase, single variable clinical trials of various cancer vaccine formulations and combinations composed of cancer-specific antigen, immunological adjuvant, vaccine delivery platforms, and modulators of immune suppression.

- Founder of "The Academy of Cancer Immunology [which] was established in 1998 to advance understanding of the role of immunity in cancer and to recognize outstanding achievements in the field of cancer immunology. The Academy currently has 53 members from 11 countries and holds annual elections for Academy membership." [21]

Leadership[edit]

As director of the international Ludwig Institute for Cancer Research for 17 years, scientific director of the Cancer Research Institute for 40 years, and his previous appointment as associate director of research at Memorial Sloan-Kettering Cancer Center for 10 years, Dr. Old guided the scientific vision of several institutions and the training and development of generations of young scientists in many fields.[22]

Lloyd J. Old, M.D., c. 1974

Memorial Sloan-Kettering Cancer Center (MSKCC)

- Memorial Hospital for Cancer and Allied Diseases
  - 1973-1976: Vice president and associate director
  - 1976-1986: Vice president and associate director for scientific development
- Memorial Sloan-Kettering Cancer Center
  - 1973-1983: Associate director of research
- Ludwig Institute for Cancer Research, New York Branch at MSKCC
  - Director, 1990–2011

Ludwig Institute for Cancer Research (Ludwig Cancer Research)

- 1988-2005: Director
- 1989–present: Member, board of directors
- 1995-2004: Chief executive officer
- 2006-2008: Chairman, board of directors

Virginia and Daniel K. Ludwig Trust

Lloyd J. Old, M.D., with Cancer Research Institute founder Helen Coley Nauts, Cancer Research Institute (CRI)

- 1968-1971: Scientific advisor
- 1971-2011: Scientific director

CRI/LICR Cancer Vaccine Collaborative (CVC)

- 2001-2011: Director

Awards[edit]

- 1957: Roche Award from Roche Pharmaceuticals
- 1958: Alpha Omega Alpha
- 1970: Lucy Wortham James Award, James Ewing Society
- 1972: Lecturer, The Harvey Society of New York
- 1972: Louis Gross Award
- 1974: Member, Institute of Medicine, U.S. National Academy of Sciences
- 1975: Cancer Research Institute William B. Coley Award for Discoveries in Basic and Tumor Immunology (honored as one of the "Founders of Tumor Immunology")
- 1976: Member, American Academy of Arts and Sciences
- 1976: Rabbi Shai Shacknai Memorial Prize in Immunology and Cancer Research, Hebrew University of Jerusalem
- 1978: Member, National Academy of Sciences
- 1978: Research Recognition Award, Noble Assembly
- 1980: G.H.A. Clowes Memorial Award, the American Association for Cancer Research
- 1981: Robert Roesler de Villiers Award, Leukemia Society of America
- 1985: New York Academy of Medicine Medal for Distinguished Contributions in Biomedical Science
- 1986: Honorary member, Japanese Cancer Association
- 1990: Robert Koch Prize, Robert Koch Foundation
- 1994: Honorary Doctor of Medicine, Karolinska Institute
- 1995: Honorary Doctor of Medicine, University of Lausanne
- 1997: Honorary Doctor of Sciences (Medicine), University College London
- 2004: President's Medal, Johns Hopkins University
- 2004: Dean's Award, Stanford University School of Medicine
- 2004: Honorary professor, Peking University
- 2007: Charles Rodolphe Brupbacher Prize for Cancer Research, the Charles Rodolphe Brupbacher Foundation, Berlin
- 2011: C. Chester Stock Award Lectureship, Memorial Sloan-Kettering Cancer Center

Dr. Kevin Olival

Vice President for Research

@nycbat

"Our activities take us to the farthest reaches of the planet to monitor wildlife health and draw linkages between humans, animals, and ecosystems. My work with bats strives to both conserve these ecologically beneficial animals and understand their role in the emergence of human diseases - with the ultimate goal of preventing the next pandemic."

Scientists Bio

Dr. Kevin Olival is an ecologist and evolutionary biologist who has been researching emerging infectious diseases for over a decade. He has been at the forefront of recent international investigations to understand the origins and transmission pathways of: Middle East Respiratory Syndrome coronavirus (MERS-CoV) in Saudi Arabia; Ebola Reston virus in the Philippines; and Nipah virus in Bangladesh and Malaysia. He has managed wildlife conservation and disease research projects across Southeast Asia for over 10 years, with a strong focus on bat research. Dr. Olival's role as Senior Research Scientist at EcoHealth Alliance involves coordinating the modeling and analytics research; integrating evolutionary and ecological theories to understand the drivers of disease emergence; and managing zoonotic disease surveillance efforts in Thailand and Indonesia under the USAID PREDICT project.

Some highlights from Kevin Olival's research include detecting the first evidence for Ebola virus from bats in mainland Southeast Asia (Bangladesh); detecting MERS-CoV and related viruses in bats and advising the Institute of Medicine's Forum on Microbial Threats on this disease; understanding the circulation of Nipah virus in its natural fruit bat reservoirs; estimating viral diversity in mammals globally; and building models to predict zoonotic disease emergence. Dr. Olival has a unique blend of skills from the field, laboratory, and behind a computer that include ecological techniques to capture and survey bats, satellite telemetry of wildlife, field training courses in safe specimen handling and personal protective equipment (PPE), molecular biology techniques, phylogenetic analyses, and ecological modeling.

Dr. Olival graduated with distinction from Columbia University in 2008 with a Ph.D. in Ecology and Evolutionary Biology and a M.A. in Conservation Biology. His dissertation research focused on the population genetics and geographic distributions of large fruit bats in Southeast Asia, with implications for Nipah virus dynamics and emergence. He has conducted month-long expeditions to Southeast Asia doing fieldwork and managing projects working with local scientists and NGOs.

Dr. Olival completed a prestigious two-year NIH Fogarty U.S. Global Health Postdoctoral fellowship expanding EcoHealth Alliance's work on the ecology of Nipah virus in Bangladesh. Dr. Olival has a passion for turning rigorous science into effective public policy, and aims to keep this as a central goal of his career path.

His research has been highlighted in *The New York Times*, *The Economist*, *The Wall Street Journal*, *TIME* magazine, *Toronto Star*, *Wired*, and *National Geographic*.

2017 (February) - Zika Virus publication

Full PDF - [HI000Y][GDrive]

Incubus

Kevin J. Olival

EcoHealth Alliance, 460 West 34th Street, 17th Floor, New York, NY 10001

Zika is insidious. Its symptoms are overwhelmingly mild, inconspicuous, and even go unnoticed—a rash, a fever, a headache—sequela that could result from any number of causative agents. Yet, on rare occasion its impact can be disastrous—deforming and depriving the unborn. Because of this, Zika strikes a deep chord of terror in many millions more than it infects. Like HIV in the 1980s, it is changing societal behavior—how we engage in love, where we travel, when we travel, and, now, whether we reproduce. Zika virus oppresses our most primitive and instinctual biological desire—procreation.

Zika is an incubus. A nasty demon who preys on unexpecting young women in their sleep. Zika is an incubus. A nightmare—a horrific, tropical nightmare where mosquito bites beget babies with shrunken heads.

Zika is sexist. Zika is ageist. It disproportionately impacts women of child-bearing age, and young couples ready to start a family. It's one of few vector-borne diseases that is also transmitted sexually. The fear and uncertainty are much worse than the odds suggest. Microcephaly, blindness, developmental abnormalities, arthrogryposis, and Guillain-Barré each may be exceedingly rare, but the unknown terrifies us. Will I draw the unlucky card? What will we discover next about this disease? The wave of knowledge about this old viral foe is just beginning to swell, and, just ahead of it crests another wave—the Zika epidemic itself.

Mark Olival-Bartley's small and beautifully crafted poem, "Microcephaly," reminds us of all of this. In nine undulating lines of iambic pentameter, replete with imagery of biblical floods and oceanic depths, he conjures up the terror of a birthing woman who drew that unlucky card. In three short stanzas, the reader is taken on an epic journey from terror to grief to respite. It's the third and final stanza that is most interesting to me. We are left with, if only briefly, a feeling of hope. Some may interpret the reference to "adamantine faith" as the religious faith of the birthing woman; I interpret the reference as a faith in science. In less than two years, we have learned infinitely more about Zika virus than we knew in the 70 years since its discovery. We must have faith, that with science as our tool, we will knock this epidemic down. It seems a vaccine is around the corner; we've developed them for Zika's cousins—Yellow fever, Japanese encephalitis, and Dengue. Yet we need more than vaccines.

In the penultimate line of "Microcephaly," "the race of knowledge toward what lies ahead," we are reminded that this virus, like all emerging infectious diseases, will continue to surprise and challenge us. The virus has already spurred a large and growing scientific body of knowledge. The final line of the poem leaves us with further hope. As with other past epidemics, society will walk away damaged from Zika, "limping," but ultimately we will walk away and the dance (between pathogen and host?) will continue. Zika will make us smarter as a scientific community and better prepared as a society to deal with the next one. This too shall pass.

On this Issue's cover, Kuniteru Utagawa's 1885 woodblock print "Ten Realms within the Body" visually reminds us that both the hope and peril of society already lie in the hands of the unborn generation. A reclining woman points to her pregnant belly, cross-sectioned into 10 panels, each representing the ten spiritual realms of humanity. These are represented through the trials and joys of everyday life: transporting goods (humanity), teaching children in a classroom (learning), engaging in a fierce battle (hell), pulling a frail figure in a wagon (hunger), and gathering in a community circle (Buddhahood). In the center of all of this, appears her baby in utero. I can't help but see in this artist's rendition of baby a head too small, a sloping, and lowered braincase that differs from the other children depicted in the print. This is most likely an unintended artistic consequence—maybe Utagawa wanted the shape of the fetus to

Interested in #bats #conservation #coronaviruses #globalhealth and how all these things can successfully work together? With our team at EcoHealth Alliance, I've spent the last few years helping to build a network of bat ecologists, conservationists, virologists, and #onehealth researchers in Western Asia and proud to announce our new website launched today! Thanks to a generous grant from the Defense Threat Reduction Agency for allowing us to build this collaborative network. Check it out:

"

WAB-Net scientists participate in risk assessment of SARS-CoV-2 'spill-back' into bat populations from people

Summary: Two WAB-Net scientists, Dr. Kevin Olival (EcoHealth Alliance) and Dr. Tigga Kingston (Texas Tech University, and a member of the WAB-Net Scientific Advisory Board) recently participated in a risk assessment led by the US Fish and Wildlife Service, to determine the threat of SARS-COV-2 'spill back' from humans into bat populations. Researchers who capture and handle bats as part of their fieldwork could infect bat populations with the virus if they themselves are infected. The concern is twofold: Firstly, SARS-CoV-2 could negatively affect the health of North American bat populations – a significant concern, especially for those species already being decimated by the fungus causing white-nose syndrome. Secondly, if SARS-CoV-2 becomes established in North American bat populations, it would be difficult to eradicate the virus, and the bats could serve as a new reservoir for continued spillover into human populations."

1976 (Sep 16) - U.S. Investigating Loss of Notebook With Security Data

PDF content : [HN00DH][htGDrive]

THE NEW YORK TIMES, THURSDAY, SEPTEMBER 16, 1976

U.S. Investigating Loss of Notebook With Security Data

By NICHOLAS M. HORROCK
Special to The New York Times

WASHINGTON, Sept. 15—The Department of Justice is conducting an investigation to determine how a notebook, which contained national security information gathered on a foreign trip by one of President Ford's key intelligence advisers, was lost and fell into the hands of an ex-convict and self-styled journalist, Government officials said today.

The notebook, a three-by-five inch Government-issue tablet, was used by Cmdr. Lionel Herbert Olmer of the Navy to keep notes of the conversations of Leg Cherne, a member of the President's Foreign Intelligence Advisory Board, during a fact-finding mission in March 1975.

Mr. Cherne, who is now chairman of the board, said in an interview that he had been assigned to make the trip by the board's former chairman, Admiral George W. Anderson. A high Administration source said, however, that the trip had been ordered by Secretary of State Henry A. Kissinger, who then was also Mr. Ford's chief adviser for national security affairs.

Three Main Problems to Study

Mr. Cherne said that he was to study three main problems on the mission: the growing international energy crisis; the heavy unemployment being suffered by Western nations and the sharp shift of economic power to the oil producing nations.

As a "corollary matter," he said, he had been asked to determine whether disclosures about domestic activity by the Central Intelligence Agency raised by The New York Times in December 1974 had affected the ability of the United States to gather foreign intelligence.

Commander Olmer said in an interview that he had tried to keep careful and complete notes of what was said at each session during the trip, which occurred March 14-29, 1975. He is an intelligence officer and a specialiast in cryptology, or secret language.

Commander Olmer said he was sure the notebook was in his possession the entire time until at least 30 minutes before the Trans World Airlines flight he and Mr. Cherne were aboard on their return trip landed at Kennedy International Airport in New York.

Commander Olmer said he realized the book was missing when he arrived at his home in suburban Maryland the same day. After a search of his house, he immediately reported the loss to Wheaton Byers, executive secretary of the foreign advisory board.

Mr. Byers and Commander Olmer said that they tried unsuccessfully to locate the book through the airlines and other means. Mr. Byers said the loss was then reported to Admiral Anderson and to the Central Intelligence Agency, which determined that the contents were "classified" and that their publication "would be injurious to the national security of the United States."

Call from a Journalist

Mr. Cherne and Commander Olmer said in separate interviews that the contents might also be "embarrassing," as Mr. Cherne put it, since they included candid assessments by American officials of their superiors and foreign officials.

On July 24, 1975, Mr. Cherne said he received a call from Michael Casey, who identified himself as a free-lance journalist and who said he had the notebook.

Mr. Cherne said he had received "guidance" from Federal authorities he would not name (reportedly the F.B.I.) to "string him along, maintain contact, not to set too much value on the bock, to see if it could be recovered."

Mr. Casey, 32 years old, said in an interview that he had served time at Soledad penitentiary in California for passing forged checks and had been in prison for juvenile violations.

He said that he received the notebook from a man he would not identify aboard an Air Vietnam flight between Saigon and Hong Kong on April 23, 1975.

Mr. Casey has a record of helping Vietnamese refugees that has been confirmed by State Department and news officials. Because of this, he was retained by the International Rescue Committee in its Los Angeles office on August 18, 1975, according to Robert deVecchi, an official of the committee.

Mr. Cherne was chairman of the committee's board of directors at the time, but Mr. Casey said he did not realize that.

Mr. Casey pledged to return the notebook and on August 26, 1975, Mr. Cherne received the book by registered mail. It was at this time that the matter came under F.B.I. scrutiny.

Meanwhile, Mr. Cherne said, he had checked Mr. Casey's background with an official of the rescue committee in Hong Kong and was advised to "sever connections" with Mr. Casey immediately. He recommended that Mr. Casey be dismissed, and he was on September 18, 1975.

Mr. Casey said he met voluntarily with an assistant United States Attorney in New York in April and turned over some copies of portions of the book. He said he still possessed a copy, which he said was hidden. Mr. Casey offered to turn the copy over to The New York Times on the condition that he be retained to investigate its contents. No copy was ever made available to The Times.

Mr. Casey also said he had been interviewed by F.B.I. agents who are seeking the return of any and all copies of the book and the names of any journalists who may have seen the contents.

Reporter Given Documents

In September 1975 after returning the original copy of the notebook to Mr. Cherne, Mr. Casey showed Robert Dietrich, a reporter for The San Diego Evening Tribune, what he described as typewritten copies of the book's contents along with other purportedly secret documents allegedly obtained from the C.I.A.'s Air America office in Saigon.

Mr. Dietrich said he had a copy of the typewritten version but declined to discuss the contents in detail.

Mr. Casey said he and Mr. Dietrich set out to investigate the contents and that a series of threatening incidents ensued, including the burglary of his home in Los Angeles.

Casey Tells of Robbery

Mr. Casey said he met voluntarily with an assistant United States Attorney in New York in April and turned over some copies of portions of the book. He also said he had been interviewed by F.B.I. agents who are seeking the return of any and all copies of the book and the names of any journalists who may have seen the contents.

On Sept. 2, while staying at Washington's Mayflower Hotel, Mr. Casey reported to the police that he had been robbed at gunpoint of "about $850" and a tape-recording of a telephone conversation between himself and Mr. Cherne made in August 1976.

Both the Washington police and the major crimes unit of the United States Attorney's office here are investigating Mr. Casey's allegations.

Secret U.S. Notebook Returned From 'Sympathizers of Hearst'

WASHINGTON (AP) — The justice department is investigating the strange case of a missing notebook containing classified information that was returned to a top-ranking Ford administration intelligence adviser by an ex-convict who said he got it from sympathizers of Patty Hearst, the Washington Post said Thursday.

The adviser, Leo Cherne, reported the notebook missing after he returned from European meetings with diplomats and intelligence officers in March, 1975, the Post said.

The green government notebook was used by Cherne's aide, Cmdr. Lionel Olmer, a naval intelligence officer, to record briefings of Cherne's official meetings.

Involved in Hoax

Cherne is chairman of President Ford's foreign intelligence advisory board and a member of the new three-member intelligence oversight board.

Olmer said he has no idea how the notebook was lost or stolen, the Post said.

According to the newspaper account, the pad was recovered after Cherne received a call on July 24, 1975, from Michael Casey, a former inmate at Soledad prison near San Francisco, who said he got the notebook from sympathizers of Miss Hearst, the newspaper heiress convicted earlier this year of bank robbery.

Casey received notoriety in another connection with the Hearst case last year when the Los Angeles Times paid him $15,000 for a promised meeting with the heiress when she was still at large. The newspaper has since described Casey's offer as a hoax.

Petrodollar Information

The Post reported that Cherne notified intelligence officials as soon as he got Casey's call and was advised to play down the importance of the notebook.

The newspaper said the document contained sensitive information from briefings with the CIA, including reactions to news stories about the CIA and the flow of petrodollars from the West to Arab nations.

The Post reported that somewhere along the line the notebook was given higher priority by the CIA's office of security and the justice department started investigating how it was lost or stolen.

The newspaper said Cherne asked for the investigation.

Olmer said he still can't figure out how the document was misplaced.

MICHAEL JAMES CASEY, LEFT, CLAIMS TO HAVE RECOVERED BOOK
Leo Cherne, right, recorded secret data on trip to Europe in 1975

Top secret book 'found,' linked to Patty Hearst

WASHINGTON (UPI) — The Justice Department is investigating the temporary loss of a top secret notebook in which Leo Cherne, chairman of the President's Foreign Intelligence Advisory Board, had data recorded on a trip to Europe in 1975, the White House said yesterday.

Press Secretary Ron Nessen told reporters President Ford learned several months ago the "green book" containing intelligence briefing material had been missing for 14 months, then was reported "found" by a convict who said he got it from sympathizers of Patty Hearst.

"As I understand the whole matter is being reviewed by the Justice Department," Nessen said, adding the President was being kept "apprised" of the matter.

The notebook, described as carrying classified information "injurious to the national security of the United States," is a government note pad in which a staff aide to Cherne recorded briefings with diplomatic and intelligence officers during a trip to Europe in March of 1975.

Cherne is chairman of the President's board and a member of the new, three-member Intelligence Oversight Board.

The aide is Cmdr. Lionel H. Olmer, an intelligence officer with a 19-year Navy career, said to be a meticulous man used to handling top-secret material. According to a report in the Washington Post, Olmer could not find the notebook upon arriving at his home in Rockville, Md., and notified his superiors.

After a "14-month ordeal," Cherne received a phone call from Michael James Casey of Los Angeles, a convict who said "I have your notebook" and told him he recovered it from sympathizers of Miss Hearst, then at large.

Casey, who served two years at Soledad prison near San Francisco, said the finders of the notebook hoped it "might be exchanged for considerations," a deal which Cherne said he rejected.

Casey, 32, who was acquited Wednesday in Omaha, Neb., on a "felonious entry" charge, worked for a time for the International Rescue Committee, of which Cherne was chairman.

Green Book Affair'

Ford Adviser Central to Security Drama

By LAURENCE STERN
The Washington Post

WASHINGTON — Leo Cherne, one of President Ford's chief intelligence advisers, is a central figure in a Justice Department national security investigation being described by federal officials as "the green book affair."

The green book is a government note pad in which a staff aide to Cherne recorded briefings with diplomatic and intelligence officers during a trip to Europe in March of last year.

Cherne is chairman of the President's Foreign Intelligence Advisory Board and a member of the newly formed three-member Intelligence Oversight Board.

The notebook, officially described as having contained "classified information ...injurious to the ational security of the United States," disappeared immediately after Cherne and his aide, Cmdr. Lionel H. Olmer, returned from the European trip.

Olmer, an intelligence officer during his entire 19-year naval career, said he has no idea how the notebook got out of his possession. He is described by associates as an extremely meticulous professional experienced in the handling of classified material.

Within several hours after his arrival at his Rockville, Md., home he called Wheaton Byers, executive secretary of the Foreign Intelligence Advisory Board and told him of the notebook's disappearance, Olmer said. An investigation was conducted, and the notebook was presumed lost when the cabin of the aircraft used for the European trip was cleaned.

The mystery was solved, to the greater consternation of Cherne and Olmer, on July 24, 1975, when the intelligence adviser received a phone call from Michael James Casey of Los Angeles.

"He said, 'I have your notebook'," Cherne recounted Wednesday in describing what he called a "14-month ordeal."

It was during this and subsequent phone conversations that Cherne learned Casey had served two years at Soledad prison. Casey further explained that he had recovered the notebook from sympathizers with Patty Hearst, who was then at large.

Casey contended that the discoverers of the notebook had hoped that it "might be exchanged for considerations in their behalf, and I told him that I wouldn't do it even if I could," Cherne said.

Casey, in a telephone interview from Omaha, where he was acquitted Wednesday of a felonious-entry charge, insisted: "I was not trying to burn Cherne. I told him how I got the book and the interest of the people who had found it."

Casey is a 32-year-old Californian who prides himself on his work in resettlement of Vietnamese refugees, who sought to appear as a witness in behalf of Patty Hearst and who wound up, in an ironic turn of the story, working briefly for the International Rescue Committee, of which Cherne was chairman of the board.

Early last year Casey persuaded the Los Angeles Times to send him along with two staff reporters to Hong Kong at a reported cost of $15,000 for a promised rendezvous with Patty Hearst. The newspaper subsequently described the episode as a hoax. Casey acknowledged that the Hearst trip "bummed out."

Casey's career also encompassed a nine-month period as director of special projects for Boys Town, the community started by Father Flanagan, from which Casey was fired in a dispute with the administration over the alleged theft of 31 files for an MGM television production. ("One of my jobs," he said, "was to get them publicity.")

When Cherne found out who had turned up with his notebook, he notified the intelligence staff and was advised "to play it down and not make it appear to be important." The initial judgment was that the loss was not of great security significance.

Cherne maintained that he first learned that Casey was employed in the Los Angeles office of the International Rescue Committee as a consultant during an Aug. 22, 1975, phone conversation with Casey.

"I said, 'I don't think terribly much about your association with IRC and when I decide finally, I'll ask for your resignation'."

The green notebook was returned on Aug. 26, 1975, and Cherne turned it over to the intelligence staff. Three weeks later he called Casey and asked for his resignation. "He submitted cheerfully, always cheerfully," Cherne recalled.

On Sept. 22 Casey sent a mailgram to the presiding judge in the Patty Hearst case, Oliver J. Carter, in the name of the International Rescue Committee.

"We prayerfully request that Patricia Hearst be admitted to bail," the telegram said. "Please consider that Patty Hearst was directly and indirectly responsible for the safe evacuation of 390 men, women and children without regard to her own safety during the last week of April 1975 at Saigon, South Vietnam."

The telegram was immediately repudiated by the IRC on Cherne's instructions.

In February of this year Cherne was appointed to the Intelligence Oversight Board by President Ford and also was named chairman of the Foreign Intelligence Advisory Board, a position to which he commutes from New York on an average of twice a week. His offices here are in the Executive Office Building.

In March a reporter from the San Diego Evening Tribune, Robert Dietrich, called Cherne, explaining that Casey had showed Dietrich contents of the notebook.

The notebook, according to informed sources, contained notes on briefings with embassy and CIA officials about a varied number of issues, including reactions to news stories about the CIA, the impact of the massive flow of petrodollars from the West to the Arab states as well as "unprecedented unemployment and catastrophic inflation" in European countries.

There was an early reference in the notebook, both Cherne and Casey acknowledged, to New York Times reporter Terry Robards. Casey found Robards in New York, he said, and it was the Times reporter who speculated that the initials "L.C." in the book must have referred to Cherne.

This, Casey said, is how he concluded that the notebook belonged to Cherne.

Morris wins export job in Commerce Department

By LISA FRYE
Sun Reporter

Jacksonian William H. Morris Jr. has been nominated by President Ronald Reagan to be assistant secretary for trade development in the Commerce Department.

The post, which pays $52,750 a year, falls just below the office of Undersecretary Lionel Olmer in the Commerce Department hierarchy and deals primarily with export trade development, Morris said Sunday night from his residence in Arlington, Va., where he has been living since joining the Reagan national campaign last August.

If his appointment is confirmed by the Senate, Morris will be the second Tennessean named to the Commerce Department. He will join Bill Brock, former U.S. Senator from Tennessee and more recently chairman of the Republican National Committee, who is U.S. trade representative.

Morris said he will be working closely with Brock, a longtime ally, in the Commerce Department job. Morris was Brock's administrative assistant when Brock was a senator.

As assistant secretary of commerce, Morris' responsibilities would include the U.S. Commercial Service, comprising 47 field offices around the country set up to encourage exporting, and the Foreign Commercial Service, which includes the commercial attaches at U.S. embassies abroad.

He also would be responsible for the Bureau of East-West Trade, set up to encourage investment in and exporting to mainland China and "behind the Iron Curtain," he said.

Morris said both President Reagan and Commerce Department Secretary Malcolm Baldrige have said exporting will be a "top priority" in this administration. "We have to lower our balance-of-trade deficit."

The position is "an awesome responsibility," he said. "But I know it's something I'm going to enjoy doing."

Senate confirmation hearings haven't been scheduled, but they probably will be within the next three weeks, he said.

Morris formerly worked in export development in Tennessee as deputy commissioner of the Department of Economic and Community Development in Gov. Lamar Alexander's administration.

Morris resigned from that position last August to join the Reagan campaign team. The resignation came three months after a state audit of Morris' expenses that resulted in his repaying the state $378 in travel and telephone expenses.

Questions also were raised about a short-lived export lobbying firm Morris started in Washington, D.C., in late 1979. The audit said Morris could have used his state job to benefit the private firm, but stopped short of calling the enterprise a conflict of interest, noting that the firm had been disbanded.

When the Economic and Community Development budget officer who raised questions about Morris' expenses and business venture was fired last July, the budget officer charged the firing was political. E&CD Commissioner James Cotham, who strongly defended Morris through the audit, denied the firing was related to that incident.

After working in the Reagan campaign, Morris joined the president-elect's transition team in the Commerce Department. Since soon after Reagan's inauguration, he has worked at the department as a consultant.

New Mexico

Immigration Plans May Stir Debate at Border Parley

By JOE SMITH
Of the Journal's
Las Cruces Bureau

EL PASO — Gov. Bruce King is expected to discuss problems with President Reagan's proposed immigration policy when he meets with nine other executives in the Second International Border Governors Conference here Monday and Tuesday.

The New Mexico Border Commission, which met in Las Cruces last month, took a strong stand against Reagan's plan to give resident status to alien workers who can prove they were in the United States before 1980.

Under the plan, those aliens would be permitted to legally stay in the U.S. without voting rights, and would be given an opportunity to apply for permanent U.S. citizenship.

However, the alien's family would not be included under the president's proposal.

The state commission also voted against a guest-worker program, similar to the old Bracero program, that the president has proposed for a two-year trial.

But the commission voted to back Reagan's plan to beef up patrols along the border between the U.S. and Mexico.

A spokesman from King's office said those topics first would be discussed during private meetings with King's fellow U.S. and Mexican governors during the two-day meeting.

The second international meeting will begin at 2 p.m. Monday in the El Paso Civic Center following a closed buncheon of the 10 governors.

At 3 p.m., reports will be given by chairmen of committees on agriculture, cultural exchange, ecology and environment, energy and commerce, twin plants and industrial development and tourism.

Reports will be given by both the U.S. chairmen and their Mexican counterparts, and the report on agriculture will be delivered by Dr. William Stephens, New Mexico's secretary of agriculture.

Private sessions will open Tuesday's agenda, followed by panel discussions on transportation, investments and border crossing and ports of entry.

A second general session will close the conference, starting at 2 p.m. Tuesday.

All 10 governors have confirmed they will attend, said a spokesman from the office of Texas Gov. Bill Clements, who is host for the meeting.

At the First International Border Governors Conference last year in Juarez, Mexico, Gov. Edmund Brown Jr. of California was the only chief executive who failed to attend. He sent Tom Hayden, his chief assistant as his representative.

In addition to King, Clements and Brown, Gov. Bruce Babbitt of Arizona also will be at the El Paso meeting.

From Mexico, the governors who will be attending are Oscar Ornelas of Chihuahua, Emilio Martinez Manautau of Tamaulitas, Alfonso Martinez Dominguez of Nuevo Leon, Francisco Jose Madero of Coahuila, Samuel Ocana A. Garcia of Sonora and Roberto de la Madrid of Baja, California.

Clements said several federal officials, including Frank Crigler, director of the Office of Mexican Affairs of the Department of State, and Lionel Olmer, undersecretary of the International Trade Administration, will be at the conference.

Congressmen discuss Siberian gas line

By WILLIAM HINES
Chicago Sun-Times

WASHINGTON — A pipeline through Europe and Asia that could increase European dependence on the Soviet Union, but also could enrich U.S. firms came under brief congressional scrutiny last week.

The undertaking is a 4-to-7-year construction project to take natural gas from the Siberian Arctic to energy-hungry countries of western Europe. West Germany is expected to assume a major role in financing the $10 billion project.

At a hearing, Sen. Charles H. Percy (R-Ill.), chairman, spoke with concern about the "very real possibility that quite unwelcome political leverage could flow through the pipeline."

But looking at a brighter side, Percy noted that if the Yamal pipeline project goes ahead as planned, "the Caterpillar Tractor Co. and other American companies can and should share in whatever business is generated."

Caterpillar is the world's leading producer of very large, heavy-duty pipe layers. It recently got a license to export 100 such machines to the Soviet Union in a surprise move that the Japanese are said to be angry about. The Peoria (Ill.)-based company probably would sell hundreds more if U.S. businesses are permitted to take part in the project.

Percy also commented that if the United States pushes coal as an alternative to natural gas in Western Europe, mine operators will stand to profit — provided ports and railroads in this country can be upgraded to handle the increased traffic.

Percy's remarks came at the opening of a hearing that featured testimony by three sub-Cabinet officials from the departments of State, Energy and Commerce and brought Sen. John Glenn (D-Ohio), a possible 1984 presidential candidate, into conflict with the witnesses over the licensing of Caterpillar pipe-layers last month.

As Glenn recounted it, President Reagan persuaded Japanese Premier Zenko Suzuki at September's Ottawa summit meeting not to permit Japanese export of pipe-layers to the Soviet Union. Then, 10 days later and without notifying the Japanese, the Reagan administration issued Caterpillar's export license.

Assistant Secretary of State Robert L. Hormats and Under Secretary of Commerce Lionel H. Olmer both denied knowledge of what Reagan might have said to Suzuki, but Glenn insisted that the account must be correct because it was reported in the media and never refuted.

The administration officials said they were satisfied that the 100 pipe layers would not be used on the Yamal project, drawing from Glenn the retort that their existence in the Soviet Union would free other machinery for use on the northern pipeline.

The switch in signals, Glenn said, was typical of recent Reagan administration moves.

He cited as another example the assurances given to West Germany on the defense of the Persian Gulf oil region and the almost-simultaneous revelation by Defense Secretary Caspar W. Weinberger that a naval task force in the area would be reduced in strength.

Glenn also mentioned the on-again, off-again grain embargo in which, as he phrased it, "we put it on because they (the U.S.S.R.) went into Afghanistan and took it off because they didn't go into Poland."

The rest of the world, and particularly the Western allies, are getting "a lot of mixed signals," Glenn contended.

Hormats, Olmer and Deputy Energy Secretary W. Kenneth Davis spoke of the administration's intention to explore with the west Europeans "alternative sources of energy" (meaning, principally, coal) but did not rule out the likelihood that if the chips go down and the Yamal project is started, American firms will be allowed to participate.

Olmer said that only the U.S. has "actual, hands-on experience" in building pipelines under the vicious climatic conditions that prevail in the Far North. Denying this know-how to the Soviets could delay the Yamal project, but would not kill it, he added.

Archduke To Marry Princess Marie Astrid

By BARONESS GARNETT STACKELBERG
Special Correspondent

WASHINGTON — "**Archduke Charles Christian** of Hapsburg will marry **Princess Marie Astrid** of Luxembourg." That was the word from **Betty Lu Ourisman** at a fascinating dinner at the Portuguese Embassy last week. She and **Mandell Ourisman** had just returned from spending the weekend in London.

Ambassador Vasco Futscher-Pereira and his chic Brazilian wife **Maria Lucia**, a talented interior decorator, came to Washington last spring from his post at the U.N. The dinner was in honor of their deputy foreign minister, **Leonard Mathias** and his chief of cabinet **Fernando Neves**. It was a gourmet affair of mousse of sole, duck with baked pears, and a Grand Marnier Souffle. The Ambassador, who is a gourmet, supervised it himself.

Marion Javits, who knew the

Rosemarie Bogley
... beauteous guest

Futscher-Pereiras in New York City, flew down. She's still trying to rent her Watergate apartment. **Lawrence Eagleburger**, assistant secretary of state for Europe and his wife, the **Archibald Roosevelts, Mme Paul Henri**, wife of the French Ambassador to Lebanon, also came. She is the sister of **Peggy Donovan**, wife of **General Donovan**, our former military attache in Spain.

The formerly dreary embassy, which is next door to that of France, has achieved new distinction with the imagination of its chatelaine. Marvelous museum-worthy Buddhas — one life size — which they collected when en poste in Karachi, and striking modern paintings add to the more mundane furnishings. Several of the paintings were done by the Ambassador who, according to his counselor **Ribeiro de Menezes**, took up art at the late age of 57.

Since flowers are profuse in Palm Beach, hostesses might find it appealing to replace massive bouquets with Mme. Pereira's original simpler arrangements. Side tables here and there held 8 or 9 single smokey

Garnett Stackelberg

crystal vases, each holding a long branch of orchids, white lilacs, tiger lilies or anemones. The effect is especially attractive with a vigil light here and there.

To go back to **Princess Marie Astrid**, the future bride of the Archduke, she made many friends in Washington while studying at Johns Hopkins School of Advanced Studies. **Abigail McCarthy** was among them, and she occasionally dated Mississippi congressman **David Bowen**. The Princess is 27, tall and lovely with gold glinting brown hair and blue eyes. According to her friend **Ymelda Dixon**: "She was the last eligible Princess whose name was linked with that of Prince Charles, but because she was a Roman Catholic, nothing came of it." She is the daughter of the reigning **Grand Duke Jean of Luxembourg**.

Archduke Charles Christian, the groom to be, and his sister **Archduchess Alexandra of Hapsburg**, were in Washington last spring. They were houseguests of **Lillian Giberga**. While here they were widely entertained — one of the best parties being given by the aforementioned Mandell Ourismans.

Limousines of diplomats, officials and society snaked up the long driveway to the German Chancery last week. There in the vast ballroom German ambassador **Peter Hermes** and wife **Maria** received 200, all of whom were to sample imported German specialties arranged by the German Agricultural Marketing Board.

Chief of Protocol **Lee Annenberg** commented as she departed: "One of the most delectable spreads of food I have ever seen in my entire life, and I have seen some." An unbelievable feast of filet of beef with truffle sauce, fresh wild pheasant with wine sauce, ragout of veal and white and brown wieners with sweet mustard were on one table. And on another were platters of smoked salmon and eel, five feet across as well as every imaginable cold cut and excellent cheeses. Then there were raspberry desserts, apple strudel, marzipan and cookies, and excellent wines and beers as well as Asbach and pear brandy and Kirsch to wash everything down.

Earlier when Lee Annenberg was asked about her reported retirement she told the **Nicolas Salgos** and **Marshall Coyne**: "It is for the White House to make

Helen Boehm
... wedding bells?

any announcement. I love my job, but my husband comes first. We thought he would live in Washington, but business requires him to stay in Philadelphia except for weekends. He arrives tomorrow and we will talk it over."

Ken Crosby and stunning wife **Peggy**, sister of **Countess Romanones**, hosted a luncheon for **Thibaut de Saint Phalle** to launch his book "Trade, Inflation, and the Dollar." He ought to know about all that as he recently retired as one of five directors of the Export-Import Bank. He recently joined Crosby's new firm, Crosby International Group.

At the luncheon were **Paul Volcker**, chairman of the Federal Reserve Board, **Lionel Olmer**, under secretary of commerce for International Affairs, **Claire Boothe Luce, Wyatt Dickerson** and **Rosemarie Bogley**.

Heard that night that **Helen Boehm** soon will be on her way to the altar. And that **Ginnie Wilcox**, who is recovering splendidly from a double hip operation, will be coming with husband **Francis** and **Mrs. W.S. Gould** to take an apartment in Palm Beach in February.

Former State Rep Among the Notables Caught in Mortgage Fraud Ring

EDMUND H. MAHONY

Sep 26 2011

An 83-year old former state representative, who lost his law license years ago for misconduct, was sentenced to 5 years in prison Monday for handling closings for a group of conspirators who concocted phony real estate deals in order to swindle more than $4.4 million from banks.

Morris Olmer, a Democrat who represented New Haven in 1967 and '69 and a former member of New Haven's Board of Alderman, was convicted by a jury in April of conspiring to defraud the government, eight counts of fraud involving money transfers and four counts of making false statement to investigators.

Federal prosecutors said Olmer was one of a 14 conspirators who obtained $10 million in residential real estate loans through "sham sales contracts, false loan applications and fraudulent property appraisals." The conspirators are accused of dividing nearly half the money among themselves.

Olmer and three other members of the ring were convicted by a jury earlier this year. Seven others pleaded guilty to a variety of fraud-related charges, including the man prosecutors call **the leader of the ring, Syed Babar, 2**8, of New London. Babar agreed to cooperate with authorities and became the government's star witness.

The jury deadlocked on a verdict against a 14th alleged member, Rabbi David Avigdor, 57, who presides over New Haven's Congregation Bikur Cholim Sheveth. Avigdor, a lawyer, worked for worked for Olmer, who maintained a law office in New Haven after his license to practice was revoked following a fraud complaint about four years ago. Prosecutors have said they will retry Avigdor

Another conspirator, 68-year old Thomas Gallagher of West Haven - former grand marshal of the New Haven St. Patrick's Day parade and a member of the West Haven police commission - plead guilty to a charge of making a false statement midway through the trial. In return, prosecutors dropped more than a dozen other charges against him. He was given a five year sentence.

Gallagher was accused of manufacturing appraisals that inflated the value of the dilapidated homes the conspirators financed and transferred among themselves in distressed areas of New Haven, New London and other locations, mostly in eastern Connecticut.

Federal prosecutors said Babar arranged for straw buyers to finance and buy - at inflated prices - homes they had no intention of living in or paying for. When the deals closed, the conspirators split the loan amounts in excess of sale prices and walked away from about 30 properties, creating more blight in already struggling neighborhoods.

The conspirators created a paper contraction company called Sheda Telle Construction to launder money and justify home prices by with false claims of renovation work. Prosecutors said about $1 million in cash flowed into the company's bank account, without any work ever being done.

Prosecutors said the ring operated between 2006 and 2010.

Five conspirators. Including Olmer, have received prison sentences of from four to 7 1/2 years in prison, Syed and seven others await sentencing. Babar is scheduled to be sentenced in November 28.

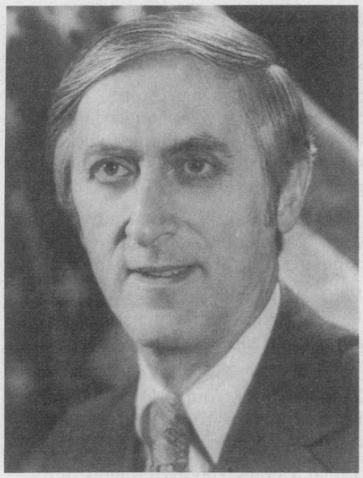
White House computer briefing reveals Commerce-Defense rift

Commerce Department efforts to foster trade in electronics are being thwarted by Defense Department hopes to halt technology and science leaks to Eastern Bloc countries. This opposition surfaced during a recent briefing held in the Executive Office Building for computer industry journalists.

Citing the country's technological expansion and the increasing trade imbalance, Lionel H. Olmer, Commerce Undersecretary for International Trade, spoke of electronics as a major trade commodity. High-tech electronics industries showed a greater growth rate and provided more new jobs than any other segment of the economy, he observed.

Although military purchases stimulated early electronic development, only three weapons systems now use technologies as sophisticated as the 64K RAM chip, according to Olmer. From this observation, he concluded that industry growth is the product of free market exchange and owes little to defense sources. America's economic interest are best served when markets for its technologies are available to producers, he added.

The Department of Commerce has sought to open overseas markets through multilateral trade agreements with Japan and Western European trading partners. However, a major obstacle to international trade in electronics has been the Department of Defense, which has adopted a policy of restricting the flow of technology to Eastern European countries, Olmer stated. (The DoD retains the right to review trade export licenses.)



Undersecretary of Commerce Lionel H. Olmer identified the DoD-Commerce trade impasse at White House press briefing.

Acknowledging the security requirement to maintain a military edge over Iron Curtain countries, Olmer noted that the DoD has identified over 200,000 control items, at least half of which have no strategic value. He also estimated that less than 10 percent of Soviet strategic intelligence comes from the back-engineering of technology in international trade. The remainder comes from espionage and the scientific data openly disseminated through science seminars and through provisions of the Freedom of Information Act—areas that *can* be controlled without restricting commerce.

Following Olmer to the rostrum, Assistant Defense Secretary Richard N. Perle defended DoD trade control. Admitting that back-engineering of items in international trade provided only limited strategic intelligence, Perle insisted that, in the interests of national security, all technology and science leaks should be plugged. He advocated greater controls on visas to identified Eastern Bloc scientists and agents and expressed the hope for more voluntary restraint on the part American researchers working in sensitive technologies.

Perle also indicated his intention to impose further restictions on trade with the East and to enlist the assistance of the customs service. He added that, over a year ago, he and Olmer had shaken hands on an informal agreement to extend DoD control on sensitive technology. According to Perle, Secretary of Commerce Malcolm Baldridge rejected the agreement in favor of extending international trade. In Perle's view, the goals of the two departments are clearly in opposition, and only the president can set the priorities to resolve the conflict.

During a luncheon talk to journalists at the Department of Commerce, Baldridge endorsed Olmer's view on the primacy of expanded international trade and expressed his own resentment of DoD contols of technological exchange. He added that the conflict with the DoD dates from over two years ago and that interdepartmental negotiations have led to a stalemate. The president is now aware of the impasse, Baldridge explained, and is expected to resolve the issue shortly.

President's Foreign Intelligence Advisory Board

President Eisenhower established a Board of Consultants on Foreign Intelligence Activities in 1956. It was created at the recommendation of the Hoover Commission on the Reorganization of the Government. Its purpose was to offer the president independent, objective, and expert advice on the effectiveness of the conduct of U.S. foreign intelligence. It was also created to head off an attempt by Senator Mike Mansfield to create a Joint Congressional Committee on Intelligence.14

Appointed to the board were prominent Americans who tried to per- form their part-time function in an unbiased, objective manner. Independent of the intelligence community and free from any day-to-day management or operational responsibilities, the board rendered its advice directly to President Eisenhower.When Kennedy was elected, Eisenhower did not discuss the im- portance of the board, and Kennedy considered eliminating it. But after the Bay of Pigs fiasco, Kennedy reconstituted the board and renamed it the Pres- ident's Foreign Intelligence Advisory Board (PFIAB). Kennedy later claimed that PFIAB was one of his most useful advisory boards.15

Over the years, PFIAB members met with leaders of intelligence agencies, examined reports, and visited intelligence installations to identify deficiencies in the collection, analysis, and reporting of intelligence. The board tried to eliminate unnecessary duplication and functional overlaps. Its recommendations influenced the composition and structure of the intelli- gence community, the development of major intelligence systems, and the degree of collection and analytic emphasis. In carrying out its mandate, board members had access to all the information related to foreign intelli- gence that they needed to fulfill their vital advisory role.16

When he was appointed to PFIAB, Cherne had no background in government service or foreign intelligence. His appointment was made at the urging of Casey, in return for Cherne's participation in Democrats for Nixon.Whatever the reason, Cherne was an excellent choice. In the fall of 1973, economic intelligence was not a high priority within the intelligence community. But the OctoberYom KippurWar in the Middle East, coupled with the shock in the United States over the Arab oil embargo, moved eco- nomic intelligence to the forefront of PFIAB's agenda. Few people in the the 1930s. Cherne was once again in the right place at the right time.

Cherne came onto the Board knowing some of its members. For years, he had known Edward Teller, the father of the H-bomb. In 1959, the IRC had given Teller the "William J. Donovan Memorial Award," which was Cherne's bronze bust of Donovan. Teller often offered Cherne advice. Cherne also knew Clare Boothe Luce, the former U.S. ambassador to Italy and congresswoman from Connecticut. Luce was the first woman appointed to PFIAB. Cherne and Luce had communicated during the 1940s and had co-authored three publications on Hungary. Other members of the board were new to him, for example, Nelson Rockefeller, who regarded his membership on the board as the single most important service he had ever performed for the U.S. government. Cherne and Rockefeller became close friends.18

Lionel Olmer, a U.S. Navy commander with a specialty in cryptology and Soviet naval communications, was the PFIAB staff member assigned to introduce Cherne to the work of the board. According to Olmer, Cherne was like "a kid in a candy store." Cherne wanted to know about everything, so Olmer made available to him dozens of secret studies on all manner of subjects, people, and places. Olmer communicated with Cherne daily, pass- ing on the latest news and offering suggestions for further study. Cherne soaked up the vast amount of information and still wanted more. He had a compulsion to know more than anyone else about every economic matter that came before PFIAB and possessed an insatiable curiosity about the more exotic aspects of the intelligence system.19

After several weeks, Olmer recommended that Cherne write up his findings as a way of drawing attention to the importance of economic in- telligence. For seven days Cherne dictated his report, which ended as a forty-page document. Olmer believed that the result was an artful, literate, but verbose critique of several intelligence agencies' programs. With some trepidation as to how Cherne would respond, Olmer told him that the re- port had great content, but that its style was off base considering its audi- ence: it lacked the appropriate "bureaucratese" essential for government reports. Much to Olmer's surprise, Cherne was open to frank criticism, al- though Cherne cringed when Olmer red-lined some of his favorite ex- pressions.They worked over the weekend, and in the end, Cherne mastered governmentese while losing nothing of what he believed was really impor- tant for the president of the United States to understand.

page 163 - 164

According to Olmer, Cherne's revised report was a huge success: it changed the future course of economic intelligence collection, analysis, and reporting. Equally important, it drew the attention of senior government policymakers to the enormous significance of economic intelligence and the array of resources that could be directed to answering their needs.20

Cherne's specific expertise was economic intelligence; but he par- ticipated actively in all PFIAB's activities. Throughout the late 1960s and early 1970s, the Soviet Union was building up its military forces. Several observers had begun to express dissatisfaction with the National Intelli- gence Estimates, particularly those related to the military power of the Soviet Union. PFIAB chairman, Admiral George W. Anderson, a retired four-star admiral and chief of naval operations at the time of the Cuban missile crisis, and PFIAB board member John S. Foster, a former deputy secretary of defense for development, research and engineering, sug- gested the development of an outside competitive analysis using the same information as that available to the CIA. President Nixon did not sup- port the recommendation, mainly because the director of the CIA, William Colby, opposed it. When Ford became president, Anderson re- stated his concerns and recommended that the competitive analysis be conducted through the National Security Council. Colby demurred. When George Bush took over from Colby, things changed. Bush was receptive to PFIAB's proposal.

PFIAB established "Team B" as an experiment in competitive analysis. The idea was to use nongovernment experts on the Soviet Union to second-guess the CIA's estimates of Soviet intentions and ca- pabilities. The PFIAB Board and staff involved were: Edward Teller, William Baker, Edwin Land, Robert Galvin (chairman of Motorola), Bill Casey, and Lionel Olmer. Many more private sector experts were re- cruited to this project, and they reported their findings to PFIAB.

The "Team B" conclusions projected a more powerful and dangerous Soviet threat than the intelligence establishment had reported to the presi- dent. Perhaps the most significant conclusion was that the accuracy and power of Soviet strategic missiles could potentially overwhelm U.S. missile forces and thereby negate the fundamental premise of America's nuclear de terrent: that enough would be left, even after a first-strike, to retaliate and destroy the Soviet Union.21

At this time, the nation as well as the intelligence community were in disarray. The Watergate scandal had engulfed the Nixon administration. Congressional investigations uncovered a variety of unsavory practices, up- setting many Americans, including Cherne. President Nixon resigned in his vice president Nelson Rockefeller, a member of PFIAB.

Coming on top of the Watergate scandals, the American defeat in Vietnam led to public cynicism and distrust of the government. Watergate also led to increased scrutiny of the American intelligence community, which was tangentially connected through Nixon's effort to blame the CIA to cover his misdeeds. Most Congressmen were unfamiliar with the Amer- ican intelligence operations. Like all large bureaucracies, the intelligence community had made its share of mistakes; though unlike other large bu- reaucracies, the intelligence community's mistakes had been hidden. When Congressional committees examined and critiqued intelligence practices, mistakes were exposed. Senator Frank Church's committee focused on in- telligence abuses. Otis Pike's House Select Committee on Intelligence ex- amined and reported on intelligence failure in the Middle East. President Ford attempted to head off these investigations by creating a blue-ribbon commission chaired byVice President Nelson Rockefeller. One member of the Rockefeller Commission was the ex-Governor of California, Ronald Reagan.22

Shortly after Gerald Ford became president, several White House staff members solicited Cherne's advice. During this difficult period for the intel- ligence community, President Ford appointed Cherne chairman of PFIAB. At the time, Cherne was a registered Democrat, and he asked why he had been appointed chair. Ford's response was: "I worked with you and watched you for some time, and I reached the conclusion that you would be the one most likely to tell me what I might not wish to hear."23As chairman, Cherne con- tinued to meet with the White House aides concerned with intelligence, and he met several times with the president. Through these meetings, Cherne shaped the board agenda. PFIAB met on the first Thursday and Friday of every other month, with ad hoc committee meetings as required. Intelligence agency leaders, Cabinet officers, and others were invited to attend as necessary.

On the same day that Cherne became chairman of PFIAB, President Ford expanded the board from ten members to seventeen. PFIAB increased in importance when, as a result of the Rockefeller Commission report, it was given responsibility for policing the intelligence community.24 Most PFIAB members contributed actively during meetings and offered advice outside of meetings as their schedules permitted. Cherne saw PFIAB as his primaryjob. He estimated that he worked the equivalent of 94 days on PFIAB business during the first half of 1976.25

By all accounts, Cherne was an excellent chairman. He possessed great skill in running the meetings of this board composed of individuals of great distinction. Cherne skillfully organized presentations of complicated and diverse material outside his own area of expertise, then involved mem- bers and staff in their areas of expertise or responsibility. Cherne did not himself pontificate, but led the meeting to ensure that PFIAB's busy agenda was met. He had the ability to listen and comment without hurting feelings or egos. Edward Bennett Williams, one of the top lawyers in Washington, said at the end of the first one-and-a-half day meeting Cherne chaired: "That's the best meeting I've ever been to in my life."26

Although the "Team B" work had been launched by the previous PFIAB chairman, Admiral George W. Anderson, its work became public during the time that Cherne chaired the board. This publicity upset the new director of the Central Intelligence Agency, George Bush.27 Subse- quently the concept of a competitive analysis was discontinued. However, the "Team B" concept reemerged in 1986, when SenatorJesse Helms raised the issue in the Senate for a competitive analysis focused upon the Soviet Union. Helms's views were adopted by a Senate resolution, but PFIAB did not conduct further competitive analyses.28

In the days before George Bush left the position of director of the Central Intelligence Agency, he wrote to Cherne reporting that the year 1976 had been a good one for the U.S. foreign intelligence community.The CIA and other intelligence agencies introduced innovations and restored confidence in the integrity of their foreign intelligence function. Bush be- lieved that PFIAB under Cherne's leadership had contributed significantly to these changes. Handwritten at the bottom of Bush's note to Cherne was, "I hope our paths cross in the future."29

Chapter 11 : The Falling Curtain

In addition to being a humanitarian, Leo has been an economist, political scientist, sculptor, and advisor to presidents for over 40 years. His extra- ordinary service to his country and to mankind are inspiring and deserv- ing of recognition from his fellow citizens. . . . Although he has never held elected office, Leo Cherne has had more influence on governmental pol- icy than many members in Congress. Since the late 1930s, Leo Cherne has stepped forward and with brilliance, energy, and moral passion to help this nation overcome countless challenges.

—Citation for the Presidential Medal of Freedom, given to Leo Cherne by President Ronald Reagan, 1984

Throughout most of his adult life, Cherne worked full-time at the Research Institute of America. The Institute was a privately owned corporation, with Carl Hovgard the majority stockholder, and Cherne plus another employee minority stockholders. In 1964, the owners sold the Institute to the Lawyers Cooperative Publishing Company in Buf- falo. Cherne became vice chairman of the Lawyers Cooperative Board of Directors, and the following year, chairman.1This role permitted Cherne's active participation in the International Rescue Committee, Freedom House, and the President's Foreign Intelligence Advisory Board, with a bit of time left over for his other interests.The Lawyers Cooperative eventually sold the Research Institute to Thompson International. Cherne's relation- ship with the Institute ended in 1990, after 54 years of service.2

Awarding Medals

By the early 1980s, Cherne's life had reached a peak. His office walls had for decades been covered with awards and photographs testifying to his extraor- dinary achievements.They included many decorations from foreign govern- ments. Friends and colleagues thought Cherne deserved public recognition from the United States—specifically, that he should be awarded the Presi- dential Medal of Freedom.

President Truman had initiated the Medal of Freedom, which was awarded for meritorious war-connected acts or services. General Lucius Clay had first proposed this distinction for Cherne to President Eisenhower, citing Cherne's postwar work in Europe, Japan, and Hungary. Clay's proposal did not succeed, but sporadic attempts were made to place Cherne's name in nomina tion. President Kennedy replaced Truman's award with the Presidential Medal of Freedom, the nation's highest civilian honor given in the United States. It was awarded for meritorious contributions to security or national interest, world peace, or cultural or other significant public or private endeavors.3

When Ronald Reagan was elected president, renewed efforts were made to obtain the Medal of Freedom for Cherne, but the campaign was blocked by Michael K. Deaver, Reagan's Deputy Chief of Staff in theWhite House, who believed the award should go to individuals who had greater visibility and public recognition than did Cherne.4 Then fate intervened. Fred Demech, a naval lieutenant commander who was assigned to the White House and who had known Cherne when he was appointed to PFIAB, was asked to write President Reagan's speech for the IRC's fiftieth anniversary celebration, scheduled for November 15, 1983. Demech wrote into Rea- gan's speech the following announcement: Cherne's "extraordinary service to his country and to mankind are inspiring and deserving of recognition from his fellow citizens. It is with great pleasure that I announce tonight that I am awarding the Presidential Medal of Freedom, our nation's highest civil- ian award, to Leo Cherne. Congratulations, Leo, on a well-deserved honor." Unable to attend the ceremony, Reagan videotaped his speech, which had been cleared by his staff. It was played for an enthusiastic audience at the IRC's fiftieth anniversary ceremony at the Waldorf in NewYork.When the list of recipients for the Presidential Medal of Freedom was drawn up in February 1984, Demech made sure that Cherne's name was on the list. Deaver again objected. Demech pointed out that President Reagan had al- ready announced that Cherne would receive the award. Deaver was furious with Demech, but could do nothing.5 On March 26, 1984, President Rea- gan delightedly conferred upon Cherne the Medal of Freedom in the White House; some of the others who received the same honor on that day were Reverend NormanVincent Peale, Louis L'Amour, and James Cagney.

Predicting the Future

Before the concept of "futurist" was born, Cherne was one. For over fifty years he publicly projected what would happen—economically, politically, and socially—during the upcoming year. His first speech to forecast the future was given at the Sales Executive Club of NewYork in 1940.The club had been started by ThomasWatson, Sr., the founder of IBM, in 1932.Wat- son required all his top sales executives to belong. His idea, at the height of the Depression, was to get the economy rolling again by starting a selling crusade. The club focused on improving salesmen's methods and morale. The club published newsletters, held seminars, and invited big-name speak- ers for its events. Over the years five presidents, Wendell Willkie, Henry Ford II, Bob Hope, Eddie Cantor, Alan King, NormanVincent Peale, and Ann Landers addressed the club.6

Cherne was one of the club's speakers in January 1940. His talk was such a success that the club invited him back.This continued annually for the next fifty years. His speeches were often given in the grand ballroom at the Waldorf-Astoria, which would be packed with thousands of executives. Cherne used these occasions to predict what was going to happen during the upcoming year. His presentations started with his predictions of the previous year, which he graded for accuracy. He usually gave himself a grade of 90 percent or higher and few participants disagreed with his self-assessment. Then he proceeded into what he projected for the upcoming year. His speeches were widely attended by a broad segment of America's political and business leaders.7 In addition, newspaper and magazine reporters often covered his predictions.

Cherne's fiftieth "Consecutive and Final First-of-the-Year Forecast Luncheon Program" was titled: "Millennium: A Reach into the Future," and was attended by more than 2,000 executives in the ballroom at the Wal- dorf. The program co-chairs included Alan Greenspan, Henry A. Kissinger, Happy Rockefeller, and Liv Ullmann. Malcolm Forbes, Jr., and Nelson A. Rockefeller, Jr., gave special introductions.8 Kissinger uttered admiring ac- colades: "What courage it has taken each year for fifty years to polish your crystal ball before a roomful of the country's brightest and best-informed leaders. Surely the entire world pauses early each January to learn from you what is expected of it!"9

Retiring Chairman

Cherne prodded the IRC to seize new opportunities for assisting refugees. He advocated for new programs during the 1980s and early 1990s. For in- stance, he encouraged the IRC to become involved in Africa; after pro- grams were launched, he traveled to inspect them.

Cherne was also deeply worried by the plight of the Afghan refugees. Tens of thousands had fled the country when the Soviet invaded Afghanistan in 1979, Throughout the 1980s, more refugees poured into Pakistan. During the Cold War, the United States supported the refugees and those groups who opposed the Soviet forces in Afghanistan. When the Soviet Union agreed to withdraw its forces from Afghanistan ten years later, about 3.5 mil- lion Afghan refugees lived in Pakistan. With Soviet forces no longer in Afghanistan, Cherne was worried that the United States would give signifi- cantly reduced attention to their refugees in Pakistan.The U.N. High Com- missioner for Refugees (UNHCR) at the time, Saddrudin Aga Khan, issued statements to this effect, urging

continued attention to the refugee situation.

During an IRC Board trip to Pakistan led by Olmer, which included meetings with the president of Pakistan and with the UNHCR, these mat- ters were discussed. On return to the United States, Cherne urged that a Citizens Commission be created to sustain a worldwide focus on the Afghan refugees, notwithstanding the apparent end of military conflict. As a result of the commission's work, the IRC was the first foreign operation to assist Afghan refugees.

The IRC's Citizens Commission had unintended positive conse- quences for the IRC. While trying to select commissioners, Olmer met Sadako Ogata, then the director of the Institute of International Relations at Sophia University in Tokyo. She previously represented Japan on the United Nations Commission on Human Rights, and in 1990 was selected as the independent expert of the United Nations Commission on Human Rights on the human rights situation in Myanmar. She declined Olmer's invitation to join the commission when the General Assembly elected her to the position of United Nations High Commissioner for Refugees. How- ever, she worked closely with the IRC for the following ten years on many refugee matters including those connected withYugoslavia. In 2001, after her retirement as UNHCR, she became an IRC board member.

By 1990, IRC programs operated on five continents and was the largest nonsectarian, nongovernmental refugee operation in the world. Much of IRC's success can be attributed to Cherne's work. It was notjust his promotional activities or his fundraising prowess. This phenomenal suc- cess derived from the board and staff he recruited, encouraged, and men tored. John Whitehead, who Cherne brought on to the IRC's board after the Hungarian uprising in 1956, had risen to the top of the investment banking profession and then served as deputy secretary of state. He was the obvious choice to succeed Cherne when the infirmities of age made him realize in 1991 that it was time to step down.

Tributes flowed in from Presidents Nixon, Ford, Carter, Reagan, and Bush and from many others. In his tribute to Cherne, Henry Kissinger remarked that it had always "meant a great deal to me to know there was a Leo Cherne in this world, always ready with advice, always ready to give his time and his compassion in difficult circumstances." He continued: "Any- body can project the familiar into the future. But the greatest role of a leader is to take a people from where they are to where they have never been.That is ajourney that requires faith and dedication and we honor Leo Cherne, above all, for the faith and dedication he has always shown in our journey towards a world in which the just can be free and the weak, se- cure."10 Characteristically, it didn't occur to Cherne, in his new role as chairman emeritus, to stop working. Flashes of the old eloquence, the old brilliance, the old fire, still continued to inspire, move, and persuade his board, staff, and colleagues.

Emerging Refugee Emergencies

Throughout most of its history, the IRC has had limited private funds, and has been forced to rely heavily on U.S. government funds and those of the U.N. High Commissioner for Refugees. In refugee emergencies, some- times hours and days were lost while funding was sought.Yet refugee emer- gencies required quick and effective responses. Mobilizing at the first sign of a serious refugee problem saves lives and enhances the ability of the refugees to survive in the long term. Failure to take quick and effective action in such crises often results in social turmoil and political instability within the country to which refugees have fled, and sometimes the strife spreads to neighboring countries, exacerbating unstable and chaotic situations.

When Yugoslavia imploded in 1991, the IRC was one of the first agencies to respond; quickly it was heavily committed, assisting tens of thousands of Bosnian, Serbian, and Croatian refugees, who struggled for survival in the heart of Europe. Hence, when Kurds fled into northern Iraq after the GulfWar, the IRC had no reserves to assist the refugees who were fleeing Iraqi military forces. Still, the IRC sent a team to help and was the first voluntary organization to arrive to help these refugees.

IRC Board members Lionel Olmer and Jim Strickler went to Turkey and northern Iraq to review the IRC's efforts. The person running IRC's program was doing wonderful work alongside the U.S. and other NATO military forces that were engaged for almost the first time in a major human- itarian effort. The trouble with the IRC's effort was that it lacked money, communications equipment, shovels, and supplies. Eventually, the IRC was able to provide shelter and bring medical, public health, and sanitation specialists into the situation, professionals drown from the IRC's worldwide pool of refugee emergency experts and volunteers. But the time lost early in the crisis meant that many Kurds died or became ill due to exposure and the lack of water, food, and proper sanitation.11

While in Turkey, Olmer phoned Cherne, who was delighted with the on-the-spot report and was only saddened by the fact that he could not be there with them. On the return trip, Olmer and Strickler discussed what the IRC could do in the future to be better prepared for emergencies. Olmer suggested that the IRC pre-position kits of supplies for future emer- gencies. This led to the thought that U.S. companies might be cajoled into donating an emergency radio system to the IRC.While this would be use- ful, better still, they concluded, would be an emergency rescue fund that could meet whatever the next critical situation required.12

Upon his return to the United States, Olmer asked Cherne if he would mount a major effort to help deliver the IRC from its dependence on governmental funding sources by putting together a fund to be used only in emergencies. Cherne approved the concept, as did the IRC board. Cherne agreed to begin contacting individuals in hopes of establishing a $1 million fund—which everyone thought was very ambitious.13

With a $1 million corpus, the emergency fund was expected to gen- erate an annual income of $50,000, enabling the IRC to take immediate action in one or two emergency situations should they arise. Decisions to draw on the fund were to be made by the IRC Executive Committee, which must declare that a refugee emergency had arisen.The fund's princi- pal could be invaded only by a decision of the IRC board, and only when the severity of the emergency required such action.The principal would be then replenished as expeditiously as possible following any withdrawal.14

Cherne was delighted to help raise money for the fund, which was named in his honor, "The Leo Cherne Emergency Refugee Fund." The IRC board and staff worked out the details. Cherne approached Peter Drucker, who agreed to chair the fund. Drucker had worked as a volunteer with the International Relief Association during the late 1930s. Drucker had worked at the Research Institute as a consulting editor to their associate member's program from 1950 to 1953.15 Drucker and Cherne had stayed in touch and Cherne had involved Drucker in IRC activities. Much to every- one's surprise, the fund exceeded $1 million within six months and doubled again a few years later.16This was the crucial first step toward financial stabil- ity as well as an assured capability for rapid and effective response to refugee emergencies.When refugees fled Kosovo a few months after Cherne's death, the Leo Cherne Emergency Fund helped them survive.

Dying and Remembering

Although Cherne was active in many Jewish groups, he was not an observant Jew. Cherne had not had a Bar Mitzvah ceremony. He was not a Zionist, much to the chagrin of some of his Jewish friends. Yet, Cherne reflected the best values and traditions of Judaism in his forceful and successful public life. Said Lionel Olmer: "Although he was not a religious man in a conventional sense, as he came closer to the end of his life, he seemed more drawn to the meaning of his Jewish heritage and its traditions."[17]

Following in his parents' footsteps, Cherne rarely was seen in a synagogue, but he always considered himself a Jew. He celebrated Jewish holidays, and he particularly enjoyed Passover, which marks the deliverance of Jews from Egypt and slavery. Passover celebrated freedom. According to his friend Henry Denker, Cherne "always took special pleasure in that part of the service where it is recalled the various works by which God brought forth the Jews out of slavery, inflicting the plagues to force Pharaoh to let the Jews go free, sparing the first-born of each Jewish family, parting the Red Sea, providing manna to sustain the Jews in the desert, bringing the Jews to Mount Sinai, giving us the Ten Commandments, and finally bringing us to the Holy Land."[18]

Cherne died at 9:30 A.M. on January 12, 1999. He had chosen to be buried in a Jewish cemetery on the easternmost reaches of Long Island. As prescribed by Jewish tradition, Cherne was buried the day following his death. The service had been scheduled for 11:00 A.M. but it had to be delayed due to the bad weather. The service began at 11:30 and lasted about half an hour. "The Rabbi's sermon was brief and crisp, but it captured Cherne's commitment to the cause of freedom in behalf of refugees," reported Olmer.[19]

The burial site was in a brand new cemetery a forty-five-minute drive from the temple. His grave site was located on a small hill difficult to climb due to the ice on the ground and the bitter cold wind. Cherne's casket was draped with an American flag in honor of his many years of service to the U.S. government. An honor guard folded the flag and presented it to his daughter. The few words required for the dead under Jewish law were spoken by the Rabbi, and Cherne's body was lowered into the grave wrapped in a shroud enclosed in a plain pine box. According to custom, each of the mourners threw a handful of dirt into the grave onto the casket.[20]

Henry A. Kissinger, Liv Ullmann, Henry Denker, and many other prominent Americans. Many more wanted to attend, but the space in the hall was limited.

To John Richardson, who had known Cherne since the Hungarian Revolution in 1956, Cherne epitomized the American dream. Cherne possessed "extraordinary skills as a team builder, organizational leader, public speaker, public relations expert, and sculptor." As important, Richardson revered him for his "unlimited commitment to the causes he believed in," admired him "for his penetrating political analysis," and "loved him for his capacity for unlimited friendship, can-do spirit, human foibles, boyish enthusiasms, unvarnished patriotism, devotion to freedom, and for his warmth and charm."[21]

Lionel Olmer, Cherne's friend since 1973, recalled that Cherne "was the soul of the IRC. He gave it a philosophy and mission, a raison d'etre, rather than analytically sound business objectives, and this motivated its volunteers to an extraordinary degree. The people he was attracted to and who were attracted to him knew that he stood for 'values' such as freedom and dignity more than anything else, and they, particularly the youngsters, held him in awe. Leo was not one to be locked into formal job descriptions and annual performance reviews. He knew—and they knew—what was expected, and most would do anything to earn his praise. Leo was admired around the world for what he had done with his life and what he had done for others." For Olmer, "Leo was an inspirational leader, who knew what was right and did it, and whose personality and image made others follow him, convinced of their humanitarian purposes and of the transcendent value of what they were doing."[22]

Elie Wiesel said in his tribute that Cherne "gave homes to the homeless and hopes to the hopeless." Senator Daniel Patrick Moynihan concluded in the *Congressional Record*, "I think it is safe to say Leo Cherne's life helped to redeem the 20th century."[23]

[HN000Q][GDrive]

He likes to tinker - with the ancient, luminous, fire-engine-red Austin-Healy in his garage or with the odd chair made out of driftwood or with the lamp made out of a wine bottle in the den.

But at the Commerce Department, where he is Under Secretary for International Trade Administration, Lionel Herbert Olmer does not have such a free hand. As the point man in the disputes with Europe over steel and the Soviet gas pipeline and in the quarrels with Japan over general trade policy, the 47-year-old Mr. Olmer has to balance competing interests in one of the toughest jobs in Washington.

Making the balancing act all the more difficult is the keen interest that trade issues have generated in the other major departments such as State and Defense, with their own special constituencies, and the constant pressure applied by these departments in shaping final policy.

Many Trips Across Pacific

Europe has not been Mr. Olmer's main area of expertise. As director for international programs at Motorola Inc. before joining the Reagan Administration, he led one of the rare successful forays by an American electronics company into the Japanese market, and he was brought in by the Administration to talk tough to Tokyo.

Tough talk has marked frequent negotiating trips across the Pacific in his effort to get Japan to buy more goods from the United States and thus reduce the American deficit in trade with Japan.

But, even after Japan adopted a series of market liberalization packages, the trade gap has widened. Last year Americans bought $18.1 billion more goods from the Japanese than it sold to them. This year the deficit will be more than $20 billion.

"The growing size of that deficit doesn't bespeak success for our policies," commented one Olmer critic in another agency. 'As Tough As They Come'

A European official who has been one of Mr. Olmer's adversaries commented: "He strikes me as extremely courteous but also somebody who, when it comes down to brass tacks, is as tough as they come. He has a reputation among my colleagues of being anti-European. But that doesn't bother me much because he knows his dossier and is fair." The European official asked not to be identified.

"In light of all the circumstances, Mr. Olmer has done a reasonably good job," said Stanley J. Marcuss, who held a roughly equivalent position in the Carter Administration. "He has been remarkably even-handed," added Mr. Marcuss, now a partner at the Washington law firm of Milbank, Tweed, Hadley & McCloy.

On the pipeline issue, Mr. Olmer has been a moderating influences within the Reagan Administration. He has opposed officials at the Defense Department and the National Security Council who believe the Soviet Union can be forced to change policy objectives through economic pressure.

And Mr. Olmer joined his boss, Commerce Secretary Malcolm Baldrige, along with Treasury Secretary Donald T. Regan and Secretary of State George P. Shultz, in urging President Reagan to relax his sanctions against European companies that violate the embargo on shipments of American-produced or American-designed equipment for the 3,700-mile pipeline that will link the gas fields of Siberia and Western Europe.

In the trade dispute over shipments of European steel to this country, Mr. Olmer labored in the background to carpenter an import quota arrangement, only to have it rejected by the American steel industry. But talks between the Commerce Department and the Europeans will get under way again next week, raising hopes that perhaps some modified version can form the basis of an agreement. Workmanlike Approach Noted

"He's a very pragmatic and sensible fellow," said Thomas L. Farmer, who as director of President Carter's Intelligence Oversight Board retained Mr. Olmer as its principal consultant. "He's a workmanlike, reliable guy, definitely not ideological."

Mr. Olmer served five years in the Nixon and Ford Administrations on the President's Foreign Intelligence Advisory Board, finally becoming staff director. The board, established by President Dwight D. Eisenhower in 1956, consisted of private citizens who offered advice on the adequacy of this country's foreign intelligence.

Mr. Olmer was born in New Haven on Nov. 11, 1934. After earning a bachelor's degree from the University of Connecticut and a law degree from American University in Washington, he specialized in trade law. He also was an officer in the Navy, rising to captain. One of his assignments was with the staff of the Chief of Naval Operations during the late 1960's.

He is married to the former Judith Sayler of Portland, Ore., a military analyst at the Central Intelligence Agency. They have two children.

Besides tinkering at home, Mr. Olmer likes to jog. Sometimes he wears a T-shirt emblazoned "U.S. Exports Mean Jobs."

STATEMENT OF LIONEL H. OLMER, UNDER SECRETARY FOR INTERNATIONAL 'fRADEDESIGNATE, U.S. DEPARTMENT OF CoMMERCE

Mr. Chairman, Senators, I am deeply honored to appear before you today to solicit your confirmation of me as President Reagan's selection to be Under Secretary of Commerce for International Trade.

Having read the legislative history associated with the establishment of this position; having worked with people in and out of government during the time the reorganization plan which created the post was being written; and having had numerous occasions in the past four years to call upon the Department of Commerce for assistance, I am properly respectful of the enormity of the tasks which lie ahead if I am confirmed by the Senate for this job.

You have been provided with my detailed biography and so I propose to simply outline my recent experience which I believe contributes most directly to my qualifications for this assignment.

From 1977 until two month ago, I worked for Motorola Inc., a leading U.S. manufacturer and exporter of communications and electronic equipment. My responsibilities as Director of International Programs involved the development and implementation of trading opportunities primarily with Japan, and to a subordinate degree in West Africa and Latin America. This involved frequent travel and discussions with U.S. Foreign and Commercial Service, and foreign government as well as private sector representatives. I also participated in the process of advising U.S. Government officials relative to the Multilateral Trade Negotiations and provided legal advice relative to industry efforts to seek relief from injury due to imports. I analyzed and wrote for the corporate leadership my assessments of business opportunities vs. risks in many countries of the world and was privileged to lead the Company's efforts over a 2-year period to penetrate the Japanese public telecommunications market-to the best of my knowledge the first major such achievement by a non.Japanese company.

I believe that these experiences in the immediate past four years, coupled with the dedication to hard work that I know has been part of my entire professional life, will make it possible for me to advance the objectives of the International Trade Administration.

The data is well known and I believe argues persuasively for a concerted U.S. Government supported major effort to do a better job at exporting U.S. goods and services and to watch carefully lest our open market system, which is so attractive and indeed essential to our competitors, be abused. Starkly put, many of our industries have become less competitive relative to some of our significant trading partners. By "competitive" I mean price, technological uniqueness, service, quality, marketing ag□essiveness and terms of finance.

Most especially, by way of contrast, in Japan there is a clear recognition that control of major, future world markets will be heavily dependent on supremacy in high technology and as a consequence there has developed a consensus, a "comity" if you will, between government, business, labor and academia that a program be implemented to assure preeminence within the next decade in the knowledge intensive sectors.

The President's entire economic program is directed towards increasing investment and accordingly, our competitiveness. Implementation of this program will go far to improve our trade performance. But there are barriers to exporting even highly competitive goods, and unfair trade practices can threaten even competitive U.S. industries.

If confirmed, my program for ITA would involve five major areas.

1. Vigorous implementation of the various codes under the multilateral treaty negotiations which, I believe, represent a commitment by the government to the private sector.

2. Creative promotion of exports, especially greater efforts to involve small and medium size businesses in these opportunities.

3. Careful monitoring of imports relative to enforcement of our trade laws.

4. Identification of industrial sectors of critical importance whose real or threatened decline should spark imaginative counter efforts by business working in concert with the government.

Effective management of export control policy.

The fifth program area, that of proper administration of our export control system, will not in the short run contribute to improving our trade imbalance but it is essential for our national security, on which all else ultimately depends, and I would intend to pursue this with equivalent vigor.

I welcome your questions

BIOGRAPHY OF LIONEL H. OLMER, NOMINEE FOR UNDER SECRETARY FOR INTERNA

TIONAL TRADE, INTERNATIONAL TRADE ADMINISTRATION, U.S. DEPARTMENT OF CoMMERCE

Lionel H. Olmer was nominated by President Reagan as Under Secretary of Commerce for International Trade on February 12, 1981.

From 1977 until his nomination, Olmer was Director of International Programs for Motorola, Incorporated. At Motorola he was responsible for development and implementaion of international trade strategies; he devoted particular attention to the trade opportunities created by the Multilateral Trade Negotiation Agreements. Partly as a result of his efforts, Motorola has become the first major U.S. high technology manufacturer to penetrate the highly competitive Japanese public telecommunications market. In Africa, Olmer assisted Motorola to succeed in markets long domihated by French telephone equipment manufacturers.

Before joining Motorola, Olmer served for nearly five years on the President's Foreign Intelligence Advisory Board, ultimately as staff director. The Board, estab lished by President Eisenhower in 1956, consisted of private citizens who advised the President on the adequacy of U.S. foreign intelligence, including economic intelligence.

Olmer holds a bachelor's degree from the University of Connecticut and a law degree from the American University in Washington, D.C. He is a member of the Connecticut and District of Columbia bars.

Olmer served as an officer in the U.S. Navy in assignments which included the staff of the Chief of Naval Operations during the late 1960's. He is a graduate of the National Defense University. Olmer is a member of the Board of Directors of the International Rescue Committee and Chairman of its Washington Advisory Group. The IRC is a voluntary agency whose purpose is to aid in the relief and resettlement of refugees.

A native of Connecticut, Olmer and his wife, the former Judith Sayler of Portland, Oregon, live in Rockville, Maryland, with their two children.

U.S. DEPARTMENT OF CoMMERCE,

THE UNDER SECRETARY FOR INTERNATIONAL TRADE

1967-1968

Da Nang Air Base Under Attacked

By 1967, the BIG LOOK operations tempo was well established.

At least one Big Bird mission (EC-121) flew daily, supplemented by Whales (EA-3B), and/or a second Big Bird as needed. By March 1967, 54 enlisted personnel were assigned on TAD from NCSP, over half of which were designated crew. Additional personnel were TAD from Kamiseya. Living conditions were improving as well, with new barracks and other facilities under construction. Government messing became available effective 25 May 1967, and somewhere about that time NCSP Det Bravo was inaugurated, with LCDR Donald R. Larson as Officer-in-Charge. However, much of this "forward movement" came to an abrupt halt the night of July 15.

"Shortly after midnight on 15 July, the Da Nang Air Base was struck by enemy rockets. Eight military personnel were killed during the attack and 155 others were wounded. The enemy barrage, which lasted approximately 45 minutes, started numerous fires and resulted in extensive structural damage to U.S. Navy, Marine and Air Force facilities. In addition, eight aircraft were destroyed and 45 were damaged during the attack." (NAVFOR Command History, July 1967, p. 45)

Note: the featured Image is a photo of the attack.

Major Casualties, but None Were CT Spooks

This rocket attack was the most extreme experienced during life of the detachment. Out of a total of 163 casualties, 44 were VQ-1 and NSG Det Bravo personnel, but none were spooks. Luckily no one was killed, but all three VQ-1/NSG Detachment barracks were destroyed. This was not due to a direct hit on the barracks, but rather to a hit on a nearby ammo dump. The dump exploded and rained shrapnel down onto recently constructed bunkers, which at the time, did not have roofs. Additional damage/injuries were caused by the shock waves of the exploding ammo. The fires from this attack were so intense that former BLS CTR2 Gary Hughes, then stationed 40 some miles away at Phu Bai, could see the glow on the horizon. Most of the detachment was evacuated from Da Nang, with only a skeleton crew remaining behind. When they returned, det personnel were temporarily billeted at Camp Tien Sha, located at the base of Monkey Mountain, east of the base, until new barracks could be built. In addition to the destruction of the barracks, all the aircraft were damaged to some extent, and VQ-2 had to temporarily supply EC-121M aircraft from Rota, Spain, so that operations could continue. Two people enroute to the det from the Philippines, Sgt G.R. Wright, USMC and CTRSN Lowell "Wilkie" Wilks, were at Clark Air Base waiting for a flight when they were told their orders were on hold. They finally arrived in Da Nang two weeks later.

In the fall of 1967, LT(jg) Ike Cole joined the detachment as an evaluator, TAD from San Miguel for several months. Ike remembers flying a lot, almost every day, and the highly-skilled enlisted operators.

The Tet Offensive

January 30, 1968, marked the start of the Tet offensive by the North Vietnamese. LCDR Carl Strobel, Det OIC at the time, recalls the planes being sent to Udorn Air Base in Thailand because of the increased rocket attacks. Flights continued over the GOT as usual, though, staged from Thailand. As always, a core team stayed behind in Da Nang. CTR3 Bill Erhardt, recognizing a deficiency in the det's supply of weapons, took the initiative in true Spook fashion. According to his own account, Bill "…took a couple cases of booze up to Hill 327 and brought back a jeep load of rifles, ammo, and hand grenades. The Chief wanted to kill me!"

New crypto systems installed April – June 1968 further improved the capabilities of the detachment.

Two Spooks Who Made Extraordinary Contributions

Late 1968 marked the departure of two experienced operators, Chuck Dibble and Joe Wagner. Both had flown in Da Nang for over two years, and their contributions were significant. In a personal message to Commander Johnson, the NSG Department head at NCSP, Captain De Lorenzi, Commanding Officer of VQ-1, cited both Petty Officers, stating in part,

"Both of these outstanding Petty Officers have made extraordinary contributions to the detachment operation over a sustained period of time. Their professionalism, devotion to duty and perseverance has on numerous occasions resulted in the development of extremely valuable intelligence, which under other circumstances could have gone unnoticed."

He then added in a later paragraph,

"Regret that I did not personally have the opportunity to speak with CT2 Dibble and

Wagner prior to their departure from Da Nang. Would be most appreciative if you would convey to each of them, on behalf of myself and all VQ-1 squadron members who have served with them a sincere 'Well Done' and best wishes for every success in the future."

Thus, despite the belief of some, VQ-1 recognized the efforts of the Spooks as a vital part of its mission, and was appreciative of what we did.

VQ-1 wasn't the only group who appreciated our work. Joseph A. Haran, Jr., a radio intercept analysis specialist with the 6924th Security Squadron (USAFSS) at Da Nang from 1968 to 1969, stated "*…the NSG linguists with whom I worked while at the 6924th Security Squadron were much more receptive to my efforts and were at the same time of immense help: "Mr. Dibble" and Ed Dobarro come to mind. The NSG guys were much more laid back and more job-as-top-priority oriented than the USAFSS turfdefenders. But, we were all in the same bunker (or roadside ditch) when the bad guys' rocket artillery and mortars said hello.*"

By LCDR Robert E. Morrison, USN (ret.)

2020-03-paulweiss-com-professionals-lionel-h-olmer-img1.jpg HC000A

EXPERIENCE

Of counsel in the Corporate Department, Lionel H. Olmer has represented a broad range of American and foreign companies. He has been successful in gaining access to markets for both foreign and domestic clients, in securing increased protection for clients' intellectual property rights; in advising regarding telecommunications policies; and in helping establish internal compliance programs to facilitate the licensing of sophisticated products for export.

He served as undersecretary of commerce for international trade beginning in February 1981. As head of the 2,300-person International Trade Administration (ITA), with offices throughout the United States and in more than 100 countries, he managed the trade promotion, export control regulations and trade law remedies of the U.S. government and negotiated trade agreements covering telecommunications, semiconductors, computers, medical equipment, steel and commercial aircrafts.

Before serving as undersecretary of commerce, Mr. Olmer worked for the Motorola Corporation. He coordinated that company's successful effort to become the first American exporter of communications products to Nippon Telegraph and Telephone Public Corporation, which at the time was a Japanese government-owned monopoly.

Mr. Olmer served for 12 years as a director of Dresser Industries, until its takeover by Halliburton Corporation and for 17 years was a director of SIPEX Corporation.

[Note : "In 1998, Dresser merged with its main rival Halliburton,[1] " ... meaning Olmer worked at Dresser from 1986 to 1998]

In 1999, he was appointed one of 14 commissioners on the U.S. National Security Commission for the 21st Century, which reported to the President as to the policies and organization for the pursuit of U.S. national security interests over the next quarter century. It led to the creation of the Department of Homeland Security.

Mr. Olmer received a Distinguished Alumni Award in 1998 and an honorary Doctor of Laws degree in May 2000 from the University of Connecticut. He is also a graduate of the National Defense University and serves on the board of directors of the University of Connecticut Foundation and the Nixon Center.

Massachusetts Institute of Technology (B.S., 1950; M.S., 1952)

Occupation

Engineer

Known for

Founding Digital Equipment Corporation with Harlan Anderson

Spouse(s)

Eeva-Liisa Aulikki Olsen

(m. 1950; died 2009)

Children

3

Kenneth Harry "Ken" Olsen (February 20, 1926[2] – February 6, 2011[3]) was an American engineer who co-founded Digital Equipment Corporation (DEC) in 1957 with colleague Harlan Anderson and his brother Stan Olsen.[4][5]

Background

Kenneth Harry Olsen was born in Bridgeport, Connecticut and grew up in the neighboring town of Stratford, Connecticut. His father's parents came from Norway and his mother's parents from Sweden. Olsen began his career working summers in a machine shop. Fixing radios in his basement gave him the reputation of a neighborhood inventor.

After serving in the United States Navy between 1944 and 1946, Olsen attended the Massachusetts Institute of Technology, where he earned both a BS (1950) and an MS (1952) degree in Electrical engineering.[6]

Career

pre-DEC

During his studies at MIT, the Office of Naval Research of the United States Department of the Navy recruited Olsen to help build a computerized flight simulator.[citation needed] Also while at MIT he directed the building of the first transistorized research computer. Olsen was an engineer who had been working at MIT Lincoln Laboratory on the TX-2 project.[7]

Olsen's most important connection to Project Whirlwind was his work on the *Memory Test Computer* (MTC), described as "a special purpose computer built to test core memory for the Whirlwind."[8] Unlike the 18-bit TX-0, which was "designed to be a predecessor for a larger 36 bit machine, the TX-2," Whirlwind and the MTC used 16 bits.[8]

Digital Equipment Corporation

In 1957, Olsen and an MIT colleague, Harlan Anderson, decided to start their own firm. They approached American Research and Development Corporation, an early venture capital firm, which had been founded by Georges Doriot, and founded Digital Equipment Corporation (DEC) after receiving $70,000 for a 70% share. In the 1960s, Olsen received patents for a saturable switch, a diode transformer gate circuit, an improved version of magnetic core memory, and the line printer buffer.[citation needed] (Note that MIT professor Jay W. Forrester is generally credited with inventing the first practical magnetic core memory).

Olsen was known throughout his career for his management style and his fostering of engineering innovation. Olsen's valuing of innovation and technical excellence spawned and popularized techniques such as engineering matrix management, that are broadly employed today throughout many industries.[9] Olsen valued humility, he drove an economy car and kept a simple office in an old mill building. He also was an accomplished pilot and flew his own plane.[10]

In 1977, referring to computers used in home automation at the dawn of the home computer era, Olsen is quoted as saying "There is no reason for any individual to have a computer in his home."[11][12][13][14][15] Olsen admitted to making the remark, even though he says his words were taken out of context and he was referring to computers set up to control houses, not PCs.[13] According to Snopes.com, "the out-of-context misinterpretation of Olsen's comments is considered much more amusing and entertaining than what he really meant, so that is the version that has been promulgated for decades now".[16]

In 1986, Fortune Magazine named Olsen "America's most successful entrepreneur",[17] and the same year he received the IEEE Engineering Leadership Recognition Award.[18] Olsen was the subject of a 1988 biography, *The Ultimate Entrepreneur: The Story of Ken Olsen and Digital Equipment Corporation* written by Glenn Rifkin and George Harrar.

In 1993, the Institute of Electrical and Electronics Engineers awarded Olsen their IEEE Founders Medal.[citation needed]

He was inducted as a Fellow of the Computer History Museum in 1996. He was awarded the Vermilye Medal in 1980. He was inducted as an Honorary Member of UPE (the International Honor Society for the Computing and Information Sciences) on October 8, 1975.[citation needed]

In 2011, he was listed at #6 on the MIT150 list of the top 150 innovators and ideas from MIT for his work on the minicomputer.[19]

Later career history

Commencing in 1987 Olsen in public appearances described UNIX as "snake oil".[20] Some believed he was making a general characterization of UNIX, while others believed he was specifically referring to its marketing exaggerating its benefits.[21] While Olsen believed VMS was a better solution for DEC customers and often talked of the strengths of the system, he did approve and encourage an internal effort to produce a native BSD-based UNIX product on the VAX line of computers called Ultrix. However, this line never got enthusiastic comprehensive support at DEC.[citation needed]

Olsen was forced to retire from DEC, stepping down as president in 1992.[22][23] He subsequently became the chairman of Advanced Modular Solutions. Olsen was also a major contributor to The Family, a religious and political organization.[24]

Olsen was a trustee of Gordon College in Wenham, Massachusetts.[25] There, the **Ken Olsen Science Center** was named after him in 2006,[26] and dedicated on 27 September 2008. Its lobby features a *Digital Loggia of Technology*, documenting Digital's technology and history, and an interactive kiosk to which former employees have submitted their stories.

Death

Olsen died while in hospice care in Indianapolis, Indiana on February 6, 2011, aged 84. Gordon College, where he was a trustee and board member, announced his death, but did not reveal the cause.[3][27] His family also did not comment on any details surrounding his death.[2]

Awards

- 1993: Institute of Electrical and Electronics Engineers in 1993 awarded Olsen the IEEE Founders Medal.[citation needed]
- 1996: The Computer History Museum in 1996 named Olsen a Museum Fellow "for his introduction of the minicomputer and co-founding of Digital Equipment Corporation (DEC)."[28]

Source - [HK004Y][GDrive]

One Health is at the intersection of human health, animal health, and environmental health.

One Health is "the collaborative efforts of multiple disciplines working locally, nationally, and globally, to attain optimal health for people, animals and our environment", as defined by the One Health Initiative Task Force (OHITF).[1]

History

[The] Greek physician Hippocrates (c. 460 BCE – c. 370 BCE) in his text "On Airs, Waters, and Places"[,] promoted the concept that public health depended on a clean environment.[3] In the mid-1800s, Rudolf Virchow, a physician, recognized the link between animal and human medicine, came up with the term zoonosis to describe a disease that can be passed from animals to humans, and actively advocated for veterinary medical education.[4] **The founding of the Veterinary Public Health Division at the Centers for Disease Control and Prevention (CDC) in 1947 by [Dr. James Hahn Steele (born 1913)], a veterinarian trained in public health, contributed to the understanding of how diseases are spread between animals and humans, or the epidemiology of zoonotic diseases.[4] [Dr. Calvin Walter Schwabe (born 1927)], another veterinarian trained in public health, coined the term One Medicine in a veterinary medical textbook in 1964, which reflects the similarities between animal and human medicine and stresses the importance of collaboration between veterinarians and physicians to help solve global health problems.[4] In 2004, The Wildlife Conservation Society held a conference at Rockefeller University in New York called One World, One Health, out of which the twelve Manhattan Principles were created.[5][6]** These principles highlighted links between humans, animals, and the environment, how these links are integral to understanding disease dynamics, and the importance of interdisciplinary approaches to prevention, education, investment, and policy development.[4]

interdisciplinary approaches to prevention, education, investment, and policy development.[9]

Due to global scares surrounding the H5N1 influenza outbreaks of the early-mid 2000s, the American Veterinary Medical Association established a One Health Initiative Task Force in 2006, the American Medical Association passed a One Health resolution to promote partnering between veterinary and human medical organizations in 2007, and a One Health approach was recommended for responses to global disease outbreaks in 2007.[5][4] Building on these initiatives, the Food and Agriculture Organization (FAO), World Organization for Animal Health (OIE), and World Health Organization (WHO) came together with the United Nations Children's Fund (UNICEF), United Nations System Influenza Coordination, and the World Bank to develop a framework entitled "Contributing to One World, One Health-A Strategic Framework for Reducing Risks of Infectious Diseases at the Animal-Human-Ecosystems Interface" in 2008, reiterating recommendations for a One Health approach to global health.[5][4] This framework was expanded and the aforementioned organizations moved into developing implementable policies surrounding One Health at the Stone Mountain Meeting, which was held in May 2010 in Georgia.[5][4]

The first international meetings with the topic of One Health were held in 2011 in both Africa and Australia.[5][4] In 2012, Barbara Natterson-Horowitz, a physician, and Kathryn Bowers, a science journalist, published the book Zoobiquity, which highlights case studies of parallels between animal and human health.[7] This book has spear-headed interdisciplinary research initiatives as well as a Zoobiquity conference series which have been held both in the United States and internationally.[8][9] In 2016, The [**One Health Commission**], One Health Platform, and One Health Initiative Team deemed International One Health Day to be November 3.[10] Organizations can submit event details for One Health Day through the One Health Commission's website for global recognition.[11]

In 2019, Senator Tina Smith and Representative Kurt Schrader introduced the Advancing Emergency Preparedness Through One Health Act into the United States Senate and House of Representatives, respectively.[12][13] This bi-partisan piece of legislation would require that the Department of Health and Human Services, Department of Agriculture, and other federal agencies develop a coordinated plan to create a One Health Framework to help prepare responses to zoonotic disease and prevent disease outbreaks.[14]

Leading organizations

The [**One Health Commission**] is a 501(c)3 non-profit organization with the mission to connect individuals and create relationships across human, animal, and environmental health sectors, as well as to educate the public about these issues with the intent to improve global health.[15][16] In 2007, Roger K. Mahr from the American Veterinary Medical Association, Jay H. Glasser from the American Public Health Association, and Ronald M. Davis from the American Medical Association came together as liaisons with other health science professionals, academics, students, government workers, and industry scientists to create a task force and have teleconferences to discuss One Health.[17][18] This One Health Initiative Task Force created a report in 2008 which outlined recommendations to create a joint steering committee, implement improved communications efforts, plan national One Health studies, develop a One Health Commission, create advisory teams, establish national meetings, and engage medical, veterinary, and public health students.[19][20] The One Health Commission was officially chartered in Washington D.C. in 2009, with Roger Mahr as the founding CEO.[17] A request for proposal for an institutional partner was put forth in 2010, and Iowa State University was selected to be the main site for operations.[17] In 2013, Roger Mahr retired from the commission and the operations site moved to the Research Triangle of North Carolina, where it currently resides.[17] The current executive director is Cheryl Stroud, a veterinarian, who has held the position since 2013.[21]

The **One Health Initiative** is an interdisciplinary movement to create collaborations between animal, human, and environmental health organizations including the American Veterinary Medical Association, American Medical Association, Centers for Disease Control and Prevention, United States Department of Agriculture, and the United States National Environmental Health Association, among others.[22] The website was created by a pro bono team of Laura H. Kahn, Bruce Kaplan, [**Dr. Thomas Patrick Monath (born 1940)**], Jack Woodall, and Lisa A. Conti to create an email distribution list as well as a repository for news and information pertaining to One Health.[23] Currently, 1,252 individuals from 76 countries are on the email list, and 972 individuals are on their initiative supporter list.[23]

The **One Health Platform** is a scientific reference network which unites researchers and experts of One Health to better understand and prepare for zoonotic disease outbreaks from animals to humans and antimicrobial resistance, including a better understanding of environmental factors that impact disease dynamics.[24] The organization has nine objectives, which include disseminating research results at biennial meetings, identifying knowledge gaps in the field, engaging policy makers, establishing a Bio Threats Scanning Group to connect One Health and global health security, share data, serve as a reference network to the government, foster collaborations, and implement policies, and increase awareness during One Health Day.[25] The management board is made up of Ab Osterhaus, John Mackenzie and Chris Vanlangendonck.[26] The One Health Platform is responsible for organizing the World One Health Congress meeting each year.[27]

The World Health Organization (WHO) was created on April 7, 1948 and has since expanded to include 150 country offices and six regional offices in addition to its headquarters in Geneva, Switzerland.[28] The WHO is the main authority for global health within the United Nations.[29] The WHO was a partner in the 2008 establishment of a strategic One Health framework for approaching global health problems.[5][4] In September 2017, a feature page for One Health was included on the WHO website, defining One Health and highlighting important topic areas such as food safety, zoonotic disease, and antimicrobial resistance.[30]

The World Organization for Animal Health was created as the Office International des Epizooties (OIE) via an international agreement signed on January 25, 1924 out of a need to combat animal disease outbreaks.[31] It officially became the World Organization for Animal Health in 2003, but retained its old acronym, and is headquartered in Paris, France.[31] The OIE has 182 member countries as of 2018 and is managed by a World Assembly of Delegates which includes representatives of each member country.[31] It was also a partner in establishing a strategic One Health framework in 2008.[5][4] The OIE works to maintain transparency surrounding global animal disease, collect and distribute veterinary information, publish international trade standards for animals/animal products, improve veterinary services globally, and to promote animal welfare and food safety.[32] Along with the WHO, the OIE hosts workshops about how to implement One Health networks and practices to improve health services in member countries.[33]

The Food and Agriculture Organization of the United Nations (FAO) is an agency of the United Nations, founded in 1945, to address global food security needs.[34] It is an organization that represents 194 member countries.[35] In 2011, the FAO put forth a strategic action plan for One Health, which had the objective to strengthen food security by improving animal production systems and veterinary services and called for action in improving collaborations between animal, human, and environmental health sectors.[36] The FAO works closely with the OIE and WHO, referred to all together as the Tripartite organizations, and published a new guide to approaching zoonotic disease with a One Health framework in 2019.[37]

The Centers for Disease Control and Prevention (CDC), located in Atlanta, Georgia, is an agency within the United States Department of Health and Human Services. The CDC was founded in 1946 by Joseph Mountin to prevent the spread of malaria.[38] The CDC created a One Health Office in 2009, becoming the

Services. The CDC was founded in 1946 by Joseph Mountin to prevent the spread of malaria.[38] The CDC created a One Health Office in 2009, becoming the first United States federal agency to have an office dedicated to this field.[39] This office works alongside other animal, human, and environmental health organizations both within the United States and across the world in order to increase the awareness of One Health and develop tools to help strengthen One Health movements.[39] The CDC One Health Office is involved with multiple initiatives, including working to implement a Zoonotic Disease Prioritization process, creating Global Health Security Agenda Action Packages, overseeing the Zoonoses Education Coalition, developing guidelines with the National Association of State Public Health Veterinarians, and helping educate youth involved with agriculture about influenza.[40] Additionally, the CDC One Health Office hosts monthly webinars, entitled the Zoonoses and One Health Updates Calls, to educate audiences about One Health issues including food safety, antimicrobial resistance, and recent disease outbreaks.[40]

International efforts

The One Health Zoonotic Disease Prioritization process is led by the CDC, holding workshops internationally to prioritize which zoonotic diseases are of the most concern and helping countries develop action plans to address those diseases.[41] The process involves 3-6 neutral facilitators representing human, animal, and environmental health sectors, up to 12 voting members which represent human health/public health, agriculture/livestock, wildlife/fisheries, the environment and other relevant government sectors, and 10-15 advisors from international organizations such as the CDC, WHO, FAO or OIE, academic partners, NGOs or other government sectors not directly involved in zoonotic diseases.[41] The CDC One Health Office trains facilitators and it takes months to prepare for a workshop to acquire resources, identify participants, review zoonotic diseases and confirm logistics.[41] Completed workshops have been held in a variety of countries including Pakistan, Tanzania, Thailand, Uzbekistan, China, and the United States with more workshops upcoming.[42] Diseases most commonly prioritized worldwide include rabies, brucellosis, influenza, Ebola virus, and Rift Valley fever.[42]

Additional organizations promoting international One Health efforts include the World Health Organization, Food and Agriculture Organization, World Organization for Animal Health,[43] The International Federation for Animal Health,[44] Global Alliance for Rabies Control,[45] New Zealand Centre for Conservation Medicine (NZCCM),[46] Hubnet in Asia[47] the One Health Global Network,[48] the University of California One Health Center,[49] Academic Hospital Utrecht and Utrecht Life Sciences [50] and the Infection Ecology and Epidemiology Network, Uppsala, Sweden.[51]

Zoonoses and Public Health

MEETING REPORT

Emerging Infections: A Tribute to the One Medicine, One Health Concept

R. E. Kahn[1], D. F. Clouser[2] and J. A. Richt[2]

[1] Avian Flu Action, Warrington, Cheshire, UK
[2] Diagnostic Medicine/Pathobiology Department, College of Veterinary Medicine, Kansas State University, Manhattan, KS, USA

Impacts

- A symposium on 'Emerging Infections: A Tribute to the One Medicine, One Health Concept' was held on 13 and 14 November 2008 at Kansas State University, Manhattan, Kansas, USA. Kansas State is part of the 'Kansas City Animal Health Corridor', with its universities and some 130 companies controlling one-third of the expenditure on animal health in the world.
- This Meeting Report with summaries of all 32 presentations stresses how human and veterinary medicine are evolving together, sharing research models for emerging pathogens, prion diseases, bunya and influenza viruses and emerging/re-emerging diseases.
- Mitigating zoonoses will require an integrated approach linking effective surveillance with environmental awareness and research to develop antiviral therapy and new vaccines, often within a perspective of systems biology.

Keywords:
Zoonotic disease; pathogens; prions; bunya viruses; influenza viruses; zoonotic infections

Summary

Events in the last decade have taught us that we are now, more than ever, vulnerable to fatal zoonotic diseases such as those caused by haemorrhagic fever viruses, influenza, rabies and BSE/vCJD. Future research activities should focus on solutions to these problems arising at the interface between animals and humans. A 4-fold classification of emerging zoonoses was proposed: Type 1: from wild animals to humans (Hanta); Type 1 plus: from wild animals to humans with further human-to-human transmission (AIDS); Type 2: from wild animals to domestic animals to humans (Avian flu) and Type 2 plus: from wild animals to domestic animals to humans, with further human-to-human transmission (Severe Acute Respiratory Syndrome, SARS). The resulting holistic approach to emerging infections links microbiology, veterinary medicine, human medicine, ecology, public health and epidemiology. As emerging 'new' respiratory viruses are identified in many wild and domestic animals, issues of interspecies transmission have become of increasing concern. The development of safe and effective human and veterinary vaccines is a priority. For example, the spread of different influenza viruses has stimulated influenza vaccine development, just as the spread of Ebola and Marburg viruses has led to new approaches to filovirus vaccines. Interdisciplinary collaboration has become essential because of the convergence of human disease, animal disease and a common approach to biosecurity. High containment pathogens pose a significant threat to public health systems, as well as a major research challenge, because of limited experience in case management, lack of appropriate resources in affected areas and a limited number of animal research facilities in developed countries. Animal models that mimic certain diseases are key elements for understanding the underlying mechanisms of disease pathogenesis, as well as for the development and efficacy testing of therapeutics and vaccines. An updated veterinary curriculum is essential to empower future graduates to work in an international environment, applying international standards for disease surveillance, veterinary public health, food safety and animal welfare.

efficacy testing of therapeutics and vaccines. An updated veterinary curriculum is essential to empower future graduates to work in an international environment, applying international standards for disease surveillance, veterinary public health, food safety and animal welfare.

The symposium, 'Emerging Infections: A Tribute to the One Medicine, One Health Concept', was held on 13 and 14 November 2008 at Kansas State University (KSU), Manhattan, Kansas, USA. The 32 presentations were linked to a general theme, as well as four workshops held consecutively on: (i) research models for emerging pathogens; (ii) prion diseases; (iii) bunya and influenza viruses; and (iv) emerging/re-emerging diseases. In addition, prior to the opening of the symposium, as part of KSU's Provost's Lecture on Excellence in Scholarship, **Dr Robert G. Webster** of St Jude Children's Research Hospital, Memphis, Tennessee, USA, spoke on 'Emergence and Control of Pandemic Influenza'.

Provost's Lecture on Excellence in Scholarship

Dr Webster first pointed out that among the known 16 haemagglutinin (HA) and nine neuraminidase (NA) subtypes of influenza A virus, the HA and NA subtypes were equally important and that the spikes that attach the virus to the respiratory tract were constantly changing. One mating of two different influenza A viruses could lead to 256 different influenza viruses. Inter-pandemic influenza based on H3N2 and H1N1 subtypes together led to 35 000 deaths a year in the United States (Horimoto and Kawaoka, 2005; Salomon and Webster, 2009). Therefore, it was important to prepare, manufacture and utilize effective annual vaccines for influenza. Although last year's vaccine had not been very effective because of the late emergence of a new strain, it was hoped that changes would make this year's vaccine more effective. In seeking to identify and counteract influenza viruses, extra effort needed to be put into surveillance, as demonstrated in Derek Smith's maps of viral evolution (Enserink, 2008; Russell et al., 2008).

The human dimension of an influenza pandemic was evident in the New Zealand experience in 1918, when the Minister of Health declined to quarantine the SS Niagara because it was carrying the Prime Minister and the result was that Auckland became a 'City of the Dead' (Rice, 2005). The origin of that world-wide 1918–1919 influenza pandemic, which probably began at Fort Riley, near Manhattan, Kansas (Barry, 2006), is now better understood because of the work of Taubenberger et al. (2005) who had sequenced the virus. It was found to be closely related to classical swine influenza isolated by Shope. This complete sequencing of the original 1918 virus had been greatly assisted by the retired pathologist, Johan Hultin, who recovered tissues frozen in permafrost in Brevig, Alaska, from the mummified corpse of a woman who had died from influenza and sent them to Taubenberger's team at the Armed Forces Institute of Pathology in Rockville, Maryland (Rozell, 1999/2005). Kobasa et al. (2007) have demonstrated from their work with macaques that atypical host innate immune responses may have contributed significantly to the lethality of that virus.

Figure 1 below describes the ecology of influenza viruses, which begins in the intestinal and respiratory tracts of shorebirds and wild ducks, before spreading to other species. The Ruddy Turnstone is a key bird spreading the virus to other avian species, in the midst of its annual migration from South America to Northern Canada. The complexities of the transmission of influenza viruses requires special consideration not only of H5 which has evolved into 10 different families or 'clades', but also of the global spread of H7, H2N3 and especially of H9N2, 'the sleeper in Asia', which donates six of the eight genes for H5N1. The spread of these different influenza viruses has stimulated influenza vaccine development, which currently indicates that inactivated oil emulsion vaccines are best in poultry while cold-adopted live vaccines and inactivated vaccines are about equally efficacious in humans; however, numerous issues remain to be resolved in the context of MDCK cells, tissue culture vaccines, adjuvants and for novel vaccine formulation (Hoffmann et al., 2000; Belshe, 2007).

The pros and cons for stockpiling human vaccines are finely balanced. The opposition to stockpiling is based on the awareness that any 'pre-pandemic' vaccine is unlikely to match the dominant strain that emerges to cause a pandemic. Furthermore, because of immune potentiation (an aberrant antibody response that increases virus uptake by cells), there is the possibility that a 'pre-pandemic' vaccination could lead to more serious disease signs. In addition, as the first infection in childhood with influenza virus leaves a lifelong immunological imprint (called 'antigenic sin'), later infection with antigenically related viruses can cause recall of immune responses to the original virus rather than to subsequent drift variants. There are also manufacturing issues linked to both the scale of

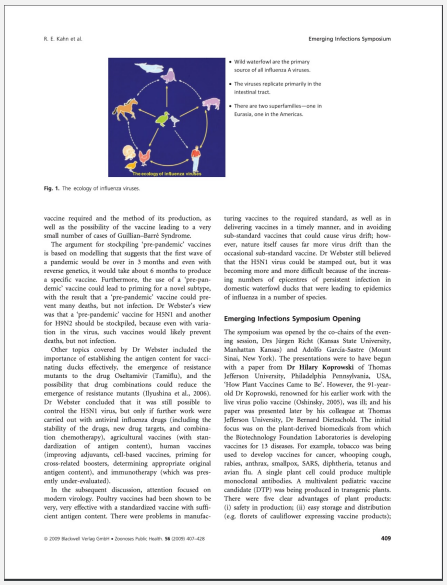

Fig. 1. The ecology of influenza viruses.

vaccine required and the method of its production, as well as the possibility of the vaccine leading to a very small number of cases of Guillian–Barré Syndrome.

The argument for stockpiling 'pre-pandemic' vaccines is based on modelling that suggests that the first wave of a pandemic would be over in 3 months and even with reverse genetics, it would take about 6 months to produce a specific vaccine. Furthermore, the use of a 'pre-pandemic' vaccine could lead to priming for a novel subtype, with the result that a 'pre-pandemic' vaccine could prevent many deaths, but not infection. Dr Webster's view was that a 'pre-pandemic' vaccine for H5N1 and another for H9N2 should be stockpiled, because even with variation in the virus, such vaccines would likely prevent deaths, but not infection.

Other topics covered by Dr Webster included the importance of establishing the antigen content for vaccinating ducks effectively, the emergence of resistance mutants to the drug Oseltamivir (Tamiflu), and the possibility that drug combinations could reduce the emergence of resistance mutants (Hyushina et al., 2006). Dr Webster concluded that it was still possible to control the H5N1 virus, but only if further work were carried out with antiviral influenza drugs (including the stability of the drugs, new drug targets, and combination chemotherapy), agricultural vaccines (with standardization of antigen content), human vaccines (improving adjuvants, cell-based vaccines, priming for cross-related boosters, determining appropriate original antigen content), and immunotherapy (which was presently under-evaluated).

In the subsequent discussion, attention focused on modern virology. Poultry vaccines had been shown to be very, very effective with a standardized vaccine with sufficient antigen content. There were problems in manufacturing vaccines to the required standard, as well as in delivering vaccines in a timely manner, and in avoiding sub-standard vaccines that could cause virus drift; however, nature itself causes far more virus drift than the occasional sub-standard vaccine. Dr Webster still believed that the H5N1 virus could be stamped out, but it was becoming more and more difficult because of the increasing numbers of epicentres of persistent infection in domestic waterfowl ducks that were leading to epidemics of influenza in a number of species.

Emerging Infections Symposium Opening

The symposium was opened by the co-chairs of the evening session, Drs Jürgen Richt (Kansas State University, Manhattan Kansas) and Adolfo García-Sastre (Mount Sinai, New York). The presentations were to have begun with a paper from **Dr Hilary Koprowski** of Thomas Jefferson University, Philadelphia Pennsylvania, USA, 'How Plant Vaccines Came to Be'. However, the 91-year-old Dr Koprowski, renowned for his earlier work with the live virus polio vaccine (Oshinsky, 2005), was ill; and his paper was presented later by his colleague at Thomas Jefferson University, Dr Bernard Dietzschold. The initial focus was on the plant-derived biomedicals from which the Biotechnology Foundation Laboratories is developing vaccines for 13 diseases. For example, tobacco was being used to develop vaccines for cancer, whooping cough, rabies, anthrax, smallpox, SARS, diphtheria, tetanus and avian flu. A single plant cell could produce multiple monoclonal antibodies. A multivalent pediatric vaccine candidate (DTP) was being produced in transgenic plants. There were five clear advantages of plant products: (i) safety in production; (ii) easy storage and distribution (e.g. florets of cauliflower expressing vaccine products);

[page 408]

The symposium, 'Emerging Infections: A Tribute to the One Medicine, One Health Concept', was held on 13 and 14 November 2008 at Kansas State University (KSU), Manhattan, Kansas, USA. The 32 presentations were linked to a general theme, as well as four workshops held consecutively on: (i) research models for emerging pathogens; (ii) prion diseases; (iii) bunya and influenza viruses; and (iv) emerging/re-emerging diseases. In addition, prior to the opening of the symposium, as part of KSU's Provost's Lecture on Excellence in Scholarship, Dr Robert G. Webster of St Jude Children's Research Hospital, Memphis, Tennessee, USA, spoke on 'Emergence and Control of Pandemic Influenza'.

Provost's Lecture on Excellence in Scholarship

Dr Webster first pointed out that among the known 16 haemagglutinin (HA) and nine neuraminidase (NA) subtypes of influenza A virus, the HA and NA subtypes were equally important and that the spikes that attach the virus to the respiratory tract were constantly changing. One mating of two different influenza A viruses could lead to 256 different influenza viruses. Inter-pandemic influenza based on H3N2 and H1N1 subtypes together led to 35 000 deaths a year in the United States (Horimoto and Kawaoka, 2005; Salomon and Webster, 2009). Therefore, it was important to prepare, manufacture and utilize effective annual vaccines for influenza. Although last year's vaccine had not been very effective because of the late emergence of a new strain, it was hoped that changes would make this year's vaccine more effective. In seeking to identify and counteract influenza viruses, extra effort needed to be put into surveillance, as demonstrated in Derek Smith's maps of viral evolution (Enserink, 2008; Russell et al., 2008).

The human dimension of an influenza pandemic was evident in the New Zealand experience in 1918, when the Minister of Health declined to quarantine the SS Niagara because it was carrying the Prime Minister and the result was that Auckland became a 'City of the Dead' (Rice, 2005). **The origin of that world-**

wide 1918–1919 influenza pandemic, which probably began at Fort Riley, near Manhattan, Kansas (Barry, 2006), is now better understood because of the work of Taubenberger et al. (2005) who had sequenced the virus. It was found to be closely related to classical swine influenza isolated by Shope. This complete sequencing of the original 1918 virus had been greatly assisted by the retired pathologist, Johan Hultin, who recovered tissues frozen in permafrost in Brevig, Alaska, from the mummified corpse of a woman who had died from influenza and sent them to Taubenberger's team at the Armed Forces Institute of Pathology in Rockville, Maryland (Rozell, 1999/2005). Kobasa et al. (2007) have demonstrated from their work with macaques that atypical host innate immune responses may have contributed significantly to the lethality of that virus.

Figure 1 below describes the ecology of influenza viruses, which begins in the intestinal and respiratory tracts of shorebirds and wild ducks, before spreading to other species. The Ruddy Turnstone is a key bird spreading the virus to other avian species, in the midst of its annual migration from South America to Northern Canada. The complexities of the transmission of influenza viruses requires special consideration not only of H5 which has evolved into 10 different families or 'clades', but also of the global spread of H7, H2N3 and especially of H9N2, 'the sleeper in Asia', which donates six of the eight genes for H5N1. The spread of these different influenza viruses has stimulated influenza vaccine development, which currently indicates that inactivated oil emulsion vaccines are best in poultry while cold-adopted live vaccines and inactivated vaccines are about equally efficacious in humans; however, numerous issues remain to be resolved in the context of MDCK cells, tissue culture vaccines, adjuvants and for novel vaccine formulation (Hoffmann et al., 2000; Belshe, 2007).

The pros and cons for stockpiling human vaccines are finely balanced. The opposition to stockpiling is based on the awareness that any 'pre-pandemic' vaccine is unlikely to match the dominant strain that emerges to cause a pandemic. Furthermore, because of immune potentiation (an aberrant antibody response that increases virus uptake by cells), there is the possibility that a 'pre-pandemic' vaccination could lead to more serious disease signs. In addition, as the first infection in childhood with influenza virus leaves a lifelong immunological imprint (called 'antigenic sin'), later infection with antigenically related viruses can cause recall of immune responses to the original virus rather than to subsequent drift variants. There are also manufacturing issues linked to both the scale of vaccine required and the method of its production, as well as the possibility of the vaccine leading to a very small number of cases of Guillian–Barre´ Syndrome.

[page 409]

The argument for stockpiling 'pre-pandemic' vaccines is based on modelling that suggests that the first wave of a pandemic would be over in 3 months and even with reverse genetics, it would take about 6 months to produce a specific vaccine. Furthermore, the use of a 'pre-pandemic' vaccine could lead to priming for a novel subtype, with the result that a 'pre-pandemic' vaccine could prevent many deaths, but not infection. Dr Webster's view was that a 'pre-pandemic' vaccine for H5N1 and another for H9N2 should be stockpiled, because even with variation in the virus, such vaccines would likely prevent deaths, but not infection.

Other topics covered by Dr Webster included the importance of establishing the antigen content for vaccinating ducks effectively, the emergence of resistance mutants to the drug Oseltamivir (Tamiflu), and the possibility that drug combinations could reduce the emergence of resistance mutants (Ilyushina et al., 2006). Dr Webster concluded that it was still possible to control the H5N1 virus, but only if further work were carried out with antiviral influenza drugs (including the stability of the drugs, new drug targets, and combination chemotherapy), agricultural vaccines (with standardization of antigen content), human vaccines (improving adjuvants, cell-based vaccines, priming for cross-related boosters, determining appropriate original antigen content), and immunotherapy (which was presently under-evaluated).

In the subsequent discussion, attention focused on modern virology. Poultry vaccines had been shown to be very, very effective with a standardized vaccine with sufficient antigen content. There were problems in manufacturing vaccines to the required standard, as well as in delivering vaccines in a timely manner, and in avoiding sub-standard vaccines that could cause virus drift; however, nature itself causes far more virus drift than the occasional sub-standard vaccine. Dr Webster still believed that the H5N1 virus could be stamped out, but it was becoming more and more difficult because of the increasing numbers of epicentres of persistent infection in domestic waterfowl ducks that were leading to epidemics of influenza in a number of species.

Emerging Infections Symposium Opening

The symposium was opened by the co-chairs of the evening session, Drs Ju¨rgen Richt (Kansas State University, Manhattan Kansas) and Adolfo Garcı´a-Sastre (Mount Sinai, New York). The presentations were to have begun with a paper from Dr Hilary Koprowski of Thomas Jefferson University, Philadelphia Pennsylvania, USA, 'How Plant Vaccines Came to Be'. However, the 91-yearold Dr Koprowski, renowned for his earlier work with the live virus polio vaccine (Oshinsky, 2005), was ill; and his paper was presented later by his colleague at Thomas Jefferson University, Dr Bernard Dietzschold. The initial focus was on the plant-derived biomedicals from which the Biotechnology Foundation Laboratories is developing vaccines for 13 diseases. For example, tobacco was being used to develop vaccines for cancer, whooping cough, rabies, anthrax, smallpox, SARS, diphtheria, tetanus and avian flu. A single plant cell could produce multiple monoclonal antibodies. A multivalent pediatric vaccine candidate (DTP) was being produced in transgenic plants. There were five clear advantages of plant products: (i) safety in production; (ii) easy storage and distribution (e.g. florets of cauliflower expressing vaccine products); (iii) needle-free ease of administering to humans and animals through various orifices; (iv) expression of multiple antigens in one plant; and (v) low cost and speed of production.

[page 410]

Dr Robert G. Webster then tackled the question, 'H5N1 Avian Influenza: Has the Threat Been Overblown?' His basic answer was 'No', although the virus is now off the front pages of news reports. Avian influenza (AI) is caused by a negative sense RNA virus that possesses a segmented genome and since it has no proofreading mechanisms, replication is error-prone, resulting in antigenic variation. Among the HA subtypes, H5 is currently considered to have the highest capacity to cause pandemic influenza. The currently circulating highly pathogenic (HP) H5N1 virus emerged in Southern China in 1996 and was first detected on a goose farm in Guangzhou Province. In May 1997, the H5N1 virus killed six people in Hong Kong and was detected in wet markets in Hong Kong. The avian virus in its highly pathogenic form has now spread to multiple epicentres in over 60 countries and over 500 million poultry have died or been slaughtered.

It would appear that migratory birds are capable of spreading the virus, but are not the primary cause of the spread, and that 10 distinguishable clades are now being detected, largely in infected domestic poultry. However, it should be noted that domestic waterfowl appear to be the primary source of infection for poultry, although unhygienic conditions in commercial poultry farms and within wet markets are also playing an important role in the global spread of the virus. There is considerable dispute about the causes of the spread of the virus, but its high virulence is clear. While the virus is killing chickens often in less than a day, as well as ducks in 1–2 days, large numbers of people are not being killed because the virus does not at this time have the capacity to spread from human to human due in part to failure to reach the lower human respiratory tract (Van Riel et al., 2006; Shinya et al., 2006).

There are many different views, but key issues remain unresolved: What is the reservoir? Who are the spreaders? What is driving the antigenic diversity?

Ducks, especially domestic ducks placed in rice fields and then moved to other areas, have become a Trojan horse, carrying influenza viruses, but not being harmed by them, while transferring viruses in a form that is virulent in other species (Gilbert et al., 2008). Finkelstein et al. (2007) examined the common amino acids found in the Spanish 1918, Asian 1957 and Hong Kong 1968 pandemic viruses. There were 13 common amino acids, but only one of them has been found in the PB2 in the Asian H5N1 viruses. However, it should be noted that Finkelstein and his colleagues found changes in PB2, PA, NP, M1 and NS1. So far the H5N1 viruses have not yet acquired the amino acids associated with the past three pandemics.

The Asian H5N1 HPAI virus will probably transmit to poultry in the Americas soon, but the precise date and method of transmission cannot be predicted. There is a low probability that the means of transmission will be migratory birds, some probability from frozen meat, but a high probability of the spread of the avian virus from smuggled birds (including fighting cocks).

Malik Peiris (personal communication) has noted that there is currently a low probability of a highly lethal H5N1 human pandemic, but if it does occur its impact will be catastrophic if over 60% of infected people die, as is currently the situation for the limited number of human cases (Salomon and Webster, 2009).

Silvio Pitlik, MD (Rabin Medical Center, Beilinson Hospital, Petah Tikva, Israel) presenting 'One Health, One Medicine – A Clinician's Perspective', pointed out that prior to 1981, in the pre-AIDS era, there were only four papers listed in PubMed on emerging infections. However, there were now more than 1000 per year. The AIDS epidemic is the leading paradigm of emerging infections. Based on old literature data and more recently, on viral archaeology, the primal detection and immediate response to the epidemic was delayed by several decades. With the recent endorsement of the American Veterinary Medical Association of the 'One Health' initiative, the time had come for veterinarians, physicians and scientists to work together on many emerging zoonoses, especially HIV/AIDS (AVMA, 2008).

Dr Pitlik proposed a 4-fold classification of emerging zoonoses: Type 1: from wild animals to humans (Hanta); Type 1+: from wild animals to humans, with further human-to-human transmission (AIDS); Type 2: from wild animals to domestic animals to humans (Avian flu); and Type 2+: from wild animals to domestic animals to humans, with further human-to-human transmission (SARS). The resulting holistic approach to emerging infections links microbiology, veterinary medicine, human medicine, ecology, public health and epidemiology. All of these disciplines were important to understand how wild animals could transmit disease to both domestic animals and humans, as well as how domestic animals could transmit disease to humans.

The recently revived concept of 'one medicine, one health' implicates a multidisciplinary and co-ordinated response which promises to improve our capacity to deal more effectively with new emerging infections. Veterinarians and physicians can increasingly co-ordinate their efforts to cope with zoonotic threats. For example, during the large outbreak of West-Nile virus infections in Israel in 2000, a multidisciplinary team of public health specialists, veterinarians and physicians acted in a co-ordinated way to cope effectively with the outbreak. Also, in many sporadic cases of various zoonotic infections, a multidisciplinary approach resulted in a successful management of the clinical cases.

[page 411]

In an overview, 'In Vivo Disease Modeling of High Containment Pathogens' Dr Heinz Feldmann (Rocky Mountain Laboratories, Division of Intramural Research Labs, National Institute of Allergies and Infectious Diseases, National Institutes of Health, Hamilton, Montana, USA) pointed out that high containment pathogens posed a significant threat to public health systems, as well as a major research challenge, because of limited experience in case management and a lack of appropriate resources. Dr Feldmann had recently moved from the Special Pathogens Program of the National Microbiology Laboratory of the Public Health Agency of Canada to become Laboratory Chief at the new biosafety level 4 laboratory at Rocky Mountain Laboratories (Backus, 2008). He explained that animal models which mimic disease are key elements for the understanding of the underlying mechanisms of disease pathology, as well as for the development and efficacy testing of therapeutics and vaccines. Studies in reservoir species are rare; and animal models which mimic the reservoir host and the transmission of the pathogen to humans are limited.

Small animal models, in particular the mouse, are the most feasible in high containment and they offer the most options for research due to greater access of immunological and genetic tools. However, their mimicry of human disease as well as their predictive value for therapeutic efficacy is often limited thereby making them, at best, valuable initial screening tools for pathophysiology, treatment and vaccine studies.

Future efforts need to focus on finding more relevant small animal models through pathogen adaptation or by the use of genetically altered host or pathogen species. In parallel, much needed immunological and genetic tools for new animal models should be developed. This would help reduce the numbers and use of large animal models in high containment which is associated with ethical issues, as well as higher exposure risks and higher expenses.

Recent research into the highly pathogenic Marburg and Ebola viruses suggests that fruit bats are a reservoir species (Leroy et al., 2005) carrying these viruses at a subclinical level, which with the appropriate stimulation (e.g. pregnancy, starvation or co-infection) could be reactivated and transmitted (Strong et al., 2008). Considerable progress has been made in developing a live, attenuated recombinant vaccine, making use of Cynomolgus macaques as animal models (Jones et al., 2005). Assessment of the recently reconstituted 1918 influenza virus resulted in high virulence for Cynomolgus macaques. Infected animals mounted an immune response, characterized by disregulation of the antiviral response that was insufficient for protection, indicating that atypical host innate immune responses may contribute to lethality (Kobasa et al., 2007).

Dr Albert Osterhaus (Erasmus University, Rotterdam, the Netherlands), presented a virological overview of 'Research on Respiratory Viruses'. As Morens et al. (2004) had pointed out, respiratory diseases and HIV/ AIDS were the two most significant causes of deaths from infectious diseases. It would require 'the ultimate virologist' to summarize the many new human respiratory viruses and consider how to control them. As emerging 'new' respiratory viruses are identified with increasing frequency in many wild and domestic animals, issues of interspecies transmission have become of increasing concern. For example, replication of highly pathogenic H5N1 AI virus associated with more or less severe signs and death has been has been documented in several species of wild ducks (Keawcharoen et al., 2008), domestic cats (Kuiken et al., 2006), red foxes (Reperant et al., 2008) and tigers and leopards (Keawcharoen et al., 2004). The development of safe and effective vaccines for humans and animals has become a priority and besides adjuvanted vaccines, recombinant modified vaccinia virus (Ankarastrains) vaccine proved to be a promising alternative vaccine candidate that could be used for the induction of protective immunity against various H5N1 influenza strains (Kreijtz et al., 2007). International collaboration and co-ordination of all stakeholders are essential for the future control of many emerging infections that cross the species barrier.

In a subsequent morning welcome to participants, Dr Jon Wefald, President of Kansas State University expressed his belief that the 'One Health, One Medicine, One World' theme is beginning to resonate around the world and that emerging problems require extensive collaboration between individuals and disciplines. Dr M. Duane Nellis, Provost of Kansas State University, praised the work of the Homeland Defense Food Safety and Security Team (Brown and King, 2008; Rhodes, 2008) and stressed the university-wide mission of Kansas State University to address the global food security crisis. Dr Ralph Richardson, Dean of the College of Veterinary Medicine, Kansas State University, spoke of the convergence of human disease, animal disease and

Richardson, Dean of the College of Veterinary Medicine, Kansas State University, spoke of the convergence of human disease, animal disease and biosecurity, focusing on the 'Kansas City Animal Health Corridor' between Manhattan, Kansas, Kansas City and Columbia, Missouri with its universities and some 130 companies controlling one-third of the expenditure on animal health in the world. The aim of the College of Veterinary Medicine was 'to reach excellent people, to collaborate and to do things of significance' (see http://www.vet.k-state.edu).

[page 412]

Thomas Thornton, President of Kansas Bioscience Authority concluded the welcomes with a challenge to participants to work together on bioscience work, noting that funding for collaboration was available to those who were ready to 'walk the talk'. In his view, research was the foundation of a bioscience economy, especially as we have much to lose from an incident and much to gain from research. Manhattan, Kansas, with its new Biosecurity Research Institute, was on the final short list for the possible relocation of the National Bio and Agro-Defense Facility from Plum Island NY (Jolley, 2008). (Note: Manhattan, Kansas was selected in December 2008 by the Department of Homeland Security as the location of the new Bio and Agro-Defense Facility).

Dr Paul-Pierre Pastoret [World Organisation for Animal Health (OIE), Paris] concluded the Symposium Opening with a presentation, 'One World, One Health: An OIE Perspective'. Dr Pastoret expressed his strong support for the symposium and congratulated Dr Richt on the opening of his new laboratory. However, both OIE and the Food and Agricultural Organization (FAO) preferred the term 'One World, One Health' to 'One Medicine, One Health', because even though human and veterinary medicines are evolving hand-in-hand, there would always remain differences between them, due to philosophical and economic reasons. Two recent joint OIE/FAO publications set out the OIE/FAO vision (Vallat and Mallet, 2006; New Delhi, 2007). Earlier thematic issues of the OIE's Scientific and Technical Review have been devoted to zoonoses and wildlife (Brown, 2004; Hugh-Jones, 2006), as well as climate change (de la Rocque, 2008).

The OIE was created in 1924, with the aim of controlling the international spread of infectious animal diseases. From this original mission, a new mandate has emerged, to improve animal health worldwide, in 172 member countries and territories. This mandate can only be fulfilled if new institutional and technical mechanisms are developed at global, regional and national levels. To succeed, the OIE must now provide policy makers with the right information, arguments and tools in order for political will and good governance to be exercised effectively and in a sustainable manner.

Both food-borne and non-food-borne zoonoses are economically significant, as veterinary medicine works increasingly at the interface between human and animal health. A comprehensive review made at the beginning of this century identified 1415 species of infectious organisms known to be pathogenic to humans, including 538 bacteria and rickettsia, 307 fungi, 287 helminths, 217 viruses and prions and 66 protozoa (Cleaveland et al., 2001). Of these infectious organisms, 868 (61%) were classified as zoonotic; and 175 pathogenic species, of which 75% were zoonotic, were considered to be associated with emerging diseases, the vast majority coming from wildlife. In Dr Pastoret's view, the prevention and control of zoonoses would only be possible with effective implementation of OIE standards and guidelines linked to the World Trade Organization (2008) Agreement on Sanitary and PhytoSanitary measures.

Dr Pastoret reflected that even if animal medicine in the developed world seems nowadays more interested in food safety than food security, we should never forget that there are still developing countries where food security is a major problem. With regard to livestock production, world demand for animal protein (milk, eggs, meat) is expected to rise by 50% by 2020. This growing demand for animal protein will be fuelled by both an increase in the world's human population from 7 to 9 billions by 2050, as well as changing dietary habits for hundreds of millions of poor households in emerging countries who are joining the middle classes. Furthermore, livestock production, often threatened by diseases, plays a considerable role in the survival of poor rural communities in developing countries, where a large percentage of human population still depends on livestock breeding to survive. Effective control of animal diseases in developing countries would help provide access to valuable markets, which are currently closed to those countries not yet able to control or eliminate important so-called 'foreign animal' diseases.

Workshop I: Research Models for Emerging Pathogens

Dr James Swearengen (Association for Assessment and Accreditation of Laboratory Animal Care International, Frederick, Maryland, USA) began the workshop with a presentation entitled 'Animal Models of Infectious Disease: Challenges in Biocontainment'. He considered four challenges: (i) oversight of animal care and use; (ii) veterinary care; (iii) handling potential exposures; and (iv) risk assessment. Facing the first challenge begins with obtaining the necessary membership for the Institutional Animal Care and Use Committee (IACUC). The most problematic issue regarding IACUC membership is identifying a non-affiliated member with the necessary security clearances needed to review classified research proposals should the need arise. From a safety perspective, the IACUC can assist in identifying safety concerns during the protocol review process, especially when animals are expected to become ill and require more frequent handling. Furthermore, it is often difficult to define endpoint criteria, especially when clinical signs progress rapidly. Establishing effective endpoint criteria which do not rigidly confine the investigator should be the goal. Pilot studies may be a useful tool in collecting the information necessary for this purpose. Infectious diseases often result in pain or distress in animals that must be relieved. If analgesics are withheld, there must be a detailed justification for doing so. This justification should provide specific reasons why the analgesics would prevent the necessary data from being collected and the mechanism of their interference. The IACUC should scrutinize these justifications to ensure they have the information necessary to make an informed, science-based decision.

[page 413]

Second, the strict entry and exit requirements of high containment make veterinary care and health monitoring very labor-intensive. Telemetry and video surveillance are often useful adjuncts to direct observations of animals. Extensive training and mentoring are critical to assuring good veterinary care can be provided safely and in a timely manner. Many times, financial incentives are necessary to obtain the highly trained staff needed to work in a high containment environment.

Third, historical data have shown that the two most significant routes of exposure of personnel to infectious agents in a laboratory setting are by aerosol and percutaneous inoculation (Rusnak et al., 2004a). Special attention should be given to the use of sharps (e.g. needles), sharp edges on equipment and caging and bites and scratches from animals. Risk categories and treatment options need to be established in extensive pre-exposure planning. One described method for pre-exposure planning involves developing categories of exposure risk (e.g. negligible to high) and then applying them in context of the route of exposure (Rusnak et al., 2004b). Animal studies bring with them a whole new set of risk factors when dealing with infectious organisms; and exposures to these organisms must be anticipated.

Fourth, risk assessment needs to be conducted frequently, in some cases daily, with recognition that new safety precautions might be required to face unexpected situations. For example, an animal's disposition can change quickly with the onset of clinical signs, requiring daily risk assessment and development of ways to mitigate new risks as they occur.

While new challenges and risks may occur in a highlevel biocontainment environment, diligent planning and forethought can substantially reduce these risks, as well as provide assurance of meeting regulatory requirements for using animals in research.

Dr Michael Katze (Department of Microbiology, Washington National Primate Center, University of Washington, Seattle, Washington, USA) asked 'Can Systems Biology and the Computer Save the World from the Next Pandemic' and responded 'Yes, but it better happen soon'. The viruses being investigated in Dr Katze's laboratories are influenza, Ebola, Marburg, Vaccinia, Herpes Simplex, Hepatitis C, SARS, measles, West Nile Virus (WNV), HIV-1, HIV-2, SIV (Simian immunodeficiency virus) and Lassa. A central question that Dr Katze raised was: 'Can we take advantage of systems biology, computational tools and mathematical models to help the world develop an AIDS vaccine, one quarter of a century after the emergence of HIV?' In his view, the failure to defeat AIDS was significant evidence that virologists were not doing a good job developing effective drugs and vaccines.

Admittedly, the host response to any virus infection is highly complex. Systems biology, when properly understood and practised, could tackle that complexity. A helpful definition of systems biology had been given by Denis Noble (2008): 'Systems biology...is about putting together rather than taking apart, integration rather than reduction. It requires that we develop ways of thinking about integration that are as rigorous as our reductionist programs, but different.... It means changing our philosophy, in the full sense of the term'. In Dr Katze's view, virologists could use systems biology and genomics to: (i) study the global impact of virus infection on host gene expression; (ii) discover cellular regulatory pathways targeted by viruses; (iii) identify new cellular targets for antiviral therapy; (iv) develop new vaccines; and (v) make new discoveries (Tan et al., 2007). In his own laboratory, a long range goal was to develop an 'Influenza and Respiratory Virus Compendium', which would ensure the creation of a centralized data base to catalogue all transcriptional events in cells and organs infected by influenza and other virulent respiratory viruses.

A systems biological tool box should contain four key tools: (i) sequencing of genomes (i.e. the complete set of genetic material in the cell of a living organism); (ii) the use of microarrays (i.e. a high throughput technique to examine global gene expression in cells and tissues at the RNA level; (iii) the use of proteomics (i.e. a high throughput technique to examine global gene expression in cells and tissues at the protein level); and (iv) the use of bioinformatics (i.e. computational biology to help make sense of massive data sets). At times, the challenge could appear overwhelming, but it was now clear that an integrated approach to viral respiratory disease is a complex three-step process: (i) the use of cell culture, mouse and other animal models to study viral infection; (ii) the combination of traditional histophathological, virological and biochemical approaches with functional genomics and proteomics; and (iii) obtaining the signatures of virulence and insights into mechanisms of host defence response, viral evasion and pathogenesis (Katze et al., 2008).

Much had been achieved. We can indeed identify molecular signatures of disease progression. In select cases, we can predict disease progression and identify prognostic biomarkers. We can distinguish between infections by highly pathogenic and low pathogenic viruses. We can define distinct mechanisms by which viruses evade the host defences.

[page 414]

Much remains to be achieved. The limitations of classical hypothesis-driven approaches should be recognized. The computer needs to be used for data analysis, not just e-mail and PowerPoint. Our work is not simply about the virus and virus replication and viral encoded inhibition of host signalling. We need to recognize that a very early and uncontrolled innate and inflammatory host response often causes the pathology associated with virus infection (even in AIDS): kinetics is vital. To develop effective antiviral therapies and vaccines, we should be targeting host pathways rather than viral enzymes. It is important that more computer biologists work together with biologists, as virologists and computational types learn to trust each other.

Opening the symposium in place of Dr Koprowski, Dr Adolfo Garcı´a-Sastre (Department of Microbiology, Department of Medicine, and Emerging Pathogens Institute, Mount Sinai School of Medicine, New York, USA) explained his current research on the 'Inhibition of Type 1 IFN Responses by RNA Viruses'. The type I interferon (IFN) system is one powerful first line of innate immune defence against virus infections. However, many, if not all, viruses, have acquired during evolution IFN antagonist proteins that overcome this host antiviral response. For influenza viruses, the viral non-structural NS1 protein prevents IFN production, while for dengue virus and for nairoviruses, the viral polymerase proteins have acquired domains responsible for inhibition of the IFN system. Interestingly, although all three viruses inhibit the IFN system by diverse and distinct mechanisms, all of them target components of the ubiquitination machinery to achieve IFN antagonism. Subversion of ubiquitination pathways appears to be a general means by which RNA viruses can evade innate immunity.

Dr Thomas Geisbert (Boston University Medical School of Medicine, Boston Massachusetts, USA) presented 'Progress in the Development of VSV-Based Vaccines to Prevent and Treat Ebola and Marburg Hemmorhagic Fever'. He explained that there were currently at least five different vaccine systems showing promise in protecting non-human primates against Ebola and Marburg viruses. These five approaches to filovirus vaccines were based on virus-like particles, DNA, two replication-defective viral vector systems and a replicating virus vector. In the context of replicating virus vectors, a vaccine based on recombinant vesicular stomatitis virus (rVSV) has been shown to protect nonhuman primates against Ebola and Marburg vaccines, eliciting completely protective immune responses, as well as being effective when the vaccine was administered as a post-exposure treatment (Jones et al., 2005; Daddario-DiCaprio et al., 2006a, Daddario-DiCaprio et al., 2006b).

There were specific advantages to using a rVSV as a vaccine vector: (i) Vaccination with a live virus characteristically elicits strong humoral and cellular responses and results in production of long-lasting memory B cells and T cells; (ii) VSVs are able to accommodate large gene inserts and multiple genes in their genomes without dramatically affecting virus growth; no upward limit to the amount of foreign sequence inserted in the VSV genome has been identified; (iii) VSV's singlestranded RNA genome does not undergo reassortment and therefore lacks the potential of reassorting with wild type viruses in vivo; (iv) VSV replicates within the cytoplasm of infected cells and does not undergo genetic recombination; and (v) the seroprevalence of VSV antibodies within the general human population is extremely low and there is a lack of serious pathogenicity in humans.

In the midst of this encouraging initial research, certain questions now need to be investigated: Is there interference between vaccine components? What dose confers protection? What is the mechanism of protection? In the context of safety, what happens with individuals with altered immune systems? Regarding post-exposure treatment, what combination approaches would improve protection and extend the therapeutic window?

Dr Chieko Kai (Institute of Medical Science, University of Tokyo, Japan) outlined the 'Molecular Determinants of Nipah Virus Pathogenicity'. Nipah virus (NiV) is a paramyxovirus that was first discovered in 1999 as a zoonotic virus during an outbreak of infection in pigs and humans in Malaysia. More than a million pigs died or were killed. The biological property of NiV to infect a wide range of hosts and to produce a disease causing significant mortality in humans has made NiV infections a public heath concern.

However, the molecular mechanisms for the high pathogenicity have not yet been fully clarified. Dr Kai and her colleagues have established a reverse genetic system that enabled the rescue of replicating recombinant NiVs from a cloned cDNA, and showed that the rescued rNiV retained the severe pathogenicity in an animal model by experimental infection. By generating a recombinant NiV expressing EGFP they suggested that additional factors

pathogenicity in an animal model by experimental infection. By generating a recombinant NiV expressing EGFP, they suggested that additional factors besides the cellular receptor are required for full NiV replication (Yoneda et al., 2006).

They further investigated accessory proteins of NiV (V, W and C). These accessory proteins of paramyxoviruses have been suggested to be involved in pathogenicity; and the P, V and W proteins of NiV have been shown to function as inhibitors of IFN signalling. To study the role of these accessory proteins in NiV infection, they generated recombinant NiV lacking V, W or C protein by the reverse genetics system. All the recombinant viruses replicated well in cell culture, although the maximum titres of them were slightly different compared with the parental rNiV. The virulence of the recombinant viruses in a hamster model is now under investigation. She concluded that the reverse genetics for NiV provides a powerful tool for the analysis of the molecular mechanisms of pathogenicity and cross-species infection.

Dr James Robl (Hematech Inc, Sioux Falls, South Dakota, USA), with his colleagues Yoshimi Kuroiwa and Poothapillai Kasinathan, presented 'Production of Recombinant Human Polyclonals in Transchromosomic Cattle'. They explained how a genetically modified bovine system had been created for the production of hyperimmune human polyclonal antibodies. Because of respective limitations associated with using humans as donors, many potential applications of human polyclonal antibodies have not previously been realized. Therefore, it was necessary to incorporate into the cow genome the entire unrearranged human heavy and light chain immunoglobulin loci, as well as inactivate the bovine immunoglobulin genes. A cloned embryo was transplanted into a surrogate cow; transgenic calves were born; the genetically modified cows were immunized; and bulk material was collected.

The detailed process for the production of fully human polyclonal antibodies in cows has a number of important steps. The human immunoglobulin genes are introduced into the bovine genome using a human artificial chromosome (HAC) vector constructed from fragments of hChr14 (heavy chain) and hChr 22 (lambda light chain). The HAC vector is introduced into fetal bovine fibroblast cells using a microcell-mediated chromosome transfer approach. Modified cells are used for embryonic cloning to produce live transchromosomic calves. In this process, the HAC is retained at a high rate and immunoglobulin genes undergo rearrangement and express human antibody. Gene inactivation is performed using a sequential targeting system for fetal fibroblast cells to knock out both alleles of the bovine gene encoding immunoglobulin.

In a more general context, it is useful to note that with genetic modification technologies, multiple genetic modifications can be made without breeding. Genes can be targeted (e.g. bovine genes can be knocked out) and microchromosome transfers can be used to transfer large sequences of DNA (Kuriowa et al., 2004). Thus, the prion gene can be knocked out of cattle, eliminating BSE susceptibility and potential transmittance (Richt et al., 2007). The immunogloblulin heavy chain gene can also be knocked out of cattle, eliminating competition with human antibody production (Kuriowa et al., 2002).

The practicalities of gene modification are straightforward. The gene targeting approach requires two and a half months for one targeting. There is successful targeting of both active and silent genes, with allele-specific targeting. Calves are successfully produced following three rounds of sequential cloning and there is rapid generation of multiple targeting events without germ line transmission. A full health evaluation of each cow is made at planned intervals covering growth rate and a physical examination, blood chemistry, haematology, histopathology, immune system function, brain function and reproduction. It takes about 18 months to produce a live calf.

The HAC vectors used in this process are autonomous replicating vectors, which can carry Mb of DNA and there is no requirement for integration into endogenous chromosomes. The three essential components are a centromere, two telomeres and origins of replication.

The outcome of this on-going research has been that live homozygous knockout calves have been produced by embryonic cloning. Successful application of these technologies will be critical for the development of a bovine system for production of hyperimmune human polyclonal antibodies. These bovine-derived human polyclonal antibodies have therapeutic applications for infectious disease, immune deficiency, organ rejection, toxin/venom neutralization, autoimmune diseases, cancer and biodefense.

Workshop II: Prion Diseases

Dr Cristina Casalone (National Reference Centre of BSE, Istituto Zooprofilattico di Piemonte, Liguria e valle d'Aosta, Italy) presented 'BSE and BASE: An Update', based on her research with her colleagues Maria Caramelli, Cristiano Corona and Chiara Porcario. Bovine spongiform encephalopathy (BSE or Mad Cow Disease) had long been thought to be caused by a single prion strain. Starting from 2004, however, approximately 40 atypical BSE cases, referable to two different strains, defined as H- and L-type, were identified worldwide. Dr Casalone described the two types of surveillance that the Reference Centre in Italy conducts: passive and active. To date, Italy has reported 142 positive cases of BSE from 5 million tested cases with most cases being reported before 2003. In 2004, Dr Casalone's group in collaboration with Dr Gianluigi Zanusso (Department of Neurological and Visual Science, Verona) and Dr Fabrizio Tagliavini (Istituto Neurologico 'Carlo Besta') discovered a different type of BSE very unlike previously reported classical BSE (cBSE) cases. The 'new' BSE was termed Bovine Amyloidotic Spongiform Encephalopathy (BASE) and described as an L-type since the unglycosylated protein part migrated lower. Dr Casalone noted that BASE localizes in the forebrain, whereas cBSE appears to affect mainly brainstem. (Casalone et al., 2004).

In vivo studies indicate low transmission rates for BASE in wild-type mice. C57/BL mice only became infected after a second passage and then the infection appears to be cBSE-like (Capobianco et al., 2007). In cattle, BASE is transmissible after the first passage and shorter incubation times were reported, suggesting that BASE may be more virulent than cBSE in the natural host (Lombardi et al., 2008). Dr Casalone concluded that BASE is either a sporadic disease or a totally different form of BSE. Distinct molecular phenotypes have been identified in bovine prion diseases (Biacabe et al., 2004) leading to the description of C- and H-type.

In more recent studies, it has been shown that BASE is transmissible to humanized transgenic mice (Kong et al., 2008), whereas Comoy and colleagues (2008) used macaques to illustrate the point. Dr Casalone concluded that BASE has at least the same human health implications as those of cBSE. The good news is that presently both the Italian and US protocols are able to detect/identify both cBSE and atypical cases. As of 30 October 2008, there were 41 atypical BSE cases identified worldwide; 21 L-type, 3 BASE and 17 H-type. Therefore, the preventive measures currently in place for human and animal health protection should be maintained indefinitely.

Dr Michael Clawson (US Department of Agriculture, Agricultural Research Service, US Meat Animal Research Center, Clay Center, Nebraska) discussed the 'Association of a Bovine Prion Gene Haplotype with Atypical BSE' on the basis of his research with various colleagues (Clawson et al., 2008). Transmissible spongiform encephalopathies (TSEs), also known as prion diseases, are a class of fatal neurodegenerative disorders that occur in humans, ruminants, cats and mink. Three distinct TSEs afflict cattle: cBSE, atypical H-type BSE and atypical L-type BSE. Classical BSE was identified in the 1980s and is acquired by cattle through the consumption of feed contaminated with the infectious prion agent. As noted in the previous presentation, atypical BSEs have only recently been recognized as distinct cattle prion diseases and are extremely rare. The full extent of genetic susceptibilities to atypical BSEs remains unknown; however, one atypical H-type case identified in the United States in Alabama in 2006 was most likely caused by a genetic mutation in the prion gene, E211K (Richt and Hall, 2008).

Dr Clawson's group has recently sequenced the prion gene (PRNP) of 192 cattle (including 96 beef and 96 dairy cattle), first, to identify polymorphisms and secondly, to test PRNP variation for an association with BSE (Clawson et al., 2006). They identified 382 polymorphisms in beef cattle and 158 in dairy cattle and subsequently identified an association of a bovine prion DNA sequence (haplotype) with atypical BSE that is independent of E211K. Despite the low frequency of this haplotype among general cattle populations, it was present in a majority of H- and L-type atypical BSE cases from Canada, France and the United States. This result indicates that there is a genetic component to atypical BSE susceptibility in addition to E211K. Dr Clawson concluded that cattle PRNP variation is complex, that there are distinct bovine PRNP alleles associated with both classical and atypical BSE susceptibility and that a portion of BSE can be managed through genetics.

Dr Qingzhong Kong (Department of Pathology, Case Western Reserve University, Cleveland, Ohio, USA) presented 'Chronic Wasting Disease (CWD) and Bovine Spongiform Encephalopathy (BSE): Public Health Risk Assessment' in the light of his research with 18 colleagues. Transmissible spongiform encephalopathy is a family of fatal, transmissible neurodegenerative diseases that affect humans and a variety of animals. The human forms of the disease include Creutzfeldt–Jacob disease (CJD), Gerstmann-Straussler-Scheinker disease, Fatal Familial Insomnia and Kuru. Among animals, the disease takes the form of BSE in cattle, scrapie in sheep and goats and CWD in deer, elk and moose (Collinge, 2001).

It has been shown that TSE results from the misfolding of the highly conserved prion protein (PrP) and that the cellular PrP (PrPc) is essential for both prion replication and prion pathogenesis. However, the detailed mechanisms of prion replication and pathogenesis remain to be solved. There are neither treatments for prion diseases nor reliable diagnostic tests for early-stage TSE.

Chronic Wasting disease was first discovered in Colorado in 1967 and is endemic in 14 US States and two provinces in Canada. CWD has been experimentally transmitted to other animals, including cattle, sheep, ferrets, mice, hamsters and squirrel monkeys; however, the transmissibility of CWD to humans was unknown. The species barrier for prion transmission is determined by the PrP sequence homology between the donor and the recipient as well as the prion strain. The research by Kong and his colleagues with humanized and cervidized transgenic mouse models indicates the current natural CWD strain has a very low possibility of direct transmission to humans with PrP-129MM; however, novel cervid strains highly infectious to humans could emerge.

Dr Kong then explained his studies with both cBSE and atypical BSE (BASE) cases (Kong et al., 2008). Atypical BSE has been found in eight European countries, as well as in the USA, Canada and Japan. His on-going research with humanized Tg mice demonstrates that both L- and H-type atypical BSE strains are transmissible to humans and the L-type seems to be much more virulent than the cBSE strain in humans. No transmission of the E211K mutant BSE has been observed thus far.

[page 417]

Dr Alan Young (Department of Veterinary Science, South Dakota State University, Brookings, South Dakota, USA), supported by six collaborators, continued the study of TSEs in Workshop II with his study, 'Fixed and Migratory Leukocytes in the Pathogenesis of TSEs'. To better understand the role of the immune system with regard to prions, they sought to answer three questions: (i) By what mechanism is PrPres delivered to the germinal centres? (ii) What are the molecular events occurring in PrPresinfected germinal centers? and (iii) How is PrPres disseminated systemically throughout the lymphoid system?

In their initial experiment, Dr Young and his lab team cannulated sheep afferent lymphatic vessels to define the transport of PrPSc from the local tissue to the regional lymph node. They demonstrated that prion entry is via the afferent lymphatics within 24 h of injection. Transport was achieved through cell-free delivery in the first 15 min and through cell associated delivery pathway peaking 12–24 h following injection. In the second set of experiments, Dr Young's group cannulated the efferent lymphatics of lymph nodes infected with sheep scrapie prions to determine the potential role(s) of circulating lymphocytes in prion pathogenesis (Young et al., 1997). Lymph was collected from the efferent duct, and changes in the leucocyte subsets were monitored. They concluded that measurable changes in the output of B cell subsets following a scrapie infection suggested a specific local response to prion infection.

In the final series of experiments, Dr Young's group tracked the kinetics of PrPSc appearance in the lymph node germinal centres following injection. They observed the immediate localization of PrPSc in the germinal centers within 30 min of inoculation. Interestingly, highly susceptible sheep (Q171Q genotype) could maintain PrPres in the node for up to 2 months post-injection, whereas sheep with a Q171R genotype only maintained the PrPres in the node for 1–2 weeks. This result points towards susceptibility and resistance to scrapie.

Dr Young concluded that the data from these experiments suggest a two-phase pathogenesis for prion disorders. In the first phase, prions are transported to regional germinal centers similar to other antigens; and in the second phase, prions appear to replicate within the lymphatic tissue of susceptible but not resistant animals, thus establishing long-term infection of affected lymph nodes (Catron et al., 2004; Pape et al., 2007).

Dr Anumantha Kanthasamy (Department of Biomedical Sciences, Iowa Center for Advanced Neurotoxicology, Iowa State University, Ames, Iowa, USA) ended the Workshop II presentations with a study supported by six colleagues, 'Divalent Metals Stabilize Cellular Prion Proteins and Alter the Rate of Proteinase-K Dependent Limited Proteolysis' (Kanthasamy et al., 2008). The key biochemical event in the pathogenesis of prion diseases is the conversion of normal cellular prion proteins (PrPc) to the proteinase K (PK) resistant, abnormal form (PrPsc); however, the cellular mechanisms underlying the conversion remain enigmatic. Binding of divalent cations such as copper to the octapeptide repeat regions of PrP has been shown to be important for the stability of the protein (Choi et al., 2006). Nevertheless, the roles of other divalent cations in the normal processing of cellular PrPc are not well understood.

Dr Kanthasamy and his team examined the role of divalent metals (Mn^{2+} and Cu^{2+}) on PrPc expression and degradation in cell culture and brain slice models. Neuronal cells expressing mouse prion proteins with a genetically altered novel epitope (mAb 3F4) and brain slices were exposed to Mn^{2+} and Cu^{2+} over 24 h. Levels of PrPc protein and mRNA were measured. Limited proteolysis, mRNA stability, proteasomal activity and pulse-chase experiments were conducted. The objectives of these experiments were: (i) to determine the effect of cellular prion on mitochondrial dysfunction and oxidative damage, (ii) to evaluate whether or not divalent metals influence the stability of the prion protein, and (iii) to understand the role of such metals in the pathogenesis of prion diseases.

Interestingly, his studies concluded that manganese enhances the stability of the prion protein. During metal exposures, cellular prion protein levels increase without an increase in mRNA levels or a decrease in protein degradation. The effect of manganese on the prion protein is different from other metals such as cadmium. Additionally, the normal prion protein protects neuronal cells against manganese induced acute neurotoxic response. These experiments support the hypotheses that certain divalent metals may play a critical role in the pathogenesis and progression of prion diseases.

Workshop III: Bunya and Influenza Viruses

Dr Richard Elliott, working with his colleague Dr Xiaohong Shi, both of the Centre for Biomolecular Sciences, University of St. Andrews, of St. Andrews, Scotland presented 'Engineering the Bunyavirus Genome'. Bunyaviruses are characterized by a tripartite, negative sense RNA genome and impinge on (i)

human health by causing diseases such as encephalitis (e.g. La Crosse virus) and haemorrhagic fever [e.g. Crimean–Congo haemorrhagic fever virus and Rift Valley fever (RVF) virus]; (ii) animal health by causing diseases such as RVF, Cache Valley and Akabane viruses or (iii) crop plants by causing diseases such as tomato spotted wilt virus. This family contains prime examples of emerging and re-emerging viruses, including the hanta viruses presented next.

[page 418]

Dr Ellott's group developed a highly efficient reverse genetics system to recover the prototype bunyavirus, Bunyamwera (BUNV), from cloned cDNA (Lowen et al., 2004) and this system was subsequently adopted by others to recover La Crosse and RVF viruses. They exploited this technology to engineer the BUNV genome to create viruses carrying specific marker tags in different viral proteins. Thus far they have recovered recombinant BUNV expressing epitope-tagged L protein (Shi and Elliott, 2009) and NSm (Shi et al., 2006) and Gc proteins (X. Shi, J. van Mierlo, A. French and R.M. Elliott, unpublished) fused to green fluorescent proteins. These recombinant viruses are useful tools to monitor the time course of BUNV infections, as well as illustrating the plasticity of the Bunyamwera virus genome.

Dr Ramon Flick, Chief Scientific Officer of the BioProtection System Corporation, Ames, Iowa and formally the Director of the BioScience Level 4 Facility of University of Texas Medical Branch, Galveston, Texas, explained how 'Hantavirus Reverse Genetics Challenges Replication Dogma'. Hantaviruses belong to the Bunyaviridae family of viruses, are transmitted by aerosolized rodent excreta or rodent bites and are a major international public health concern. Their ability to produce serious, often fatal, human disease underlines the possible use of these viruses as biological weapons and the need for a system that allows manipulation of the viruses. Basic research empowers the identification of antiviral targets, the screening of relevant antiviral compounds and the creation of subunit vaccines. Furthermore, as set out in the first three presentations of Workshop III, the advent of reverse genetics of negative-stranded RNA viruses has made it possible to manipulate these viruses at will and to evaluate the effects of these changes on the biology and pathogenesis of many viruses, as well as the efficacy of antiviral and prophylactic measures (Walpita and Flick, 2006).

A reverse genetics technology for Hantaan (HTN) virus, the prototype of the genus Hantavirus, has now been established (Flick et al., 2003). This system consists of HTNV genome segment-based minigenomes containing different reporter genes. The viral proteins necessary for minigenome replication are provided by either HTNV-superinfection (helper virus-driven system) or by co-transfected HTN-L/N expression plasmids (plasmiddriven system). Overall, the surprising results question previously accepted dogmas in the negative strand RNA virus field: (i) the highly conserved parts of the genome segment ends are described as the putative promoter region for segmented negative-stranded RNA viruses; however, minigenomes lacking these regions are still able to serve as a template for efficient viral replication and (ii) the viral nucleoproteins described as absolutely essential for viral replication processes (the naked RNA genome cannot serve as a template for the viral RNA polymerase) are not required as trans-acting factors for efficient minigenome transcription and replication. This knowledge is an important step towards the understanding of the special features of the hantaviral replication cycle and for the development of targeted antiviral drug strategies.

Dr Stuart T. Nichol, Chief of the Molecular Biology Laboratory, Special Pathogens Branch, National Center for Zoonotic, Vector-borne and Enteric Diseases, Centers for Disease Control and Prevention (CDC) Atlanta, Georgia, USA set out a study of 'Rift Valley Outbreak Dynamics and Reverse-Genetics Generated Vaccine' in which he and 18 colleagues had collaborated (Bird et al., 2008a,b). Rift Valley fever virus is a mosquito-borne human and veterinary pathogen associated with large disease outbreaks throughout Africa, Madagascar and the Arabian Peninsula. Infection of livestock can result in sweeping 'abortion storms' and high mortality among young animals. Human infection results in self-limiting febrile disease that in 1–2% of patients progress to more serious complications including hepatitis, encephalitis, retinitis or a haemorrhagic syndrome with high fatality.

The most recent large RVF outbreak occurred in eastern Africa in 2006–2007, particularly Kenya, southern Somalia and Tanzania. Following initial RVF virus laboratory confirmation, a high-throughput RVF diagnostic facility was established at the Kenyan Central Veterinary Laboratories in Kabete, Kenya, to support the real-time identification of infected livestock and to facilitate outbreak response and control activities. Detailed analysis of 3250 livestock and wildlife specimens in Kenya showed evidence of RVF infection in almost 10% of animals tested across 23 Districts. The complete S, M and/or L genome segment sequence was obtained from 31 representative RVF virus specimens. Analyses revealed the concurrent circulation of multiple virus lineages, gene segment reassortment and common ancestry of the 2006– 2007 outbreak viruses with those from the 1997–1998 eastern Africa RVF outbreak. Evidence of recent increases in virus genomic diversity and gene pool size 2–4 years prior to the 2006–2007 outbreak was also found, indicating ongoing RVF virus activity and evolution during the inter-epizootic/epidemic period.

Such findings highlight the need for safe and effective vaccines. Reverse-genetically produced double-deleted vaccine was tested. All vaccinated animals subsequently challenged with a high dose of virulent RVF virus survived infection and could be serologically differentiated from naive experimentally infected animals by the lack of NSs antibodies. These rationally designed marker RVF vaccine viruses show great promise for use in combating this significant veterinary and public health threat.

[page 419]

Dr Ruben Donis of the Molecular Virology and Vaccines Branch, Influenza Division, Center for Disease Control (CDC) Atlanta, Georgia, USA presented an analysis of 'Influenza Pandemic Preparedness: Early Detection and Vaccination'. He began by underscoring the possibly catastrophic impact of a severe and unmitigated pandemic in the United States: 1.9 million deaths, 9.9 million hospitalizations, 40 million people in outpatient care and a total of 90 million people infected (33% of the US population). Worldwide, between 175 and 350 million deaths are possible (Meltzer et al., 1999; Fedson, 2005). Seven steps could help mitigate such a pandemic: (i) medical care; (ii) community intervention; (iii) social distancing; (iv) personal protective equipment; (v) targeted use of antiviral drugs; (vi) pre-pandemic vaccine; and (vii) pandemic vaccine. Within this framework of possible mortality mitigation programmes, the CDC has set out five influenza pandemic preparedness goals and objectives: (i) prevent or delay a pandemic; (ii) detect and report a pandemic, seeking to decrease the time needed for detection; (iii) investigate the course of a pandemic, seeking to decrease the time needed to determine risk factors and appropriate interventions; (iv) control a pandemic, decreasing the time needed to provide countermeasures; and (v) recover from a pandemic (CDC, 2008).

The two inherent viral risk factors that might cause a pandemic are influenza virus reassortment and genetic drift. Genetic changes caused by either reassortment of a particular virus or mutations in the HA or other genes could lead to increased pathogenicity and the possibility of sustained human-to-human transmission. Of particular concern is the possible reassortment of human H3N2 viruses with avian H5N1 viruses (Chen et al., 2008). Mutations in HA adapt the avian virus to bind sialic acid receptors in human respiratory cells (Stevens et al., 2006). Structural differences near the HA receptor binding pocket alter the effect of mutations in receptor binding specificity. For example, when comparing A/Vietnam/ 1203/2004 with A/Indonesia/05/2005 viruses, there are multiple amino acid differences near the pocket that may affect receptor binding. Research is continuing, but there is some evidence that recent avian H5N1 viruses are exhibiting an increased propensity for acquiring human receptor specificity by mutations in the receptor binding site (Stevens et al., 2008).

The evolution of influenza A viruses has considerable impact on vaccine production and distribution. Protection for both human and animal hosts is mediated

The evolution of influenza A viruses has considerable impact on vaccine production and distribution. Protection for both human and animal hosts is mediated by neutralizing antibodies to HA. Protective immunity is strain-specific and the vaccine antigen must match circulating virus strains. The efficacy of pre-pandemic stockpile is compromised by the rapid change in the antigenic properties of the viruses (antigenic drift). Three H5N1 candidate vaccines for Clades 1, 2.1 and 2.3 have been distributed by CDC to manufacturers; some clinical trials have been completed; others are underway to determine their efficacy. Multiple genetically distinct H5N1 clades co-circulate in birds and any of them could emerge as a pandemic, especially as the H5 evolution in birds leads to rapid diversification of these viruses. Therefore, permanent surveillance and updating of the CDC vaccine seed library is necessary to maximize antigenic match and the efficacy of an eventual pandemic vaccine.

Dr Hana Weingartl of the National Centre for Foreign Animal Disease (NCFAD) of the Canadian Food Inspection Agency and the Department of Medical Microbiology, University of Manitoba, Winnipeg, Manitoba, Canada presented a paper on 'Human 1918 Pandemic Influenza in Experimentally Infected Swine' (Weingartl et al., 2009). The aim of the paper was to increase understanding of the natural history of the pandemic influenza virus during the twentieth century and its interspecies transmission. A better understanding of the biology of the 1918 virus will encourage recognition of the risk potential of circulating animal viruses to initiate human pandemics, leading to novel targets for therapeutic and prophylactic intervention.

It was only in the early 1930s that the 1918 influenza virus was clearly identified as a viral disease in both people and swine (Shope, 1931; Smith et al., 1933; Laidlaw, 1935). Genomic sequence data suggest that 1918 genes are all avian-like and that a change of receptor specificity in 1918 from avian to mammalian required only a few amino acid changes in the HA. Speaking on behalf of the 11 co-authors, Dr Weingartl explained the methodology of determining the virulence of the rescued 1918 (r1918) pandemic human influenza H1N1 virus, which was related to the A/swine/Iowa/15/1930 rescued virus (r1930). Both above viruses were rescued using the plasmid-derived reverse genetic technology. Mice, ferrets and macaques infected with the r1918 virus died, but pigs did not develop severe respiratory distress or become moribund. All work with the 1918 pandemic influenza virus was performed in the NCFAD biosafety level 4 facility. The clinical disease of r1918 was similar to the disease introduced by the r1930 H 1N1 virus.

The resulting data support the hypothesis based on phylogenetic analysis that the human pandemic influenza virus which began in the spring of 1918 is likely an ancestor of the classical swine H 1N1 influenza virus. The human 1918 pandemic influenza virus might have originated directly from an unknown avian or another source (e.g. via swine), rapidly acquiring the minimal adaptive changes required to start a pandemic, possibly just before or quickly after the cross over to humans. Precisely how and when the human virus went into swine, or the swine virus went into humans, is not fully understood. However, it is clear that improved virus surveillance in humans, other mammals and birds is critical to prevent inter-species transmission in the future

[page 420]

Dr Gregory Gray MD of the Center for Emerging Infectious Diseases, University of Iowa College of Public Health, Department of Epidemiology, Iowa City, Iowa, USA set out 'Evidence for Swine, Avian and Equine Influenza Virus Infections in Man'. In a series of epidemiological studies among workers with intense exposure to animals (Gray et al., 2008), Dr Gray and his colleagues found considerable evidence that swine workers (Myers et al., 2006; Gray et al., 2007), poultry workers (Ortiz et al., 2007), hunters (Gill et al., 2006) and veterinarians (Myers et al., 2007) have experienced zoonotic influenza A virus infections. While a majority of these infections were either mild or subclinical, these epidemiological data suggest that animal workers have the potential to contribute to the generation of novel viruses and serve as a bridging population for influenza virus between animals and humans.

Mathematical modelling has demonstrated that such workers may accelerate the spread of pandemic viruses (Capuano et al., 2007). The body of research indicates that public health interventions are essential to mitigate the public health risks. The highest priority is to focus resources on country-specific epidemiological studies targeted at understanding both disease and transmission in animals and humans. Studies are required to identify risk for humans, linked with surveillance in industrial settings, village farms and markets (Planning Group, 2005). Crossspecies virus transmission has clearly caused the emergence of new epidemic diseases (Parrish et al., 2008). The transfer of viruses to new hosts may take many years, but is of great significance, as, for example, in the recent efficient transmission of equine influenza virus to dogs (Crawford et al., 2005; Enserink, 2005).

Dr Wolfgang Garten of the Institute of Virology, Phillips-Marburg University, Marburg, Germany spoke of 'Viral Glycoproteins Cleaved by Cellular Proteases'. Dr Garten's presentation focused on glycoproteins of viruses that are contained within lipid envelopes of enveloped viruses (Klenk et al., 1984). He began by pointing out that glycoproteins of many lipid-enveloped viruses are proteolytically cleaved by host cell proteases (i.e. proteolytic enzymes) to gain their biological functionality. Most viral glycoproteins are cleaved at a single distinct peptide motif within the ectodomain to attain fusion capacity. For example, in the context of the influenza virus, the level of receptor-dependent restriction of an AI virus in the human airway epithelium can be estimated; and these estimates support a theory that alteration of the receptor specificity of an avian virus could facilitate its human-to-human transmission (Matrosovich et al., 2007). Some viral proteins acquire additional properties, for example, a selective incorporation into the virus envelope.

Within this framework of how viral proteins acquire additional properties, Dr Garten explained that additional cleavages may also occur. Therefore, it is necessary to investigate further the cleavage sites of viral glycoproteins, the responsible cellular proteases, the localization of the cleavage events, the roles of glycoprotein cleavage and the inhibition of cleavage. It is essential to understand how the different protease inhibitors interfere with the proteolytic processing of viral glycoproteins and thus with virus replication. For HIV-1, the role of furin and PC/LPC (a serine endoprotease of the subtilisin family, expressed in most mammalian cells) is of particular importance in initiating infection (Hallenberger et al., 1992, 1997).

Further work at the Institute of Virology by Dr Garten and his colleagues considered influenza virus pathogenicity (Garten and Klenk, 1999, 2008), proteolytic processing of Marburg virus glycoprotein (Volchkov et al., 2000) and how the Lassa virus matrix protein is the driving force for virus particle release (Strecker et al., 2003). Much of this basic research has considerable practical implications in developing new strategies to combat virus infection (Boettcher et al., 2009). Dr Garten reported the tree-dimensional structure of the matrix protein of Borna disease virus (BDV), which is a tetramer and possesses the capacity for binding of an RNA of about 16 nucleotide length as well as lipid (Neumann et al., 2009).

Workshop IV: Emerging/Reemerging Diseases

Dr Bernhard Dietzschold of the Department of Microbiology and Immunology at Thomas Jefferson University, Philadelphia, Pennsylvania, USA, presented 'Borna Disease and Rabies: Two Old Reemerging Zoonotic Virus Infections' about two of the oldest infectious diseases on record that are now reemerging in many parts of the world. BDV or a BD-like virus was recently detected in both wild and domesticated psittacine birds (Honkavuori et al., 2008, Kistler et al., 2008), while canine rabies is rapidly spreading throughout Southern and Eastern Africa with devastating effects on public and animal health. Both BDV and rabies virus (RV) are highly neurotropic in nature, negative strand viruses and are able to infect a large variety of mammals, probably including birds.

Professor Dietzschold pointed out that BDV and RV have huge differences in their respective pathogenesis even though these two diseases share many common features. For example, RV replicates in the cytoplasm, whereas BDV replicates in the nucleus. [...]

2011 (March 23) - One Health and the Lessons Learned from the 1999 West Nile Virus Outbreak (MWV46)

Also see : Dr. Tracey S. McNamara (born 1954)

In episode 46 of MicrobeWorld Video, filmed at the American Association for the Advancement of Science Meeting in Washington, D.C., Dr. Stan Maloy talks with Tracey McNamara, professor of pathology at Western University of Health Sciences College of Veterinary Medicine, about her role as the head pathologist at the Bronx Zoo during the 1999 West Nile virus outbreak in New York City. As several local residents were hospitalized with encephalitis of unknown origin, many crows and exotic zoo birds were dying off. It was determined that the patients had St. Louis encephalitis (SLE) which is transmitted to humans by mosquitoes that got the virus from infected birds. However, birds with SLE do not get sick and a possible connection between the dying crows and human cases was dismissed by many experts.

McNamara suspected there was more to this story because of the large number of birds that were also contracting encephalitis and struggled to make her voice and preliminary research heard that suggested a new disease may be emerging in North America. It wasn't until she connected with researchers at the US Army Medical Research Institute in Infectious Diseases (USAMRIID) in Ft. Detrick, Maryland, who quickly confirmed that the virus that was killing the crows and her birds at the Bronx Zoo was West Nile virus, a disease endemic to Africa and parts of Europe that also infects people.

McNamara's experience has made her a champion of One Health -- "a call to action for collaboration and cooperation among health science professions, academic institutions, governmental agencies, non-governmental organizations, and industries towards improved assessment, treatment, and prevention of cross-species disease transmission and mutually prevalent, but non-transmitted, human and animal diseases and medical conditions."

2016 (June) - The One Health Movement; Animals, Environment, and Us | Ralph Richardson | TEDxICC

Jun 16, 2016 / TEDx Talks / Live Youtube Link : https://www.youtube.com/watch?v=_xMbxLjn37w / Full video copy : [HV00FN][GDrive] / Image of Youtube download page : [HV00FO][GDrive]

This talk takes a holistic approach to health by tying humans to the environment and animals. Dr. Ralph Richardson became dean and CEO of the K-State Olathe campus in August 2015 after serving for 17 years as dean of the College of Veterinary Medicine at Kansas State University. He is a Diplomat of the American College of Veterinary Internal Medicine (Specialty of Internal Medicine) and a Charter Diplomat in the American College of Veterinary Internal Medicine (Specialty of Oncology). He graduated from Kansas State University's College of Veterinary Medicine in 1970 and served as a captain in the United States Army Veterinary Corps from 1970 to 1972. He completed an Internship at Purdue University in Small Animal Medicine and Surgery in 1973 and a Residency at the University of Missouri-Columbia in Small Animal Internal Medicine in 1975. In 1978 Dr. Richardson completed a Training Program in Clinical Oncology at the University of Kansas Medical Center-Kansas City. This talk was given at a TEDx event using the TED conference format but independently organized by a local community. Learn more at http://ted.com/tedx

One Health Commission

The One Health Commission is a globally focused organization dedicated to implementing One Health and One Health actions around the world. As a 501(c)(3) organization, chartered in Washington, D.C**. in 2009,** it is dedicated to raising awareness and educating all audiences about the importance of transcending institutional and disciplinary boundaries to transform the way that human, animal, plant, and ecosystem health professionals work together.

The Commission seeks to 'Connect' One Health Advocates and Stakeholders, to 'Create' networks and teams that work together across disciplines to 'Educate' about One Health and One Health issues.

- **'Connect'** those working for One Health around the world to facilitate needed synergistic relationships and collaborations at all levels of academia, government, policy and research. See organizational 'Who's Who in One Health'.
- **'Create'** opportunities for human, animal, plant and ecosystem health-related disciplines and institutions to work together in transformative collaborations .
- **'Educate'** the public about the importance of and urgent need for the One Health approach. This includes established professionals and students from all disciplines (from Anthropology to Architectural Design to Biology/Chemistry to Food Scientists to Medicine to Psychology to Sociology to Zoology, etc), agricultural and food production sectors, health care providers from human and animal domains, policy and law makers, 'everyone'.
  - (See Online One Health Library and Webinars led by or supported by the Commission and its Action Teams)
  - Preparing the Next Generation of One Health leaders and professionals by supporting Students for One Health and facilitating their efforts to further the One Health paradigm shift. (See Students for One Health webpage)

Donor / Sponsor opportunities are available for non-profit organizations (Institutions), corporations, and individuals who would like to help further the One Health paradigm shift.

The Commission is headquartered in the Research Triangle Park region of central North Carolina at

P.O. Box 972, Apex, NC 27502,

Telephone: 984-500-8093

Tara O'Toole

Wikipedia Tara O'Toole

Born -

Father -

Mother - Jeanne (Whalen) O'Toole

Tara O'Toole, MD, MPH - Professional Biography (from 2006 Infectious Diseases Conference)

Source - [HI000E][GDrive]

Dr. O'Toole is the CEO and Director of the Center for Biosecurity , and a Professor of Medicine and of Public Health at the University of Pittsburgh. The Center for Biosecurity is an independent organization dedicated to improving the country's resilience to major biological threats.

Dr. O'Toole is internationally known for her work on biosecurity and on health and safety issues related to the U.S. nuclear weapons complex. Her publications in the biodefense field include articles on the response to anthrax, smallpox, and plague biological attacks; containment of contagious disease epidemics; biodefense research and development strategies; and hospital preparedness. She is a Coeditor-in-Chief of the journal *Biosecurity and Bioterrorism: Biodefense Strategy, Practice, and Science*. She was a principal author and producer of *Dark Winter*, an influential exercise conducted in June 2001 to alert national leaders to the dangers of bioterrorist attacks. She was also a principal writer and producer of *Atlantic Storm*, an international ministerial-level biosecurity exercise held in January 2005. Prior to founding the UPMC Center in 2003, Dr. O'Toole was one of the original members of the Johns Hopkins Center for Civilian Biodefense Strategies and served as its Director from 2001 to 2003.

She has served on numerous government and expert advisory committees dealing with biodefense, including panels of the Defense Science Board; the National Academy of Engineering Committee on Combating Terrorism; and the National Academy of Sciences Working Group on Biological Weapons. She served as the Chair of the Board of the Federation of American Scientists from 2006-07, and in 2006 she was appointed to the Board of the Google Foundation's International Networked System for Total Early Disease Detection (INSTEDD).

From 1993 to 1997, Dr. O'Toole served as the Assistant Secretary of Energy for Environment Safety and Health. In this position, she was principal advisor to the Secretary of Energy on environmental protection and on the health and safety of the approximately 100,000 workers in the U.S. nuclear weapons complex and Department of Energy (DOE) laboratories. She developed the first overall management and safety plan for dealing with the highly enriched uranium, plutonium, spent fuel, and radioactive waste left in place when nuclear weapons production was stopped in the early 1990s. She ran the multi-agency, multimillion dollar task force that oversaw the government's investigations into human radiation experiments conducted during the Cold War. And she led the U.S. delegation to Russia to establish the U.S./Russia cooperative effort to study radiation exposure and environmental hazards of the Russian nuclear weapons complex.

Prior to her work at DOE, Dr. O'Toole was a Senior Analyst at the Congressional Office of Technology Assessment (OTA), where she directed studies of the health impact of pollution resulting from nuclear weapons production, among other projects. She also served as a consultant to industry and government in matters related to occupational and environmental health, worker participation in workplace safety protection, and organizational change. Dr. O'Toole practiced general internal medicine in community health centers in Baltimore from 1984 to 1988. She is board certified in Internal Medicine and in Occupational and Environmental Health.

She has a Bachelor's degree from Vassar College, an MD from the George Washington University, and a Master of Public Health degree from Johns Hopkins University. She completed Internal Medicine Residency training at Yale and a Fellowship in Occupational and Environmental Medicine at Johns Hopkins University.

Wired Magazine, 2009 : DHS' New Chief Geek is a Bioterror 'Disaster,' Critics Charge

Source - [HP002B][GDrive] -

Depending on who you ask, the Obama administration's controversial pick to be the Department of Homeland Security's geek-in-chief is either a leading authority on the deadliest terror threats – or a biowar chicken little, dangerously out of touch with reality.

At first glance, Dr. Tara O'Toole is a dream candidate to take over the position of DHS under secretary for science and technology. She's a doctor, the CEO of the University of Pittburgh's Center for Biosecurity, the former chairwoman of the Federation of American Scientists, and the brains behind a series of influential disaster response exercises that woke Washington up to the threat of terrorists with weapons of massive destruction. Who better to take over DHS' nearly billion-dollar research portfolio – about 45 percent of which goes towards chemical and biological defense?

But the outcry over O'Toole's nomination began just moments after the White House announced its intent late Tuesday to name her to the job. To her critics, O'Toole has dangerously overhyped the bioterror threat – leading to a huge increase of the number of research labs and researchers handling deadly agents. Ironically, it's these very facilities that are now these most likely sources for a deadly outbreak or bioattack; the 2001 anthrax strikes, for instance, were an inside job.

"This is a disastrous nomination. O'Toole supported every flawed decision and counterproductive policy on biodefense, biosafety, and biosecurity during the Bush Administration," Rutgers University microbiologist and homeland security policy critic Richard Ebright tells Danger Room. "O'Toole is as out of touch with reality, and as paranoiac, as former Vice President Cheney. It would be hard to think of a person less well suited for the position."

"She was the single most extreme person, either in or out of government, advocating for a massive biodefense expansion and relaxation of provisions for safety and security," he adds. "She makes Dr. Strangelove look sane."

O'Toole rose to prominence in biodefense circles after producing *Dark Winter*, a June 2001 exercise that explored how a single smallpox outbreak could threaten millions of lives in 15 countries. An Army War College report later found that the exercise tripled the normal transmission rate for smallpox – "mak[ing] it next to impossible for the game players to do very much to contain the outbreak, and assur[ing] a disastrous outcome irrespective of whatever control measures the players may attempt to carry out." *Atlantic Storm*, a 2005 exercise also produced by O'Toole, had similar issues. According to the report, it made "grossly misleading assumptions" about the ease of creation and dispersion of the same biological agent – assuming bioterrorists would enjoy a capability that neither the Americans nor Soviets could achieve at the heights of the Cold War.

To George Smith, a protein chemist and senior fellow at GlobalSecurity.org, these exercsies show O'Toole to be "the top academic/salesperson for the coming of apocalyptic bioterrorism which has never quite arrived. [She's] most prominent for always lobbying for more money for biodefense, conducting tabletop exercises on bioterrorism for easily overawed public officials, exercises tweaked to be horrifying. [And she] has never obviously appeared to examine what current terrorist capabilities have been... in favor of extrapolating how easy it would be to launch bioterror attacks if one had potentially unlimited resources and scientific know-how."It's a "superb appointment if you're in the biodefense industry and interested in further opportunity and growth," he tells Danger Room. "Alternatively, a disaster if threat assessment and prevention ought to have some basis in reality." If confirmed, O'Toole would succeed the widely-respected Jay Cohen, a retired admiral.

Wikipedia - Tara O'Toole

Saved wiki - [HK001K][GDrive]

Tara O'Toole served as the Under Secretary of Homeland Security for Science and Technology from 2009 to 2013. She is currently a senior fellow and executive vice president at In-Q-Tel.[1]

Background

Prior to her confirmation as Under Secretary (November 4, 2009), O'Toole founded, and served as chief executive officer and director of, the Center for Biosecurity at the University of Pittsburgh Medical Center. Concurrently, she was a Professor of Medicine and of Public Health at the University of Pittsburgh. She stepped down from her position as Under Secretary on September 23, 2013

From 2006 to 2007, she chaired the board of the Federation of American Scientists. In 2006, she was appointed to the board of the Google Foundation's International Networked System for Total Early Disease Detection. From 2001 to 2003, she directed the Johns Hopkins Center for Civilian Biodefense Strategies. From 1993 to 1997, she served as the Assistant Secretary for Environment Safety and Health in the Department of Energy. From 1984 to 1988, she practiced general internal medicine in community health centers in Baltimore.

Disaster response exercises

O'Toole is best known for her disaster response exercises. She was a principal author and producer of Dark Winter (2001) and Atlantic Storm[2] (2005), both of which simulated a covert outbreak of smallpox in the United States. Many experts applauded these exercises for publicizing the country's surprising vulnerabilities, including a vaccine shortage.[3] Critics charged that these exercises exaggerated the bioterror threat, leading to an unnecessary increase in the number of research labs.[4]

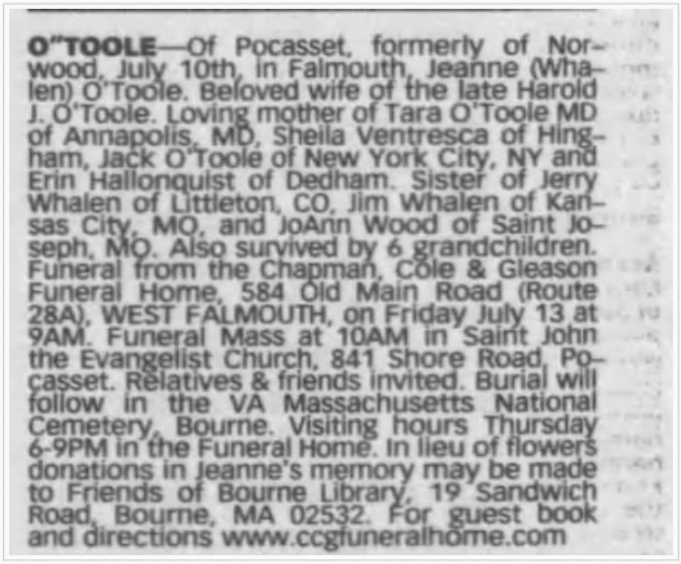
In her nomination hearing, O'Toole said that this controversy stemmed from her estimated "secondary transmission rate"; that is, the number of smallpox infections caused as a result of the initial infections. O'Toole claimed that her rate of 10 derived from "the available empirical data"[5] and coincided with data from a 2001 article in the peer-reviewed journal, *Nature*.[6]

Education

O'Toole holds a bachelor's degree from Vassar College, an MD from George Washington University, and a Master of Public Health degree from Johns Hopkins University.

Mother Jeanne (Whalen) O'Toole

Obituary for Jeanne OTOOLE



O"TOOLE—Of Pocasset, formerly of Norwood, July 10th, in Falmouth, Jeanne (Whalen) O'Toole. Beloved wife of the late Harold J. O'Toole. Loving mother of Tara O'Toole MD of Annapolis, MD, Sheila Ventresca of Hingham, Jack O'Toole of New York City, NY and Erin Hallonquist of Dedham. Sister of Jerry Whalen of Littleton, CO, Jim Whalen of Kansas City, MO, and JoAnn Wood of Saint Joseph, MO. Also survived by 6 grandchildren. Funeral from the Chapman, Cole & Gleason Funeral Home, 584 Old Main Road (Route 28A), WEST FALMOUTH, on Friday July 13 at 9AM. Funeral Mass at 10AM in Saint John the Evangelist Church, 841 Shore Road, Pocasset. Relatives & friends invited. Burial will follow in the VA Massachusetts National Cemetery, Bourne. Visiting hours Thursday 6-9PM in the Funeral Home. In lieu of flowers donations in Jeanne's memory may be made to Friends of Bourne Library, 19 Sandwich Road, Bourne, MA 02532. POCASSET - Harold Joseph O'Toole, 74, died Friday at Newton-Wellesley Hospital.

He was the husband of Jeanne W. (Whalen) O'Toole.

Born in Newton, Mr. O'Toole graduated from Newton High School and attended Northeastern University. In 1943, he joined the Arm served in World War II.

After marrying in Missouri in 1948, he returned to Newton. The couple later moved to Norwood, where they spent 25 years. In 1976, they moved to Pocasset.

Mr. O'Toole was a general agent for the Union Mutual Life Insurance Co. for more than 30 years. He won many awards in the insurance business and was a mentor to many business associates.

He was a member of Tahanto Yacht Club and the founder of the Peppy Parent Race series. An avid fisherman, he enjoyed an annual trip with his wife down the inter-coastal waterway to Florida and the Bahamas.

Surviving besides his wife are a son, Jack O'Toole of Boston three daughters, Erin Hallonquist of Dedham, **Tara O'Toole of Annapolis, Md.**, and Sheila Venteresca of Hingham two sisters, Elizabeth Hennessey of Needham and Mary Quigley of Burke, Va. a brother, Mortimer O'Toole of Winchester and six grandchildren.

A funeral Mass will be held at 10 a.m. Tuesday at St. John the Evangelist Church, Shore Road, Pocasset. Burial will be at the Massachusetts National Cemetery, Bourne.

Visiting hours are 6 to 8 p.m. tomorrow at Nickerson-Bourne Funeral Home, 40 MacArthur Blvd. (Route 28), Bourne.

Memorial donations may be made to Habitat for Humanity of Cape Cod, 121 Habitat St., Americus, GA 31709-3498.

Life and career

Carter Page was born in Minneapolis, Minnesota, on June 3, 1971,[6] the son of Allan Robert Page and Rachel (Greenstein) Page.[7][8] His father was from Galway, New York, and his mother was from Minneapolis.[9] His father was a manager and executive with the Central Hudson Gas & Electric Company.[10] Page was raised in Poughkeepsie, New York, and graduated from Poughkeepsie's Our Lady of Lourdes High School in 1989.[7]

Page graduated with a BS degree from the United States Naval Academy in 1993; he graduated with distinction (top 10% of his class) and was **chosen for the Navy's Trident Scholar program, which gives selected officers the opportunity for independent academic research and study**.[11][12][13] During his senior year at the Naval Academy, he worked in the office of Les Aspin as a researcher for the House Armed Services Committee.[14] **He served in the U.S. Navy for five years, including a tour in western Morocco as an intelligence officer for a United Nations peacekeeping mission, and attained the rank of lieutenant**.[14][15] In 1994, he completed an MA degree in National Security Studies at Georgetown University.[14] After leaving active duty in 1998, Page was a member of the Navy's inactive reserve until 2004.[15]

Education and business

After leaving the Navy, Page completed a fellowship at the Council on Foreign Relations, and in 2001 he received an MBA degree from New York University.[11][16] In 2000, he began work as an investment banker with Merrill Lynch in the firm's London office, was a vice president in the company's Moscow office,[3] and later served as COO for Merrill Lynch's energy and power department in New York.[12] Page has stated that he worked on transactions involving Gazprom and other leading Russian energy companies. According to business people interviewed by *Politico* in 2016, Page's work in Moscow was at a subordinate level, and he himself remained largely unknown to decision-makers.[3]

After leaving Merrill Lynch in 2008, Page founded his own investment fund, Global Energy Capital, with partner James Richard and a former midlevel Gazprom executive, Sergei Yatsenko.[3][17] The fund operates out of a Manhattan co-working space shared with a booking agency for wedding bands, and as of late 2017, Page was the firm's sole employee.[2] Other businesspeople working in the Russian energy sector said in 2016 that the fund had yet to actually realize a project.[2][3]

Page received a PhD degree from SOAS, University of London in 2012, where he was supervised by Shirin Akiner.[2][11] His doctoral dissertation on the transition of Asian countries from communism to capitalism was rejected twice before ultimately being accepted by new examiners.[18] One of his original examiners later said Page "knew next to nothing" about the subject matter and was unfamiliar with "basic concepts" such as Marxism and state capitalism.[19] He sought unsuccessfully to publish his dissertation as a book; a reviewer described it as "very analytically confused, just throwing a lot of stuff out there without any real kind of argument."[2] Page blamed the rejection on anti-Russian and anti-American bias.[19] He later ran an international affairs program at Bard College and taught a course on energy and politics at New York University.[20][21] In more recent years, he has written columns in *Global Policy Journal*, a publication of Durham University.[3]

2018-02-03-politico-com-why-carter-page-was-worth-watching.pdf

On Friday, Washington was convulsed by a contentious four-page document: the Nunes memo. The memo, according to its putative author, House Intelligence Committee Chairman Rep. Devin Nunes, revealed unprecedented abuses by the FBI and Justice Department. The counterview: That Nunes' memo was a misleading, partisan and shoddy piece of work. In this second reading, the purpose of the memo was to offer succor to President Donald Trump and to discredit the investigation into Trump, Russia and collusion led by special counsel Robert Mueller.

Most remarkable was the unlikely hero at the center of this national row: Carter Page. The memo alleged that the bureau bugged his

Most remarkable was the unlikely hero at the center of this national row, Carter Page. The memo alleged that the bureau bugged his communications after deliberately duping the Foreign Intelligence Surveillance Court. Not only that but using supposedly flawed material supplied by Christopher Steele, the former British intelligence officer whose dossier accused Trump of consorting with Russian president and former KGB operative Vladimir Putin. But who exactly was Carter Page? And were there, in fact, genuine reasons why the FBI might have ground for suspecting him?

To answer that question meaningfully it is necessary to go back—to 2013, and to a group of jaded Putin spies working deep undercover in downtown Manhattan. One of them was Viktor Podobnyy. Moscow had dispatched Podobnyy to the United States under his own name. He worked in New York under official "cover": attaché to Russia's delegation to the United Nations.

In reality, Podobnyy was employed by Russia's foreign intelligence service, the SVR. Putin was the former head of the SVR's domestic counterpart, the FSB. Podobnyy's mission was to recruit Americans and to collect economic intelligence. One of his SVR colleagues was Igor Sporyshev, who was working covertly as a "trade representative." Neither man was aware that the FBI had a bug inside their SVR office. The Bureau was secretly listening to their conversations.

One of their tasks was to liaise with another SVR officer, Evgeny Buryakov. Buryakov's position was somewhat precarious. He didn't have diplomatic immunity, which meant if he was caught he could go to jail. His official day job was at a branch of a Russian state bank in Manhattan, VEB.

As FBI wiretaps showed, the techniques for meeting with Buryakov were distinctly old-school. Typically, Sporyshev would ring Buryakov and tell him he had to give him "something"—a ticket, a book, a hat, an umbrella. The two would meet outdoors. This sometimes happened outside Buryakov's bank office on Third Avenue—an inconspicuous brown tower with a 1960s abstract sculpture at street level opposite the foyer. They would exchange documents.

ADVERTISING

Sporyshev's biggest headache was finding Americans willing to become intelligence sources for Russia. This was tough. He had approached two young women working in financial consultancy who had recently graduated from a New York university. Sporyshev told Podobnyy he was skeptical anything would come of it. Or, as he put it in chauvinist terms: "In order to be close you need to either fuck them or use other levers to execute my requests."

The Russian spies, however, had one promising lead. This was a guy—an energy consultant based in New York City. Unlike the women, he was eager to help. And, it appeared, keen to make money in Moscow. There was a drawback: The source—whom the FBI called "Male-1"—was something of a dimwit.

The FBI intercepts record:

PODOBNYY: [Male-1] wrote that he is sorry, he went to Moscow and forgot to check his inbox, but he wants to meet when he gets back. I think he is an idiot and forgot who I am. Plus he writes to me in Russian [to] practise the language. He flies to Moscow more often than I do. He got hooked on [the Russian state energy company] Gazprom, thinking that if they have a project, he could rise up. Maybe he can. I don't know, but it's obvious he wants to earn loads of money.

SPORYSHEV: Without a doubt.

Podobnyy explained he intended to string Male-1 along. That meant feeding him "empty promises." Podobnyy would play up his connections to Russia's trade delegation, to Sporyshev, and pretend his SVR colleague might "push contracts" the American's way.

PODOBNYY: This is intelligence method to cheat! How else to work with foreigners? You promise a favour for a favour. You get the documents from him and go tell him to fuck himself. But not to upset you I will take you to a restaurant and give you an expensive gift. You just need to sign for it. That is ideal working method.

These tactics may have been crude. In this instance they worked. Podobnyy approached the consultant at an energy symposium in New York. According to FBI court documents, the two swapped contacts. They emailed for several months. Male-1 co-operated, although he says he did not know the Russian was a spy. He even handed him documents about the energy world.

This was a strange business—Kremlin officers careening around Manhattan, spycraft involving fake umbrellas, and an American intelligence source who spent more time in Moscow than his Russian handlers. Plus espionage professionals who turned out to be suffering from ennui.

The American willing to provide information to Putin's foreign intelligence officers rented a working space at 590 Madison Avenue. The building was linked by a glass atrium to a well-known New York landmark, Trump Tower. The atrium had a pleasant courtyard, with bamboo trees, where you could sit and drink coffee. Next door was a franchise of Niketown.

From the atrium you could take the elevator up to the Trump Tower public garden on the fourth floor, with its sparrows and maple trees. The din from West 57th Street meant the garden wasn't exactly tranquil. Or you could queue up with Japanese and German tourists at the Trump Tower basement restaurant and salad bar. Failing that, there was Starbucks on the first floor.

Male-1 had a name. At this point few had heard of him. He was Carter Page.

***

Page is a balding figure in his mid-forties, with buzz-cut hair and the super-lean physique of a cyclist or fitness fanatic. When not on his Cannondale mountain bike, he is typically dressed in a suit and tie. When he is nervous, he grins. One person who met him around this period described the encounter as "excruciating." Page was "awkward" and "uncomfortable" and "broke into a sweat."

Page's résumé was curious, too. He spent five years in the navy and served as a Marine intelligence officer in the western Sahara. During his navy days, he spent lavishly and drove a black Mercedes, according to a friend from his academy class, Richard Guerin.

He was smart enough to get academic qualifications: fellow at the Council on Foreign Relations, master's from Georgetown University, a degree from New York University's business school. And a PhD from the School of Oriental and African Studies at the University of London.

This, it transpired, was hard won. Page's British academic supervisors failed his doctoral thesis twice, an unusual move. In a report they described his work as "verbose" and "vague". Page responded by angrily accusing his examiners of "anti-Russian bias".

Page's apparent Russian sympathies were evident from much earlier. In 1998 Page spent three months working for the Eurasia Group, a strategy consulting firm. Its founder, Ian Bremmer, later described Page as his "most wackadoodle alumnus." Page's vehemently pro-Kremlin views meant that "he wasn't a good fit," Bremmer said.

In 2004 Page moved to Moscow, where he became an energy consultant with Merrill Lynch. As Page tells it, it was while working as an investment banker that he struck up a relationship with Gazprom. He advised Gazprom on transactions, including a deal to buy a stake in an oil and gas eld near Sakhalin, the desolate island on Russia's Pacific coast. He bought Gazprom shares.

According to Politico, few people in Moscow's foreign business community knew of him. Those who did were underwhelmed. "He wasn't great and he wasn't terrible," his former boss, Sergei Aleksashenko, said, adding that Page was "without any special talents or accomplishments," "in no way exceptional," and "a gray spot."

Three years later, Page returned to New York and to his new office next to Trump Tower. From there he set up a private equity business, Global Energy Capital LLC. His partner was Russian—a wealthy former Gazprom manager called Sergei Yatsenko. Did Yatsenko know Podobnyy and Sporyshev? Or indeed other members of Russia's underground espionage community?

In the worsening dispute between Putin and the Obama administration, Page sided with Moscow. He was against US sanctions imposed by Obama on Russia in the wake of Crimea. In a blog post for Global Policy, an online journal, he wrote that Putin wasn't to blame for the 2014 Ukraine conflict. The White House's superior "smack-down" approach had "started the crisis in the first place," he wrote.

Page's rampant pro-Moscow views were at odds with the US State Department under Clinton and with almost all American scholars of Russia. After all, it was Putin who had smuggled tanks across the border into eastern Ukraine. Not that Page's opinions counted for much. Global Policy had a small circulation. It was edited out of Durham University in the north of England.

His relationship with the journal fizzled out when he wrote an opinion piece lavishly praising a pro-Russian candidate ahead of the U.S. presidential election—Trump.

And then something odd happened.

In March 2016 candidate Trump met with the Washington Post's editorial board. At this point it seemed likely that Trump would clinch the Republican nomination. Foreign affairs came up. Who were the candidate's foreign policy advisers? Trump read five names. The second was "Carter Page, PhD." Given Trump's obvious lack of experience of world affairs, this was a pivotal job.

One former Eurasia Group colleague said he was stunned when he discovered Page had mysteriously become one of Trump's foreign policy advisers. "I nearly dropped my coffee," he told me. The colleague added: "We had wanted people who could engage in critical analysis of what's going on. This is a guy who has no critical insight into the situation. He wasn't a smart person."

Page's real qualification for the role, it appeared, had little to do with his restless CV. What appeared to recommend him to Trump was his boundless enthusiasm for Putin and his corresponding loathing of Obama and Clinton. Page's view of the world was not unlike the Kremlin's. Boiled down: the United States' attempts to spread democracy had brought chaos and disaster.

Podobnyy and Sporyshev approached their duties with a certain cynicism laced with boredom and a shot of homesickness, the FBI tapes revealed. Page, by contrast, was the rarest of things: an American who apparently believed that Putin was wise and virtuous and kind.

By this point, the Russian spies had been spirited out of the United States. In 2015 their ring was broken up. As accredited diplomats, they were entitled to fly home. Buryakov was less fortunate. At the time that Page joined Trump's campaign, Buryakov pleaded guilty to acting as an unregistered foreign agent. He got two and a half years in a US jail.

In July 2016 Page went back to Russia, in a trip approved by the Trump campaign. There was keen interest. Page was someone who might give sharper definition to the candidate's views on future US–Russian relations. Moscow sources suggest that certain people in the Russian government arranged Page's visit. "We were told: 'Can you bring this guy over?'" one source said, speaking on condition of anonymity.

One of Russia's top private universities, the New Economics School, invited Page to give a public lecture. This was no ordinary event but the prestigious commencement address to its class of graduating students. The venue was Moscow's World Trade Center

Russia's media hailed Page as a "celebrated American economist." This, despite the fact that Page's lecture was distinctly strange—a content-free ramble verging on the bizarre. Page, it seemed, was criticizing U.-.S-led attempts at "regime change" in the former Soviet world. Nobody could be sure. His audience included students and local Trump fans, some of whom were visibly nodding off by the end.

Shaun Walker, the Guardian's Russia correspondent, had attended an event given by Page the previous evening. He described Page's PowerPoint presentation as "really weird." "It looked as if it had been done for a Kazakhstan gas conference," Walker said. "He was talking about the United States' attempts to spread democracy, and how disgraceful they were."

Page was Trump's leading Russia expert. And yet in the question-and-answer session it emerged that Page couldn't really understand or speak Russian. Those seeking answers on Trump's view of sanctions were disappointed. "I'm not here at all talking about my work outside of my academic endeavor," Page said. At the end, Walker said, Page was "spirited off."

Clearly, Page was reluctant to give any clues about a Trump administration's Russia policy or how Trump might succeed in strengthening ties where Obama and George W. Bush had both failed.

So what was he doing in Moscow?

***

According to the Steele dossier —vehemently disputed by Page and subsequently rubbished by Nunes, and Republicans —the real purpose of Page's trip was clandestine. He had come to meet with the Kremlin. And in particular with Igor Sechin. Sechin was a former spy and, more

importantly, someone who commanded Putin's absolute confidence. He was in effect Russia's second most powerful official, its de facto deputy leader.

By this point Sechin had been at Putin's side for more than three decades. He had begun his career in the KGB and served as a military translator in Mozambique. In the 1990s he worked with Putin in the mayor's offce in St Petersburg. Sechin functioned as Putin's scowling gatekeeper. He carried the boss's briefcase and lurked outside Putin's ground-floor office in St Petersburg's city hall.

His appearance was lugubrious. Sechin had a rubbery face, narrow-set eyes, and a boxer's squishy nose. When Putin was elected president, Sechin became his deputy chief of staff and, from 2004, executive chairman of the Russian state oil firm Rosneft, the country's biggest oil producer. A stint as deputy prime minister was not successful. "He's clever, despite looking like a dummy. But he can't speak or do public politics," Sergei Sokolov, deputy editor of the liberal Novaya Gazeta newspaper, said of Sechin.

In private Sechin impressed. Chris Barter—the former CEO of Goldman Sachs Moscow—described him as an "extremely charming and smart guy, on top of his numbers operationally." It was clear that Sechin had Russia's entire security services at his disposal. He would be willing to personally reward anyone who advanced the objectives of the Russian state, Barter added.

In 2014 Page had written a sycophantic piece that lauded Sechin for his "great accomplishments." In a blog for Global Policy, Page wrote that Sechin had done more to advance U..S.-Russian relations than anybody in decades. Sechin was a wronged Russian statesman, in Page's view, unfairly punished and sanctioned by the Obama White House.

This was the backdrop to Page's Moscow trip.

Eleven days after Page flew back from Russia to New York, Steele filed a memo to Fusion GPS, the business intelligence firm headed by former Wall Street Journal reporter Glenn Simpson. Simpson had initially begun investigating Trump and Russia at the behest of the Washington Free Beacon, a conservative website. Only later— once Trump had all but secured the nomination—did a law firm employed by the Democrats take over the Trump contract. The fact that Republicans opposed to Trump had begun the inquiry was nowhere to be found in Nunes' memo.

Dated July 19, 2016, Steele's field memorandum was titled: "Russia: Secret Kremlin meetings attended by Trump advisor Carter Page in Moscow."

Steele's information came from anonymous sources. In this case that was someone described as "close" to Sechin. Seemingly, there was a mole deep inside Rosneft—a person who discussed sensitive matters with other Russians. The mole may have been unaware its information was being telegraphed to Steele.

In Moscow, Page had held two secret meetings, Steele wrote. The first was with Sechin. It's unclear where this meeting, if it happened, took place. The second was with Igor Diveykin, a senior official from Putin's presidential administration and its internal political department.

Based on his own Moscow experience, Barter said that meetings with Sechin came about at short notice. Typically, Sechin's chief of staff would call up and order a meeting forty minutes later. "It was always off the cuff, last minute. It was, boom: 'Can you come now?'" Barter said. He personally met with Sechin six times, he added.

Sometimes these meetings took place in the White House, the Russian seat of government. On other occasions they were in Rosneft's tower HQ, overlooking the Moskva River. Of the Steele dossier, Barter told me: "Everything is believable."

According to Steele, Sechin raised with Page the Kremlin's desire for the United States to lift sanctions on Russia. This was Moscow's strategic priority. Sechin offered the outlines of a deal. If a future Trump administration dropped "Ukraine-related sanctions," there could be an "associated move" in the area of "bilateral energy co-operation." In other words, lucrative contracts for U.S. energy firms. Page's reaction to this offer was positive, Steele wrote, adding that Page was "generally non-committal in response."

Steele obtained further information from his high-placed source, which said that the Sechin meeting had taken place on either July 7 or 8—the same day as or the day after Page's graduate lecture.

According to an "associate," Sechin was so keen to lift personal and corporate Western sanctions that he offered Page an unusual bribe. This was "the brokerage of up to a 19 per cent (privatized) stake in Rosneft in return." In other words, a chunk of Rosneft was being sold off.

No sums were mentioned. But a privatization on this scale would be the biggest in Russia for years. Any brokerage fee would be substantial, in the region of tens and possibly hundreds of millions of dollars. Page "expressed interest" and confirmed that were Trump to become US president, "then sanctions on Russia would be lifted," Steele wrote.

Sechin's offer was the carrot.

There was also a stick.

The stick was flourished during Page's alleged second meeting, with Diveykin. The official reportedly told Page that the Kremlin had assembled a dossier of compromising materal on Clinton. And might possibly give it to Trump's campaign. However, according to Steele, Diveykin also delivered an ominous warning. He hinted—or even "indicated more strongly"—that the Russian leadership had damaging material on Trump, too. Trump "should bear this in mind" in his dealings with Moscow, Diveykin said.

This was blackmail, clear and simple.

Page was the go-between meant to relay this blunt message to Trump. He was part of a chain of cultivation and conspiracy that stretched from Moscow to Fifth Avenue. Allegedly, that is. Over the coming months, Page would vehemently deny any wrongdoing. He would assert that he was a victim. He said he didn't meet Sechin.

However, in testimony to Nunes' House Intelligence committee last November Page admitted meeting Andrey Baranov, Rosneft's head of investor relations. Did sanctions come up? "Not directly," Page replied. Did Baranov talk about privatization? He "may briefly have mentioned it," Page admitted. Was Baranov relaying Sechin's wishes? Almost certainly.

Page's problem, then, was that he had an unfortunate habit of seeking out Russian spies—ones in their twenties like Podobnyy and older ones like Sechin, either directly or via underlings. And Russian ambassadors like Sergei Kislyak, whom Page met in summer 2016 at the Republican

national convention.

***

Page's multiple interactions with senior Russians were a matter of growing concern to US intelligence. In the coming months, the FBI seemed to grow suspicious that Page might be a Russian agent. That summer the bureau decided it was going to bug Page's phone calls. This was no easy matter. To do this lawfully, federal agents had to obtain a warrant. Any application of this kind was voluminous—as then FBI Director James Comey put it, these were often thicker than his wrists.

The application included Page's earlier testimony to the FBI. In June 2013 counter-intelligence agent Gregory Monaghan interviewed Page in connection with the Podobnyy–SVR spy ring. Page said he'd done nothing wrong. Since then, Page had held further meetings with Russian operatives that had not been publicly disclosed, the application said.

Click to buy the book. New Window

Click to buy the book.

The FBI presented its evidence before a secret tribunal— the Foreign Intelligence Surveillance, or FISA, court, which handles sensitive national security cases. The bureau argued that there were strong grounds to believe that Page was acting as a Russian agent. The judge agreed. From this point on, the FBI was able to access Page's electronic communications. An initial ninety-day warrant was later renewed.

As the Wall Street Journal reported on Friday, Steele's research formed only part of the application. Four separate federal judges approved these renewals. All were appointed by Republican presidents.

Meanwhile, Page's career as a Trump adviser was entering its terminal phase. His speech in Moscow had provoked comment, much of it adverse. The campaign's ties with Russia were becoming a source of controversy. According to the Washington Post, quoting a campaign manager, Page wrote policy memos and attended three dinners in Washington for Trump's foreign advisory team. He sat in on meetings with Trump. Apparently, his attempts to meet Trump personally failed.

In the classified briefing to congressional leaders in late August 2016 Page's name figured prominently. The CIA and FBI were sifting through a mound of intercept material featuring Page, much of it "Russians talking to Russians," according to one former National Security Council member. When Senate minority leader Harry Reid wrote to Comey in early autumn, he cited "disturbing" contacts between a Trump adviser and "high-ranking sanctioned individuals." That was Page. And Sechin.

These embarrassing details surfaced in a report by Yahoo! News. Within hours, the Trump campaign had disavowed Page—casting him out as a nobody who had exaggerated his links to Trump. All of which made his subsequent rehabilitation by Nunes more bizarre. Page exited the campaign in late September. It was an inglorious end, and his troubles were just beginning. Steele's Rosneft source was right. In early December—less than a month after Trump won the White House—Rosneft announced it was selling 19.5 percent of its stock. This was one of the biggest privatizations since the 1990s and, on the face of it, a vote of confidence in the Russian economy.

Steele's mole had known about the plan months before Rosneft's management board was informed. The board only discovered the deal on December 7, hours after Sechin had already recorded his TV meeting with Putin revealing it. Even the Russian cabinet had been kept in the dark. "Sechin did it all on his own—the government did not take part in this," one source told Reuters.

In the weeks to come, US and other Western intelligence agencies would examine this deal closely. Where did the money go? Russian journalists were sceptical that it had ended up with Trump; it was more probable, they reasoned, that it would have travelled to Putin and Sechin. There was no proof of this, and neither the Kremlin nor other parties would offer comment.

A day after the Rosneft deal was unveiled, Page flew back to Moscow. During his previous July visit he'd been feted. Since then, however, Page had become a liability to the Trump campaign—and therefore to Russia, too. This time Page was an unperson, a toxic figure, at least officially. Dmitry Peskov, Putin's press spokesman, said government leaders had no plans to meet with him.

Page's own explanation for his visit was vague. He had come to see "business leaders and thought leaders," he told RIA Novosti, the Russian state news agency. He would be in Moscow for six days, he said.

In the months to come, Page would vehemently deny the allegations against him. He portrayed himself as a "peace-seeker." He even expressed sympathy for Podobnyy, the spy— whom he described as a "junior Russian diplomat." In an email to the Guardian, Page complained that Obama had persecuted Podobnyy, Sporyshev, and him "in accordance with Cold War traditions."

He wrote: "The time has come to break out of this Cold War mentality and start focusing on real threats, rather than obsolete and imagined bogeymen in Russia."

Page's loyalty to the SVR was breathtaking. Podobnyy wasn't an "imagined bogeyman" but a career operative working against the interests of the United States. And, moreover, one who had bad-mouthed Page behind his back, calling him "a bit of an idiot".

Whatever Page's motives were for helping Russian intelligence—greed, naivety, stupidity—his actions surely justified the FBI's interest in him. There was a simple way of avoiding U.S. surveillance and a FISA court warrant. It could be summed up like this: Don't hang out with Russian spies.

Andrusz said he had expected it would be "easy" to pass Page, a student at the School of Oriental and African Studies (Soas). He said it actually took "days and days" to wade through Page's work. Page "knew next to nothing" about social science and seemed "unfamiliar with basic concepts like Marxism or state capitalism," the professor said.

"September 20, 2018 : Trump's declassification will aid Eurasian Mafia (By Wayne Madsen)"

Carter Page may have been under U.S. intelligence surveillance for some time. A 1993 graduate of the U.S. Naval Academy, **Page was selected for the Navy's Trident Scholar program, which allowed him to avoid ship duty and enter directly into independent academic research and study. In his senior year at the academy, he was detailed to work in the House Armed Services Committee office of chairman Les Aspin. While in the Navy, he served as an intelligence officer for the United Nations Mission for the Referendum in Western Sahara (MINURSO), the peacekeeping force established to ensure an independence plebiscite for the people of Western Sahara, a former Spanish colony illegally occupied by Morocco**.

In 2000, Page became an investment officer at the Moscow office of Merrill Lynch. There, he became involved with major Russian energy firms owned by criminal syndicate-linked oligarchs, including Deripaska. After leaving Moscow for New York, Page established his own firm Global Energy Capital, with the assistance of Gazprom executive Sergei Yatsenko. However, Page's involvement with Russian energy companies may have begun earlier.

Little is known about Page's "intelligence" work for MINURSO in Western Sahara, Morocco, and the camps of the Western Saharan POLISARIO government-in-exile in Algeria. However, Western Sahara and its border region with Algeria is known to be rich in natural gas resources, something that would be of great interest to the Russian natural gas giant Gazprom. Russia's interest in the region was capped in 2001 by the signing of a strategic partnership between Russia and Algeria.

Preparing for a choice

The United Nations Mission for the Referendum in Western Sahara (MINURSO) was established by Security Council resolution 690 of 29 April 1991 in accordance with settlement proposals accepted on 30 August 1988 by Morocco and the Frente Popular para la Liberación de Saguia el-Hamra y de Río de Oro (Frente POLISARIO).

The settlement plan, as approved by the Security Council, provided for a transitional period for the preparation of a referendum in which the people of Western Sahara would choose between independence and integration with Morocco. The Special Representative of the Secretary-General was to have sole and exclusive responsibility over matters relating to the referendum and was to be assisted in his tasks by an integrated group of civilian, military and civilian police personnel, to be known as the United Nations Mission for the Referendum in Western Sahara.

On 29 April 2016, the Security Council adopted resolution 2285, calling upon the parties to the conflict to continue to show political will in order to enter into a more intensive and substantive phase of negotiations.

Chair of the President's Intelligence Advisory Board

In office

May 26, 1994 – May 21, 1995

President Bill Clinton

Carter Page, if he served with the House Armed Services Committee in his senior year at the Naval academy, and he graduated in 1993, that would be servicing in 1992-1993 .

https://www.mcclatchydc.com/news/politics-government/white-house/article144722444.html

"At the Naval Academy, Page was a Trident Scholar, a prestigious designation that allowed him to serve as a researcher his senior year on the House Armed Services Committee. The scholarship put him in the office of Rep. Les Aspin, D-Wis., shortly before the congressman became Clinton's defense secretary. Page also said he had served multiple tours in the Middle East and Europe as a surface warfare officer, and that he had later worked in the Pentagon on nuclear nonproliferation matters.

About Us

Allan R. Page founded A. Page & Associates, LLC, after a 32-year career with the CH Energy Group. During his career, Mr. Page worked in customer service, engineering, direct supervision, district and division level operating management. Mr. Page held executive and board level positions including membership on affiliate boards and the position of Group President. For many affiliates, Mr. Page served as COO and CEO. Mr. Page has been directly responsible for developing new business ventures such as electric generation companies, energy services companies, retail energy supply businesses (gas, electric, oil, propane) and energy trading organizations.

Mr. Page has extensive experience in business analysis, building teams, managing people, and organizational development. In his graduate work in Industrial Administration, he was fascinated by the study of human motivation, and has devoted much of his career to understanding and applying the practical aspects of motivating and developing people, teams, and organizations. He has extensive experience in settling union grievances and in negotiating union contracts.

Since its founding in 2002, A. Page & Associates has provided consulting, advisory, and development services for local and state governments, colleges, banks, engineering consultants, utilities, energy services companies, and manufacturers. We work with clients throughout the United States, the Dominican Republic, the Bahamas, Africa, Great Britain, the UAE, China, India and Russia.

Mr. Page serves

on a number of Boards

including:

Gilman Ciocia

Hudson Valley Board

of the Boy Scouts

of America

Cunneen-Hackett

Hudson Valley Board

of the World Affairs Council

Past Chairman of

MetroPool

Chairman and co-founder

of The Hudson Renewable

Energy Institute

Mr. Page has engineering degrees and a master's in Industrial Administration from Union College in Schenectady, New York. Mr. Page graduated from executive programs in management at the Edison Electric Institute and at the University of Michigan. He is a licensed professional engineer in the State of New Yor

[1] The parents of #CarterPage (Allan R Page) married in 1970. it appears that only the grandmother "Dr. Joan page" showed, and not the grandfather (sick? missing?). The "John Page"... is this an uncle of Carter Page?

Miss Greenstein weds Mr. Page

Rachel Elizabeth Greenstein and Allan Robert Page were married June 20 in Church of St. Philip.

Attendants were Dr. Joan Page, Mrs. Jeffrey Piehler, Ann Kruk, Joline Gitis, Roger Miller, Larry Greenstein, John Page, John Ellerton and Larry Giamicheal.

The bride is the daughter of Mr. and Mrs. Joseph Greenstein, 2741 Upton Av. N. Mr. Greenstein is alderman of the 5th Ward. The groom is the son of Mr. and Mrs. Andrew Page, Galway, N.Y.

After a wedding trip to Nova Scotia and Maine, the couple is at home in Kingston, N.Y.

The bride is a graduate of Skidmore College, Saratoga Springs, N.Y. The groom is a graduate of Union College, Schenectady, N.Y., and is a civil engineer.

Military service

Allegiance United States

Branch/service United States Army Air Corps

Rank Captain

Battles/wars World War II

Melvyn R. Paisley (October 9, 1924 – December 19, 2001) was appointed United States Assistant Secretary of the Navy (Research, Engineering and Systems) by President Ronald Reagan from 1981 to 1987.[2] He was prosecuted in Operation Ill Wind in which he, numerous other government employees and 60 private citizens were arrested.[3] In 1991, he admitted that while in office he had accepted hundreds of thousands of dollars of bribes and was sentenced to four years in prison.

Biography

Melvyn R. Paisley was born on October 9, 1924, in Portland, Oregon. He grew up in a logging camp where his father was a lumberjack and his mother was a cook. During World War II, Paisley enlisted in the United States Army Air Corps and became a distinguished pilot. He flew the P-47 Thunderbolt in the 9th Air Force, downed six enemy airplanes and was subsequently awarded the Distinguished Service Cross, two Silver Stars[1][4][5] and the Distinguished Flying Cross.[6]

After the war, Paisley studied engineering and received a bachelor's degree from the American Institute of Technology in 1953 and a master's degree from the Massachusetts Institute of Technology in 1954.

Career

In 1954, Paisley joined Boeing. His first job was working as an engineer on the CIM-10 Bomarc. In 1959, he became head of the electronics staff for the LGM-30 Minuteman, focused on the development of a radio launch system. In 1961, he became engineering manager of the Minuteman missile facility at Great Falls, Montana. He later headed Boeing's efforts on the Safeguard Program and later as electronics proposal manager for the B-1 Lancer. In 1971, he became head of Boeing's Evergreen 747 Supertanker program. Finally, he was promoted to the role of Boeing's Director of Planning.

Paisley was close to John Lehman. When Lehman became United States Secretary of the Navy in 1981, Lehman convinced President of the United States Ronald Reagan to nominate Paisley as Assistant Secretary of the Navy (Research, Engineering and Systems). He held this office from December 1981 until March 1987. Lehman and Paisley gained a reputation as being somewhat heavy-handed as managers, but effective at slashing red tape.

Operation Ill Wind

In 1986, federal prosecutors sued Paisley, arguing that a $183,000 severance package Paisley received upon leaving Boeing compromised his objectivity as Assistant Secretary of the Navy (Research, Engineering and Systems). The Supreme Court of the United States later ruled that such severance packages were not illegal.

Upon leaving government in 1987, Paisley worked as a consultant, guiding companies like Martin Marietta and United Technologies Corporation through the procurement process.

In 1991, federal prosecutors indicted Paisley for receiving bribes during his time as Assistant Secretary of the Navy (Research, Engineering and Systems). In the course of pleading guilty, Paisley admitted that he had received hundreds of thousands of dollars in bribes from an Israeli manufacturer of pilotless reconnaissance planes (Mazlat, which was a joint venture of two Israeli firms, Israel Aircraft Industries and Tadiran Ltd) and for providing confidential information to allow the Sperry Corporation to enable them to win a bid for the Aegis Combat System. Paisley was sentenced to four years in prison and fined $50,000.

Retirement

Paisley was released from prison in 1995. He spent the rest of his time painting and collecting World War II films. Shortly before his death, Paisley was a consultant for *Shooting War*, a two-hour documentary about World War II narrated by Tom Hanks.

Paisley died of cancer on December 19, 2001. He was buried in Arlington National Cemetery.[6]

1988 (June 27) - LA Times - "Scandal Figure Had Right Stuff : For Paisley, Shadows Overtook Hero Image"

Source : [HN01D7][GDrive] / By WILLIAM C. REMPEL AND DOUGLAS JEHL

WASHINGTON — In a corner of history far from the Pentagon fraud scandal that is now consuming his life, Melvyn R. Paisley was a hero--a World War II ace fighter pilot with a reputation for daring and a raft of medals to prove it.

Like every other fighter pilot of that time, the young Paisley lived by his wits and flew by the seat of his pants. In defense of his country he suffered permanent ear damage, but when the dogfights were over, Paisley was always the victor.

Friends call him “a survivor,” but Paisley was far more than that. His drive for success followed him into private life, where he rose to a prominent marketing position and helped win billions of dollars in military defense contracts for the Boeing Co.

And when Paisley reached the apex of his career, it was right back where he started, in the military arena--appointed in 1981 to one of the most powerful jobs in the Pentagon, assistant secretary of the Navy.

Along the way, however, Paisley’s glow of success was shadowed by rumors and allegations, much of it, according to a wide range of sources, fostered by his own boastful accounts, of purported scandals ranging from paying bribes to putting prostitutes on his company expense accounts.

Earlier this month, those shadows overtook the hero’s reputation. What emerged was a portrait of a man who had a lot of the right stuff but who investigators suspect did not always do the right thing.

It was this side of Melvyn Paisley that has led to a federal investigation of what is being described as a central role in the expanding case involving widespread fraud in the Pentagon’s weapons procurement system, the worst scandal of its kind in Defense Department history. Paisley has been linked to a variety of allegations, including bribery and the misuse of classified documents--all of it on a grand scale.

“He’s never changed,” said one former colleague who knew him well. “Paisley’s a World War II fighter ace who never grew up.”

At the base of a basketball pole in the Kent, Wash., home where Paisley lived before moving to the nation’s capital, another moment in Paisley family history is preserved in concrete--an array of hand prints, circa 1975. Mel’s is next to then-wife Millie’s and those of the four children: Chip, Frank, Debbie and Beau.

Conflict, Tragedy

The little cement tableau suggests a successful family life for Paisley. But that image, too, is shadowed by conflict and tragedy spelled out in legal documents in the courts and the coroner’s office. He has been divorced twice, and another wife died in an accident.

Paisley’s current wife, the former Vicki Ann McKim, a Boeing computer consultant with whom sources say he had a lengthy affair while still married to Millie, has been linked to the Pentagon fraud scandal. Government sources told The Times last week that Vicki Paisley allegedly assisted her husband in copying classified documents smuggled from the Pentagon and that she had been paid up to $50,000 by a private defense consultant while Paisley was still overseeing Navy weapons procurement.

Paisley’s Boeing career gave every appearance of success.

He joined the company as an engineer in 1954 and worked on a number of projects, including the BOMARC and Minuteman missiles. Subsequently, he moved through a number of management jobs and in 1971 became the program manager of the 747 tanker project, a military program. By 1981 he was manager for international operations with the Space and Information Systems Division of Boeing Aerospace and vice president of Boeing International Corp.

Masked Controversy

But his impressive corporate resume did not reveal the controversy that marked his career.

His own colleagues accused him of bribing foreign military officials, bugging the offices of competitors and billing fees for prostitutes to the company on his expense accounts. At least two former Boeing executives had sought to get Paisley fired from his job 10 years ago because they were alarmed about his conduct, retired officials have said.

According to former Boeing executive James Durst, Paisley did “dirty business.” Boeing officials said they would not answer any questions about Paisley this weekend.

Paisley lived well during his tenure at Boeing. There were European vacations, ski trips to a condo in Sun Valley, tennis and season football tickets.

He hosted lavish company Christmas parties on the 13-acre Kent estate where he often kept a couple of head of cattle in a nearby corral. He sold the house late last year for $182,000, according to county records.

Yet the Paisleys were not ostentatious. He didn’t drive fancy cars. Friends called him “a pickup truck kinda guy.” He tinkered at converting a bus into a motor home in his back yard and served inexpensive beef ribs when colleagues were invited for dinner.

Served Guests 4-Star Meals

Paisley was generous, a back-slapper with an unlimited expense account for his guests’ four-star meals and nightclubs at the annual Paris Air Show, when Boeing would send 400 people.

"When Mel wants to turn on the charm, he can be the most charming, humorous, delightful guy you'd ever want to meet," retired Boeing executive and Air Force Col. Harlan Wilder said. "But he could turn it on and off like a switch.

"When he set out to do the job, if he couldn't do it one way, he'd do it another," Wilder added. "But, by God, he got the job done."

Wilder, who directed Boeing's international government sales for the Pacific and the Far East, said Paisley's "brassy" style sometimes irked his colleagues.

Another colleague, Orvil M. Roetman, now vice president of government and international affairs for Boeing Co., said he is "still surprised" that Paisley got his high Pentagon post, given his flamboyant personality.

"Since I'm retired Navy, you tend to put the top Pentagon guys on a pedestal," he said. "Mel wasn't a guy you put on a pedestal."

It was late in his Boeing career that Paisley's friendship with former Navy Secretary John F. Lehman Jr. flourished. Paisley hired Lehman as a Boeing consultant, worked closely with him and had him over to the house a number of times. When Paisley "started angling for the Pentagon job," he went fishing with Lehman, recalls Paisley's ex-wife, Mildred McGetrick.

Start of New Career

He got the job. It was the beginning of a new career for Paisley.

At his confirmation hearing before the Senate Armed Services Committee, he quoted George Washington when asked why he wanted the job as assistant secretary of the Navy:

"Every citizen who enjoys the protection of a free government, owes not only a portion of his property, but even of his personal service to the defense of it."

A photograph of Paisley taken in September, 1986, provides a telling indication of the way the former fighter pilot plied his trade after getting his key job at the Pentagon.

He and his wife are standing, smiling, on the deck of the Queen Elizabeth 2, sailing home to the States after a visit to an air show in Farnborough, England.

Beside them, with his wife, is William M. Galvin, the defense consultant who investigators suspect was Paisley's conduit of valuable information to contractors in an arrangement that was central to the Pentagon fraud scheme.

The lavish cruise was but half of the foursome's joint voyage. On the way to England, said a former Pentagon official familiar with the trip, the Paisleys and the Galvins--Mel Paisley responsible for awarding Navy research contracts, Bill Galvin responsible for winning those contracts for his clients--had flown the supersonic Concorde.

Defense Industry Lore

Paisley's ties to Galvin had already become defense industry lore. "The understanding was that you want to see Paisley, you ask Bill Galvin," the former Pentagon official said. "He makes it happen."

That Galvin was a powerful influence on the assistant Navy secretary was also widely believed among Paisley's deputies. What few apparently knew was how tight the ties were. In the year of the Atlantic crossing, Vicki Paisley received the payment from VAMO, the company formed by the Galvins. About the same time, sources close to the investigation say, she was allegedly helping her husband copy Pentagon documents that, when passed on to a defense contractor, would provide an almost unbeatable advantage over its competitors.

Even before those allegations emerged, however, Paisley's expansive, free-wheeling style had kindled skepticism and distrust among some of his Pentagon colleagues. They say he inexplicably embellished what was already impressive, boasting that he shot down nine enemy aircraft when in fact he shot down five, and claiming to have won 16 air medals when in fact he won 12.

His colleagues said he lied about his academic record too, passing himself off as a graduate of the Massachusetts Institute of Technology, when in fact he received his degree from the unaccredited American Institute of Technology, and attended MIT only for a few months.

Enamored of His Style

But others, weary of bureaucratic caution, grew enamored of the fiery, blustery style of the man many refer to as the "the fighter pilot."

"He's colorful," said retired Marine Col. R. N. Patrick Jr. "He lives life as full as he can. . . . The whole time I worked for him, I never saw him do anything that wasn't to the benefit of the Navy and the Marine Corps."

"He was what that office needed," a former Paisley colleague said. "He took charge from the first."

Paisley's critics, however, had no patience for a broad-swath style that left little time for the details they thought important for a procurement chief to master. "There was no substance to him," said the former Paisley deputy, who told of preparing a slide presentation to brief his boss on a vital program only to find that Paisley fell asleep as soon as the lights were turned out.

"I could tell I was not getting through to him," the deputy said.

Others felt similarly powerless. At a secluded Navy base in the California desert, missile and bomb designers grew furious in the spring of 1986 at what they regarded as Paisley's capricious decision to force their boss to resign from his job as technical director of the China Lake Naval Weapons Center.

Appeal to No Avail

They appealed over Paisley's head, but to no avail. Finally, they resorted to donning buttons of protest: a circle with a red bar slashed diagonally across a paisley patterned background.

In international parlance, the message was clear: No Paisley. But, for the time being, the assistant secretary was to remain beyond challenge.

Paisley is still surrounded by symbols of the success he fashioned in business and government--a big house in exclusive McLean, Va.; matching Jaguar luxury cars in the garage, an office in the Watergate complex.

But by Sunday afternoon, two weeks after being implicated in the massive fraud scandal, Paisley's world was falling in on him.

His phone conversations, he learned, had been monitored for months. His dealings with contractors might have been videotaped. His offices in Washington and Virginia had been picked through by the FBI under search warrants seeking information that might tie him more closely to the allegations of corruption.

Having become a public target, Paisley had turned reclusive. He and his wife parked their matching Jaguars in the garage, renting a Chevy instead. But, for the most part, they have shuttered themselves in. When a reporter rang the doorbell, it went unanswered, though barbecue smoke could be seen wafting from the backyard. [...]

2016 (Nov 02) Blog - "National Security Violations, Murder Cover-Ups, Secret Families and Corruption"

Source - [HW005F][GDrive]

Much of the above comes from the **1995 book When the Pentagon Was For Sale by Andy Pasztor**, in which Ben features prominently.

https://archive.org/details/whenpentagonwasf00pasz/page/n5/mode/2up

[Ben Telfer Plymale (born 1926)] best friend was **Melvyn R. Paisley,** a colleague and fellow executive at Boeing. In the late 1960s, Melvyn lived on a farm in Kent, Washington and was married to his second wife, a younger woman named **Mary Lou** who enjoyed painting as a hobby. **Then on May 8, 1968, Mary Lou's dead body was discovered in their home in suspicious circumstances. She was found in the bathroom, lying face down and her head was surrounded by towels laced with carbon tetrachloride, a toxic cleaning fluid that she used to clean her paint brushes. The story that Melvyn gave was that she had gotten drunk and she took sleeping pills the night before and then accidentally asphyxiated herself with the cleaning fluid.** There was a police investigation and an investigation by the coroner. Her death was officially ruled an accident and the matter was officially dropped.

Despite the cause of death ruling, the matter was not dropped entirely; mostly because Mary Lou's sister didn't believe the official version of events. It became clear that there was more to the story, and the possibility of a cover-up and a murder became plausible. Twenty years later, when Melvyn was being investigated for separate corruption charges while working in the Pentagon, the case was reopened by King County. **It became clear that there were many inconsistencies and inaccuracies with the autopsy report, including the fact that the report found no traces of alcohol or sleeping pills in her system and the fact that the coroner who performed the report also worked for Boeing and somehow kept the report from review by his boss, the head coroner. There was also the revelation that not long before her death, Mary Lou had discovered or speculated that Melvyn was having an affair and had hired a private investigator to follow her husband. (Seven months later, Melvyn married the woman he was having an affair with.)**

Also damning was that – according to phone records – after Melvyn discovered his wife's body, the police was not the first number he called. The first number he called was his attorney and the second was his best friend, Ben Plymale. Then that morning, my grandfather's wife Susan went over to their house to clean it before the county authorities arrived. Susan apparently cleaned or threw away what the investigators assumed was vital evidence. That afternoon the investigators also noted that a fire was burning in the fireplace, which they remarked as unusual because it was May and not cold outside. The inference was that some evidence was probably incinerated in the fire.

Although the investigation was reopened in 1988, no additional charges were ever filed and Mary Lou's death still remains classified as an accident. However, given the circumstantial evidence, it is likely that there was more to the story. Was Mary Lou Paisley was murdered? If so, my grandfather and his wife were directly involved with covering up the crime. Interestingly, for decades after the fact, the case of Mary Lou Paisley was used an example by the King County Sheriff's Office as an example of how *not* to investigate a crime scene. [...]

Wolfgang Kurt Hermann Panofsky (born 1919)

Wikipedia Wolfgang K. H. Panofsky

Captured wikipedia article - [HK000O][GDrive]

Wolfgang Kurt Hermann "Pief" Panofsky (April 24, 1919 – September 24, 2007), was a German-American physicist who won many awards including the National Medal of Science.

Early life

Panofsky was the son of renowned Jewish art historian Erwin Panofsky in Berlin, Germany. He spent much of his early life in Hamburg, where his father was a Professor of Art History. At the age of 15, he moved with his family to the United States and entered Princeton University. He received his bachelor's degree from Princeton University in 1938 and earned his Ph.D. in physics from the California Institute of Technology in 1942. In April 1942 he was naturalized as a U.S. citizen.

Academic career

From 1945 to 1951, Panofsky held an assistant and then associate professorship at the University of California, Berkeley, before permanently establishing himself as Professor of Physics at Stanford University. **Between 1961 and 1984, he was the director of the Stanford Linear Accelerator Center** and continued to serve as director emeritus. He was also on the Board of Directors of the Arms Control Association from 1996 until 1999 and remained a director emeritus until his death.[*citation needed*]

Panofsky was a member of the Board of Sponsors of The Bulletin of the Atomic Scientists and won the Matteucci Medal in 1996 for his fundamental contributions to physics. He was also a recipient of the National Medal of Science, the Franklin Medal (1970), the Ernest O. Lawrence Medal, the Leo Szilard Award and the Enrico Fermi Award.

During his college days, Panofsky was called "Pief" by fellow students who found his full name unpronounceable. The childhood nickname seemed to suit the ebullient physicist, and it stayed with him throughout his long life. His elder brother, Hans A. Panofsky, was "an atmospheric scientist who taught at Pennsylvania State University for 30 years and who was credited with several advances in the study of meteorology". Their father, Erwin Panofsky, had been a "highly distinguished" professor at the Institute for Advanced Study, Princeton, New Jersey. In 1999, the new "Panofsky Lane", in that Institute's faculty housing complex, was named in Erwin Panofsky's honor.

Pathfire, Inc.

1997

https://www.bizjournals.com/atlanta/stories/1997/01/27/story2.html

Tom Engdahl is a rare bird in these parts, and he almost migrated to California.

The CEO of 8-week-old Video Networks Inc. is a veteran entrepreneur, with two successful start-ups on his resume. West Coast venture capitalists, who love backing a proven commodity, wanted to back VNI, but only if he relocated to his native California.

That didn't sit well with the locals here, not to mention Engdahl and his family, comfortably ensconced in Atlanta since 1983. So Engdahl and venture capitalist Stephen Fleming, with the help of several institutions, convinced the investors -- two prestigious West Coast venture funds -- through cajoling and cash that Atlanta could profitably house VNI.

Though his North Atlanta office has little furniture and personnel (the sign outside still reads "Commonwealth Insurance," the previous tenant), Engdahl has secured investments from Fleming's Atlanta-based Alliance Technology Ventures, as well as Institutional Venture Partners (IVP) and U.S. Venture Partners (USVP), both based in Palo Alto, Calif. Rosemont, Ill.-based Comdisco Inc., whose network VNI will use, also has an equity stake in the company. The total investment is worth about $4.3 million. VNI wants to transmit video digitally through an electronic infrastructure -- not a new idea, but one no one has successfully executed.

After Engdahl left Digital Video Inc. -- his second successful start-up -- in 1995, IVP general partner Geoff Yang offered him a slot as an "entrepreneur in residence" at IVP. Engdahl commuted between Atlanta and Palo Alto for a year, advising potential investors and researching his next opportunity.

11/14/2000 - Video Network, Inc. Closes $66 Million Financing Round,Announces Plans to Change Company Name to Pathfire

http://www.quadranglegroup.com/News/NewsItem.aspx?id=42

Key Strategic Investors Include Enron Broadband Services, Reuters and PanAmSat

New Pathfire Name Reflects Company's Pioneering Applications for Distribution and Management of Digital Media Across Numerous Industries

ATLANTA, GEORGIA, and NEW YORK, NEW YORK, November 14, 2000

Video Networks Inc. (VNI), a leading business-to-business provider of digitized video and related e-commerce applications for the media industry, announced today that it has closed on a $66 million round of private financing led by Quadrangle Group LLC, a private equity firm specializing in the media and communications industries.

Quadrangle's $20 million investment was the cornerstone of a round of financing that also included several key strategic and financial investors, such as Enron Broadband Services, a subsidiary of Enron Corp. (NYSE: ENE); Halpern Denny & Company; PanAmSat (NASDAQ: SPOT); Reuters; Riggs Capital Partners; and Sand Hill Capital. VNI said that it expects to announce business partnerships with several of its new strategic investors in the near future.

This round of financing included participation by existing high-quality VNI investors, such as Alliance Technology Ventures, AT&T Ventures, Bank of America Capital Investors, Institutional Venture Partners (IVP), Kinetic Ventures, Monarch Capital Partners, Noro-Moseley Partners, UPS Strategic Enterprise Fund and U.S. Venture Partners. Robertson Stephens functioned as VNI's agent for this significant round of financing.

Michael J. Eckert, president and CEO of VNI, said, "We are pleased and gratified that such a large number of blue-chip companies and firms have joined our existing investors in supporting VNI's vision and direction, and we are quite enthusiastic about the significant strategic value they bring. Our ability to secure a lead investor of Quadrangle's stature represents a strong vote of confidence in our employees, and of course in our groundbreaking technology. Through its deep relationships and high regard within the media and communication industries, Quadrangle will be a valuable partner as we continue to build this company."

Joshua L. Steiner, managing principal of Quadrangle, said, "We believe that VNI offers its customers superior service and significant cost-savings. The fact that leading media companies like NBC and Charter Communications rely on VNI for mission-critical solutions gives us great confidence in the company's prospects."

Steven Rattner, managing principal of Quadrangle, said, "Quadrangle's strategy is to focus on high-quality investments in the media and communications industries, and to invest in companies where we can make a difference. We are very excited about this company and its management team, and we look forward to helping VNI increase its product offerings and expand its customer base."

Quadrangle will receive one seat on the VNI Board of Directors and has the right to nominate a second board member, subject to the approval of the other shareholders in this round of financing.

VNI is a leading business-to-business provider of digital media content distribution and management services to the broadcasting and cable industries, with emerging operations in the areas of radio, digital cinema, syndication and streaming content on the Internet. VNI provides a distribution platform and software applications for the delivery and management of digitized video content and has developed unique e-commerce solutions that improve the efficiency of related billing and processing transactions. VNI's customers include major broadcast networks, cable companies, advertising agencies and other leading media companies.

Company to Change Name to "Pathfire," Reflecting Its Continuing Evolution

VNI's decision to change its name to Pathfire reflects a new stage of its development and its unique ability to distribute and manage digital media across numerous segments of the media industry.

The name is meant to evoke the speed and efficiency the company's leading-edge software applications and related networking capabilities bring to the management and exchange of digitized media assets in the cable, broadcast, media and entertainment industries. The company will officially adopt the Pathfire name and will launch an extensive rebranding campaign during the first quarter of 2001.

"We wanted a name that evoked the things we do as a company as well as the unique and dynamic way in which we do them," Eckert said. "Pathfire speaks to our ability to distribute content and also to our ability to surround that content with applications and services that make it more valuable."

Quadrangle Group LLC is an investment firm specializing in the media and communications industries. It was founded in March 2000 by four Managing Directors of Lazard Frères & Co. LLC who have more than 50 years of combined experience in private equity and in media and communications. The firm's advisory board and other investors include many prominent executives of leading media and communications companies.

DG FastChannel™ Completes Acquisition of Pathfire, Inc.

- Acquisition Further Diversifies DG FastChannel's Client Base and Revenues -

- Combined Entity to Realize Operational Synergies -

June 05, 2007 07:00 AM Eastern Daylight Time

DALLAS--(BUSINESS WIRE)--**DG FastChannel, Inc.** (NASDAQ: DGIT), the leading provider of digital media services to the advertising and broadcast industries, announced today that it has completed its previously announced acquisition of privately-held Pathfire, Inc., for $30 million. **DG FastChannel** financed the transaction with cash on hand and through borrowings under its existing credit facility.

Pathfire distributes third-party long-form content, primarily news and syndicated programming, through a proprietary server-based network via satellite and Internet channels. Pathfire is the primary distribution method for the majority of syndicated programming, including shows such as "Jeopardy," "Friends," and "Wheel of Fortune." In addition, ABC and CNN rely on the Pathfire network to distribute thousands of news stories to hundreds of television affiliates throughout the United States. Pathfire technology is installed in approximately 1,400 U.S. television stations.

Pathfire's digital media platform supports a suite of applications tailored to the needs of news, syndication, video news feeds and broadcasters. Pathfire software applications reside on over 10,000 desktops in virtually every U.S. television station. Like **DG FastChannel**, Pathfire delivers integrated digital solutions that automate media distribution and workflow management solutions enabling both content providers and broadcasters to maximize efficiency while reducing costs. The combined **DG FastChannel** and Pathfire networks provide a one-stop source for all video forms including ads, news, syndicated programming, movies and video news releases and electronic press kits. Scott K. Ginsburg, Chairman and CEO of **DG FastChannel**, and Omar Choucair, Chief Financial Officer of **DG FastChannel** will lead the combined operations.

About DG FastChannel, Inc.

DG FastChannel delivers the standard in digital media services to the advertising, broadcast and publishing industries. **DG FastChannel's** innovative technology solutions help advertisers and agencies work faster, smarter and more competitively.

Offering both the ubiquitous reach of multicast satellite transmissions and the targeted capabilities of Internet technologies, **DG FastChannel** has deployed a suite of business intelligence and asset management tools and creative and production resources designed specifically for the advertising community. **DG FastChannel's** next generation distribution platform includes high definition electronic video distribution capabilities that streamline the advertising process from point of ingest via digital distribution to its edge-servers located at TV, cable and network broadcasters. **DG FastChannel's** online media distribution network and suite of products and services are relied upon by more than 5,000 advertisers and agencies, and over 21,000 online radio, television, cable, network and print publishing destinations. **DG FastChannel** recently agreed to acquire the advertising distribution operations of Point.360 (NASDAQ: PTSX) with the transaction expected to be completed during the third quarter of 2007. For more information visit www.dgfastchannel.com.

About Pathfire (www.pathfire.com)

Pathfire, headquartered in Atlanta, is the leading provider of digital content distribution and management solutions for the broadcast, media and entertainment industries, supplying innovative digital solutions, from distribution to air, for broadcasters, news organizations, television networks, Hollywood studios and other media companies. Pathfire's Digital Media Gateway™ (DMG) is an advanced digital IP store-and-forward platform, delivering news stories, syndicated programming, advertising spots, and video news releases to more than 1,400 broadcasters. Pathfire DMG and the associated workflow tools are available on over 10,000 PC desktops throughout the world.

Launched

1994; 27 years ago

Current status

Closed in April 1999

(redirects to 'timeinc.com/brands')

Pathfinder was a landing page with links to various Time Inc. websites. In its initial form, Pathfinder was one of the first Internet portals, created as Time Warner's entry onto the Internet. The objective of Pathfinder was to be an all-encompassing site that brought the best content from all of Time Warner under one banner.

History[edit]

The site opened on October 24, 1994,[1] with a small content team led by James Kinsella, Bruce Judson, Craig Bromberg, Oliver Knowlton, and Curt Viebranz.[2] [3]The team grew rapidly to service a growing list of internal "content partners" - at its highest point, these "content partners" numbered 80. Most of these content partners were Time Inc. magazines such as Time, People, Fortune and others, but others came from the widely distributed Time Warner corporate empire.

Pathfinder.com was controversial within Time Warner. Many content partners were unhappy with the fact Pathfinder's existence prevented them from using their own URLs. For example, People Magazine was not allowed to use the domain "people.com," but was instead restricted to a directory on Pathfinder (pathfinder.com/people/). Pathfinder's own staff were shocked when Time Inc. senior manager Don Logan publicly derided Pathfinder.com at an external analyst's meeting as a "black hole" of unprofitability.

Pathfinder went through many managers and editors in its short life, and suffered from high staff turnover rates, especially after it became clear to many that its future was highly uncertain. Many early tech journalists and writers passed through its doors, including Walter Isaacson, James Kinsella (MSNBC), Daniel Okrent, John R. Quain (CBS News Up to the Minute and J-Q on Technology), John Voelcker (GreenCarReports.com), Josh Quittner, Lev Grossman, Maura Johnston and Steven Petrow.

The site was closed in April 1999, and was widely considered to be an expensive failure. Some claim that Pathfinder cost Time Inc. between $100 and $120 million.

Some analysts believe that Pathfinder's failure led Time Warner's senior managers to conclude that it was impossible to run a successful Internet portal, and this judgement led directly to Time Warner pursuing its eventual merger with AOL, a merger which unsuccessfully sought to generate "synergy" between the two corporate giants.

Pathfinder.com transitioned to a landing page, with links to Time Inc.'s other sites.[4]

__ AT A time when scores of top journalists are bailing out of traditional media and leaping on the digital train, WalterIsaacson is one of the few who can say, "Been there, done that." A Rhodes scholar, Isaacson established a career innewspapers before joining Time magazine in 1978, where he worked his way up to assistant managing editor. His well-received 1992 book Kissinger: A Biography was adapted for a cable-TV movie. In 1993, he left Time to become editor ofTime Warner's New Media business. That didn't last long. We caught up with Isaacson on his final Friday afternoon wayup on the executive's floor of the Time & Life building in New York. He was tossing out papers and other leftovers fromhis two-year New Media stint. Come Monday morning, he was to report 10 floors below as Time's new managing editor.__

Wired: You got a round-trip ticket to the world of digital media. Now that the trip's over, I'm guessing you're glad to begoing home.

Isaacson

: I'm not getting away from new media. Time has got to be on the forefront of the digital revolution.

Your Kissinger book shows a lot of personal style; it's written with a strong voice and a sharp point of view. But evensome of Time's writers have said the magazine muddies their point of view, kills opinions, and panders to the lowestcommon denominator. Lack of opinion and pandering do not win in the digital age. Do you aim to tackle these problemsas managing editor?

Time has to be a sharply intelligent magazine, with analysis and opinions based on common sense, not politicalprejudices. I'm in the process of hiring writers who have sharp voices and editors who know how to encourage analysis.Avoiding the muddle of group journalism is also a challenge. And it's going to be a high priority. I'm eliminating a layer ofediting. Most front-of-the-book news stories will now have just one editor.

As a journalist, how do you view the fact that Time Warner may be getting too big to be understood?

Now that I've moved to Time, I view Time Warner as a news story that I'm going to cover, not as a company I speak for.Time covered the Turner deal in a cold and sharp way. And its coverage of the Warner Music rap lyrics controversy wastough as well.

Is there a danger that Time Warner will treat you as just another business? Are you wary of media concentration in yourown back yard?

All media are becoming more diverse; and the Net assures that concentration is the least of all worries. There is nomonopoly on voice. And we at Time are very well shielded from interference from the business side of the company.Time is very healthy economically and journalistically.

What did you think of Time's coverage of the "porn on the Net" issue, where the magazine based a rather sensationalcover story on an erroneous study?

The method of the study was flawed and should have been put into better perspective.

What is the role of a general-interest weekly in a country glutted with news - one that will soon have up to four 24-hourcable news channels?

When Henry Luce invented the news magazine, his prospectus said: "At a time when people are being bombarded dailywith more and more headlines and more and more information, they are, ironically, becoming less informed." That's evenmore true in the digital age. When you're swamped with information and you have 1,000 different sources for each pieceof data, you look to certain brand names and a certain type of journalism you trust to make sense of it, to be yourintelligent agent, to sort it out.

What was the original vision behind Pathfinder, and is it succeeding?Pathf

Pathfinder began as an umbrella for a variety of Web services we wanted to create. In the end, what we have is just likePathfwhat's in any of the popular online services: a great package of material put together in a coherent way, with old and newbrand names. The big difference is that it happens to be on the Web rather than on some proprietary technology.

With 60 to 70 employees, is Pathfinder's cost structure too cumbersome for a start-up? Will there be a break-even pointPathfany time soon?

It's easy to see how these services will make money. Already, there are lots of advertising dollars. But I believe we notonly can but should create premium services that users will pay to use. If you are not creating a product users value, thenyou're not creating any value.

Let's talk about Time Warner's interactive TV service in Orlando. I went down there (see "People Are Supposed to Pay forThis Stuff?"Wired, 3.07) and concluded that people don't really want to interact with their TV in a meaningful way.

We're a content company at heart. It doesn't matter to me if the content is used on a TV, a PC, a toaster oven, or apersonal digital assistant.

Why did you take the New Media job in the first place?

The digital revolution offers the most exciting chall- enge to journalism since the invention of television. Because sincethen, everything has been broadcast. Now it's no longer mass media; it's personal.

What specifically are you doing to make sure that Time leads this digital revolution in journalism?

You'll see Time working on new projects that will provide daily, up-to-the-minute journalism using the Net as amechanism. On Pathfinder and in the news area on CompuServe, it won't be just the magazine dumped online everyPathfSunday night. You'll see Time Daily use wire feeds and news analysis from our reporters. We're hiring additional peopleto do that.

Isn't it true that paper, to journalists, is more prestigious than bits?

Online journalism is in its infancy. We started doing it at Time Warner three years ago. We started printing the magazine73 years ago. I assume it won't take another 70 years for digital journalism to have the same impact.

Homeland Security Digital Library

1997-06 - This document presents an overview of the President's Commission on Critical Infrastructure Protection. "The President's Commission on Critical Infrastructure Protection (PCCIP) was created by Executive Order 13010, signed by the President on July 15, 1996. The Executive Order originally stated that the Commission would terminate after one year; however, the order has since been amended to extend the life of the Commission by three months, to October 13, 1997. The Commission is therefore well along in its fifteen-month task of assessing physical and cyber threats to our vital infrastructures and developing policies and strategies to protect them. This overview briefing reports on the status of our work to those elements of the public and private sectors that have an interest in infrastructure assurance issues. We invite your participation as our work continues. Infrastructure protection is a broad subject of great complexity. At the outset we devised an approach to the task, and as work has progressed we have begun to form some general, preliminary impressions. Our outreach program has been extensive, but there are many knowledgeable sources we have not yet explored, and others yet to be discovered. We are by no means certain of our final findings and recommendations. What follows is intended to provide a sense of some of the issues we are exploring in the quest to find workable solutions to a serious problem."

President's Commission on Critical Infrastructure Protection

Robert T. Marsh

Chairman, PCCIP

"Tom" Marsh was the chairman of the President's Commission on Critical Infrastructure Protection. He was tasked with bringing together the combined forces of the government and private sector to advise and assist the President by developing a strategy for protecting and assuring the continued operation of this nation's critical infrastructures. These critical infrastructures include telecommunications, electrical power systems, gas and oil transportation and storage, banking and finance, transportation, water supply systems, emergency services (medical, police, fire, and rescue) and continuity of government services.

Quick Facts About Mr. Marsh

- **Born January 3, 1925 in Logansport, Indiana**
- **Graduated from the U.S. Military Academy, West Point, N.Y.**
- **Earned Master of Science degrees from the University of Michigan in Instrumentation Engineering and Aeronautical Engineering.**
- **First Chairman of Thiokol Corporation 1989-1991.**

Mr. Marsh has an extensive background as an aerospace consultant. He serves as the chairman of the Board of CAE Electronics, Inc. and Comverse Government Systems Corporation. He is a director of Teknowledge Corporation and a Trustee of the MITRE Corporation. He is also the director of the Air Force Aid Society. Mr. Marsh is a member of the Board of Visitors of the Carnegie-Mellon Software Engineering Institute and was chairman of the Board of Visitors of the U.S. Air Force Institute of Technology.

From 1989 to 1991 he served as the first chairman of Thiokol Corporation as it transitioned from Morton-Thiokol to separate company status. Mr. Marsh is a retired Air Force general. His last assignment was serving as the commander of the Air Force Systems Command, where he directed the research, development, testing and acquisition of aerospace systems for the Air Force.

With his vast experience in both commercial industry and the military, Mr. Marsh brings a unique understanding of both government and industry needs in the area of critical infrastructure protection to his position as Chairman of the Commission.

BY KEVIN POWERS / AUG 25, 1997

President Clinton has named Sam Nunn, the former Georgia U.S. senator, as co-chairman of the advisory team to the White House commission established to assess threats to the nation's computer infrastructure.

Clinton also appointed Charles R. Lee, chief executive officer of GTE Corp. of Stamford, Conn., David N. Campbell, president of BBN Technologies of Cambridge, Mass., and Elvin Moon, president of E.W. Moon Engineering & Construction Management Industries of Los Angeles, to serve on the team advising the President's Commission on Critical Infrastructure Protection (PCCIP).

Clinton created the PCCIP in July 1996 to identify and analyze cyberthreats to the nation's critical resources and systems, including the telecommunications infrastructure, banking systems and emergency services systems. The group is working with industry and government officials at the federal, state and local levels to evaluate diverse threats such as hackers, insider criminals and information warfare attacks.

Tom Marsh--a retired Air Force general and chairman of the board of CAE Electronics Inc. in Arlington, Va., and Comverse Government Systems Corp. in Woodbury, N.Y.--heads the PCCI. The commission's full-time federal members include representatives from the departments of Commerce, Defense, Energy, Justice, Transportation and Treasury, along with the FBI, CIA, National Security Agency and Federal Emergency Management Agency.

As the advisory committee co-chairman, Nunn joins Jamie Gorelick, former deputy attorney general, in leading the commission's private sector consulting team.

Some industry groups, such as the Computer and Communications Industry Association, have questioned whether the White House is using the commission to push its controversial key escrow encryption plan. But PCCIP officials said they will not prescribe any mandatory security policies or technical solutions.

Since his January appointment, Marsh has said in public speeches that the commission's primary challenge is to create a partnership with the private sector, heeding the technical advise from industry experts. Nunn and Gorelick are expected to represent industry's concerns about reinforcing privacy policies and limiting efforts to establish new federal security regulations on encryption products.

The commission's final product will be a set of policy, legislation and program recommendations for bolstering security in all essential infrastructure systems. The group has set up its own World Wide Web site at http://www.pccip.gov/pccip.

President's Message to Congress Calls for Computer Programs

President Lyndon B. Johnson's Message on Education and Health in America delivered to the Congress on February 28, 1967, called attention to the need for finding ways of developing the potential of the computer as it might be used for educational purposes. In his statement about computers in education he said:

> "In my 1968 Budget, I propose that the National Science Foundation be given new resources to advance man's knowledge and serve the nation. Its endeavors will help our scholars better to understand the atmosphere, exploit the ocean's riches, probe the behavior and the nature of man.
>
> "The Foundation will also step up its pioneer work to develop new teaching materials for our schools and colleges. The 'new math' and the 'new science' are only the first fruits of this innovative work.
>
> "One educational resource holds exciting promise for America's classrooms: the electronic computer. Computers are already at work in educational institutions, primarily to assist the most advanced research. The computer can serve other educational purposes -- if we find ways to employ it effectively and economically and if we develop practical courses to teach students how to use it.
>
> "I have directed the National Science Foundation working with the U.S. Office of Education to establish an experimental program for developing the potential of computers in education."

* *

Computer Instruction Project Planning Phase Completed

The Computer Instruction Project officially completed its tasks on February 1, 1967, after seven months of intensive activity and planning by dozens of teachers and administrators in six western Oregon counties. This planning project culminated in the preparation and submission of an operational proposal to establish a Computer Instruction NETWORK. At the operational level, this C. I. NETWORK will become the first of its kind in the nation. On the following pages is an excellent non - technical summary of the proposal as viewed by a teacher who participated in the planning phase.

Digitized by Google

[HG0063][GDrive]

WHAT IS THE C. I. NETWORK?

by

Mary Ann Sloan *

The Computer Instruction NETWORK is a proposal prepared under a planning grant from the U.S. Office of Education and it involves schools in the Mid-Willamette and Coast regions of Oregon. This proposal has been submitted to the U.S. Office of Education, and if it is approved, the project will get underway in the summer of 1967. Public and private secondary schools in Marion, Polk, Lincoln, Yamhill and portions of Clackamas and Linn counties would be participating as well as several state institution schools and one Federal (secondary) Indian School.

The objectives of the C. I. NETWORK are such that, following the learning experiences in computer concepts as proposed in the project, students should be able to:

1. Demonstrate through verbal and written responses, and through actual practice, a working knowledge of the importance and influence of computers on present society.
2. Demonstrate comprehension of basic computer concepts through actual operation of available equipment.
3. Demonstrate through actual problem-solving activities an increased facility in logical thinking.
4. Demonstrate an awareness of advanced computer technology through listing and describing some of these techniques.
5. Demonstrate an understanding of computer vocabulary through definition and use.
6. Demonstrate through verbal, written and working knowledge, an awareness of computer operation enabling him to make wise decisions concerning career opportunities in the computer area of technology.
7. Demonstrate through ability and skills a vocational potential in computer fields of employment.

Other objectives of the Project include:

1. Providing through computer instruction courses a demonstration of a means whereby potential dropouts, underachievers, and culturally deprived students can find motivation for training in saleable skills.

* Mrs. Sloan is a High School Office Occupations Teacher at Toledo High School, Toledo, Oregon. She was district representative from Lincoln County to the Computer Instruction Advisory Committee. Mrs. Sloan wrote this summary of the C. I. NETWORK at the request of Mr. Donald E. Egge, Assistant Superintendent of Lincoln County Schools who has given wide circulation to the information concerning the computer project.

Digitized by Google

[HG0064][GDrive]

If the proposal for the C. I. NETWORK is approved as submitted, the following would be available during the next school year to all participating schools in the area:

EQUIPMENT

1. Teletypes installed for a full school year in twenty-five schools.

   These will provide, over a Teletypewriter Exchange line, access to the three computer systems in the NETWORK, as well as communication between schools. They will also serve as off-line punch devices for preparation of program tapes.

2. Six small, portable computers for classroom instruction and hands-on student use.

   These computers have their own on-line Teletype and paper tape input-output, and will be rotated through the schools participating in the Project. Programming instruction will be in machine language and assembly language.

3. One IBM 1130 installed permanently in Mobile Computer Lab.

   This more sophisticated computer, which will use paper tape input-output, will allow instruction in machine language, assembly language, and FORTRAN. The Mobile Lab will be on the road, traveling from school to school, for the duration of the project. A computer specialist will travel with the Lab to give instruction and assistance.

4. Access, via TWX line, to a highly sophisticated GE 235 computer system in Phoenix, Arizona.

   This system, besides giving students experience in the concept of "time-sharing", will have three high-level languages available: BASIC, FORTRAN and ALGOL.

5. Time available on computers in some local businesses and colleges.

6. Four logic trainers.

   These will provide classroom instruction in computer logic and circuitry.

MATERIALS

1. Simulators for demonstration.
2. Films on computer history, theory, and operation.
3. Filmstrips with sound presentation.
4. Testing materials and information.
5. Materials for classroom units of various time durations.
6. Programs for computers.

CURRICULUM UNITS

Several possible units of computer instruction will be available. Project staff will provide all materials, services, and assistance requested, but it is hoped that individual schools and teachers will experiment

Digitized by Google

and develop their own units and courses of study. Some of the units of information available will include:

1. Demonstration (1 hour minimum) by Project staff specialists.
2. One-to-three week units incorporated in a business, math, or science course.
3. A one-month unit incorporated in an existing course.
4. A one-semester course--may be an elective or be incorporated in an existing course.
5. A one-year course.
6. The social studies curriculum planning group recommended a basic introductory unit in the eighth grade of all schools, and a unit in eleventh and/or twelfth grade expanding on the implications of automation.

IN-SERVICE

1. Two identical summer workshops for twenty teachers each time.

   These workshops will include instruction in basic computer concepts and special sessions for teachers in the areas of mathematics, science, business education, and social studies. This will include curriculum development by the participating teachers. They will develop units of work which can be integrated into their special fields.
   Stipends will be offered to the forty teachers at the rate of $75 per week plus $15 per dependent per week (2 dependents).

2. Beginning in-service during the school year.

   Courses with content similar to the summer workshops will be offered free of charge during the school year. It is expected that two courses will be available each term, for ten teachers each time.

CONSULTING STAFF

The consulting staff would consist of three people -- the director, a coordinator and a computer specialist. They would offer the following services:

1. Advising, and assisting teachers and administrators on technical matters, programming, operation, and methods of teaching.
2. Assisting teachers with classroom instruction.
3. Giving demonstrations for pupils, teachers and parents.
4. Teaching class for up to three weeks (where present teacher is not yet qualified).
5. Giving assistance to teachers on curriculum planning and evaluation.
6. Scheduling, delivering and picking up loan equipment and materials.

* * * \

exciting to contemplate. There are several fundamental avenues in computer education at present. One phase of computer education involves basic instruction in the use, function and operation of the computer. A second phase involves the business, scientific and technical applications of the computer. A third phase encompasses the technology of the computer, i.e., computer theory, electronics, circuitry, maintenance and repair. A fourth phase, computer assisted instruction, is by far the most complex and relatively unexplored.

Phase one, basic computer instruction in the use, function and operation of the computer, has been successfully introduced and experimented with in school districts such as Salem and Lake Oswego here in Oregon. Usually it has been under the care and cultivation of the mathematics department, and the instruction has been confined largely to students in senior and educationally advanced mathematics. However, computer education is a broad and inclusive term and the emphasis on phase one should shift to include students from all areas of the curriculum. A probable sequence of instruction would be a one-semester course designed to accomplish phase one as described above. The second semester, as now contemplated, would launch phase two, computer applications, which would involve activities where the student would use his basic knowledge of the computer to solve problems arising in areas of business education, industrial arts, science, mathematics, etc. The instruction in phase one and in parts of phase two would use small portable computers.

As students become more sophisticated and are ready to solve problems related to other areas of the curriculum large computers can be used. One possibility is the use of a teletypewriter exchange line TWX whereby the teletype is connected to a large central computer which can be as far distant as Phoenix, Arizona, or Los Angeles, California. Using a TWX line and a time shared computer, the computer can be rented for a given amount of on-line time. This system uses different computer languages such as FORTRAN, ALGOL, or BASIC, which is a combination of the best features of the first two.

Phase three, learning about the technology of the computer, will be an outgrowth of the industrial arts-science electronics program and would occur in the more advanced electronics courses. This would include instruction on computer theory, electronics, circuitry, maintenance and repair.

Phase four, computer assisted instruction C.A.I. is under going research in different parts of the county. The Portland Public Schools System is experimenting with C.A.I. in conjunction with the A.A.A.S. elementary science program. Dr. Suppes is experimenting with a symbolic logic course for first through sixth graders and Stanford University freshmen. Computer assisted instruction will ultimately aid the classroom teacher and the individual student by providing an immediate one-to-one response and feedback to the learner while maintaining a continuous up-to-date profile chart on such things as the learner's response time, skill development, and concept development. A teletype and video display placed in the home con make such instruction available to any member of the family at any time, or if placed in a public library available to the general public.

The future is exciting; the possibilities almost unlimited!

* Mr. Bell is a science and mathematics consultant, with the Salem Public Schools, Salem, Oregon. He has had extensive teaching and administrative experience at all levels from elementary through college. He is as much at home discussing the social implications of automation as he is in coping with the scientific and technological side.

PDP-8/S LATEST ADDITION AND "LITTLE GIANT" OF THE C.I. NETWORK

New Computer Makes Debut at C.I. Network

By BUD PEMBROKE

A new computer has been added to the ranks of those already available to the schools of the C. I. NETWORK. The rather nondescript name given to this newcomer is the PDP-8/S. The manufacturer, Digital Equipment Corporation, places the "S" on the end of the name to denote "slow". But don't let this fool you, it is slow only in relation to its big brother, the PDP-8. For most short programs written in high school, the students won't even have the pleasure of seeing the lights blink. The cycle time for the 4096-word ("4K") magnetic core memory is 8 microseconds. This means that this "little giant" will be doing somewhere between 10,000 and 100,000 operations per second.

ONLY 10-1/2 INCHES HIGH

"Little Giant" is an apt nickname for the PDP-8/S. This computer stands only 10-1/2 inches high, 19 inches wide, and 28 inches long. However, once again, we must be careful not to

The Staff of The C. I. Network

MRS. JUDY EDWARDS, Project Director, who has just completed a classroom guide for this portable computer, the ECP-18, is now in the process of planning curriculum guides and materials for each of the computers to be used in the C.I.NETWORK. Not only does she edit books, but she also writes script for, directs, and acts in a series of video tape recordings to be used in some high school classes this fall.

Video Tapes for Schools

Work is in progress at C.I.N. on the production of a series of 20-minute video tapes, each presenting a beginning concept of computers and programming. These tapes should be available to teachers in the fall. (With necessary equipment to play back the tapes in the classroom, if the school does not have such equipment.)

BUD PEMBROKE, Project Coordinator, in addition to writing programs (some of which work as you can see above), has been: scheduling the various computers for the coming school year, working on the video tapes for classroom use, and working with the teachers that have been coming in this summer.

DAVE GILLETTE, computer specialist, is getting accustomed to a van like the one which he will drive, as the mobile 1130 compute-lab is set up in December. Until that time, he will be helping with the portable computers, concentrating on the PDP-8/S.

Hippies, Heuristics, And Only Incidentally, Holes

By "NIC"

The recent rash of magazine articles devoted to the exploration of "The Hippie Mystique" has convinced me that if one is publishing even a newsletter, one must include an article about hippies. ("What does that have to do with computers?" I hear you say. Read on --- there's sure to be a connection!)

As food for thought, or grist for an argument, I propose that if hippies are a most disturbing form of social revolt, perhaps a disturbing change in society can be examined as a contributing factor.

Automation. No, not just automation, but computerization. The celebrated Professor S. I. Hayakawa of San Francisco State College, who led the losing campaign against digit-dialing in California, took a computer course last summer. Why? Because "it's like fighting the electric light. I don't want to find myself obsolete." Some are resigned to the inevitable defeat of personal identity, warmth, response to beauty, sensitivity, creativity, and human understanding, which they are sure suffer greatly from the increasing computerization of everyday life. And it does appear, whether or not computers are responsible, that humanism is on the decline. Human interaction does appear to be more and more replaced by machine interaction, or machine-human interaction.

Telecommunication, so vital in the emerging world of mass data storage and remote retrieval of information, ultimately means

(CONTINUED on Page 4)

DOROTHY SCOTT, our friendly secretary, is kept busy setting up appointments for the staff, with teachers who are anxious to complete their planning for the use of computer instruction in their classes this fall.

Computalk Policy

There are almost as many types of approaches to computer instruction within the project area of the C. I. NETWORK as there are schools involved. As a result, COMPUTALK plans to give its readers a chance to look at what some of the other schools are doing by featuring a different school each issue.

Computer Instruction Plans at Lake Oswego High

By CHUCK GELDAKER

I thought that I might share with the Computer Instruction NETWORK some of the plans which we at Lake Oswego High School are making for the coming year. We have had a unit on computers in our Intermediate Algebra classes for three years now and these students, even though they are not the best math students, have a tremendous amount of interest in computers. We feel that this instruction really gives them an advantage in developing a better understanding of what computers can and cannot do in our technological society. We will continue this phase of our computer instruction for the coming year. Last year, the students in Advanced Math were given a two-week unit on the computer and this will be continued also.

FULL-YEAR COURSE

A very exciting new part of our computer instruction is the full-year course called Computer Science. Although we had enrollment for two classes, we will have just one class this first year because of the experimental nature of the course. Computer Science will look at the computer from many viewpoints --- the mathematical, the technological, the cultural and the business aspects will be explored. Students in this class will get "hands on" experience on the ECP-18, and through the teletype to be installed at Lake Oswego, will get experience with the time-sharing aspect of computers. The students will be in the 10th or 11th grade, so they will be expected to apply their knowledge of computers to advantage in other courses in mathematics, science, business, etc., in the following years of their high school education.

The students in our advanced placement program learned to program the ECP-18 last year in Advanced Math class. They will use this knowledge whenever applicable in the study of the calculus.

We also intend to experiment with some of the slower students in mathematics in an effort to see what they can do in learning to write programs, etc. Since computers affect all of society, we feel that these students might also benefit from some instruction.

TEACHER IN-SERVICE

The last aspect of the computer instruction program will be an in-service course for the teachers in the district. This course will help teachers to understand the impact of computers of our society and will, in turn, help their students understand this tool which has and will continue to affect their lives in very dramatic ways. This class will be taught by a team (three teachers) from the high school and will be open to all teachers in our district. It will be a two-hour class for thirteen sessions. We hope that these teachers might be able to see how the knowledge of the

(CONTINUED on Page 6)

[HG006A][GDrive]

New Computer. . .

(CONTINUED from Page 1)

be misled by appearances. With a memory size of 4K it will not only be possible to program in a machine language, but also in high level compiler languages, such as BASIC and FORTRAN, and because of its small physical size the PDP-8/S can be easily carried right into the classroom. This computer, like all others in the C. I. NETWORK, will use a paper tape input-output.

YOU ADD TO SUBTRACT

Another interesting facet of this computer is that you do not have a "subtract" instruction as such. The PDP-8/S uses a two's complement arithmetic which means that subtraction is accomplished by adding the complement of a number. This might be best explained by taking an example in base ten. Suppose we agreed to use only the units place and any carry into the tens place is lost. This means that if we wish to subtract 3 from 9 we could do it in the conventional way:

$$\begin{array}{r} 9 \\ -3 \\ \hline 6 \end{array}$$

Or we could add the complement of 3, which is 7, to the 9:

$$\begin{array}{r} 9 \\ +7 \\ \hline 6 \end{array}$$

Because we did agree to ignore any carry into the 10's place, the result is the same. Of course the computer does not work in a one place base 10. It uses binary arithmetic with a twelve-bit word length. However, the principle is the same.

In the author's opinion, there are only two things that keep the PDP-8/S from being the ideal classroom computer. The first is the limit on the number of students that can conveniently see the lights on the registers. The second is that the PDP-8/S uses indirect addressing. This means that at times, two addresses or words must be used to refer to a third address in the memory. However, neither of these problems is insurmountable.

If the reception accorded the "Little Giant" by the staff of the C.I. NETWORK can be used as a guide, it looks as if the teachers and students of the project area may look forward to an enjoyable year with the PDP-8/S.

Lake Oswego School. . .

(From Page 3)

computer might be utilized in the subject that he teaches. We hope that teachers from every department in our school district will participate in this class.

340 STUDENTS TO USE COMPUTER

This past year, about 200 students learned to operate the ECP-18 with about 450 programs written. It is our hope that we can do even better than that this coming year. To summarize, the following chart will show the magnitude of our program for the '67-'68 school year.

Intermediate Algebra - 80 students for one month
Advanced Math - 85 students for two weeks
Computer Science - 28 students for one year
Calculus - 17 students for selected topics as needed.
Intermediate Math - 60 students for two to four weeks
Geometry - Algebra II - 45 students for two weeks
In-service Course - 25 teachers for one quarter
TOTAL 340 using five instructors

Hippies . . .

(From Page 3)

a decrease in personal communication as data communication becomes mechanical and automatic.

As these seemingly inevitable changes take place, great gaps --- holes --- are left in the fabric of society.

Perhaps hippies are using the heuristic approach to the problem. Heuristic is a beautiful word used in programming computers, "pertaining to exploratory methods of problem-solving in which solutions are discovered by evaluation of the progress toward the final result". (Like a computer program which requires that the computer LEARN to win at chess by actually playing the game and examining its opponent's plays.) The heuristic approach to a problem is one that encourages further investigation and experimentation.

Perhaps in the land of no watches and no walls, the Haight-Ashbury district, solutions are being experimented with.

How do human beings relate to each other in the new age of the automobile, the jet plane, the impersonal "national data bank"? How do they adjust to increased leisure, increased emphasis on intellectual rather than manipulative skills? Are there answers? Is anyone looking for them?

There seems to be another "hole" --- in computer instruction. At all levels, people are being trained to operate and program computers, provide them with data, make them increasingly sophisticated and increasingly able to assume more and more of man's duties. But does anyone look ahead ten or twenty years to the world today's teenagers will live in? Is anyone stimulating young minds to consider the human problems created by automation?

And there will be problems! More problems than we today can even conceive of existing. For instance, in the past, the rule --- rather than the exception --- has been for a man (like his father before him) to devote his life to one line of endeavor. This will no longer be true. Even now there are occupations that did not exist fifteen or twenty years ago.

What about privacy of information? Right now, today, by typing your name and driver license number on a terminal at the Department of Motor Vehicles, your complete driving record is displayed on a screen. What happens when not only your driving record is readily available but school, financial, social, vocational and political data is at a moment's call? Who do YOU feel should have access to such files --- files that in the past have been so spread out and so deeply buried that few people would bother even to try to find them. And, what emotional problems do YOU think this "Big-brother-is-watching-you" effect will have on today's youth?

If the Haight-Ashburyites are trying to tell us that something is wrong now, and if we don't change and really train for the future, what will they tell us about tomorrow? It seems to me that the only way we can help today's youth cope with tomorrow is to assist them in developing some personal strength of character and a belief in themselves. What do YOU think should be done, and how should WE do it?

Education to Prepare for Computer Age Urged

By CONRAD PRANGE
Staff Writer, The Statesman

The coming age of computers is not to be regarded as tragic, but America's failure to prepare her citizens for it can have disastrous results.

"We must instruct our high school age youngsters, who will be adults soon, how to cope with an electronic society and how to control it intelligently for man's good," Mrs. Judith Edwards told a conference of educators in Salem Wednesday.

To dramatize the effect computers may have on society soon she said it may be possible for the United Nations to predict the outcome of all future wars before they start. Computers also could help plan and predict costs and results in such major problems areas as crime prevention, air and water pollution, poverty and racial issues.

Mrs. Edwards is director of the Salem - based Computer Instruction Newtork, a federally financed project to acquaint mid - Willamette Valley high school students with the concept of computers.

She was the kickoff speaker at a two - day conference of about 250 Oregon high school teachers and administrators who are here to learn about computer instruction in schools.

"The experts are saying that the advent of computers is bringing a turning point in our history," she said. "So I think it behooves us to attempt to instruct students how these awesome machines can be controlled for the good of mankind and used intelligently and wisely."

Too many people, she said, now think of a computer mostly as a "black magic box with flashing lights that can do incredible things with tremendous speed, without really understanding its potential for good and evil."

She suggested that students not use computers only in their math classes as a problem solving machine, but that computers be worked into social studies programs.

"Students need to know not just how a computer works, but also the cncept of computer use in a new realm of social responsibility."

She said it was best if a school assigned a team of teachers to instruct students on computers. They should represent a cross-section of the curriculum.

Computers Studied Mrs. Dorothy Scott sits at console of computer on display at state conference of educators studying computer instruction in schools. Observing are Olen Morain (left), Portland, Hewlett-Packard Co. representative, and Bud R. Pembroke, project coordinator of computer instruction program. Mrs. Scott is program secretary. "CINET-BASIC'" = "Computer Instruction NETWORK - BASIC "

ABSTRACT

The presentation will cover the present use of the PDP-Sis as a portable computer in several curricular areas in schools within the Computer Instruction NETWORK. The use of machine language will be discussed along with the use of CINIC as a "Load and Go" conversational compiler. CINIC "Computer Instruction NETWORK Instructional Compiler" was patterned after a subset of BASIC for the 4K core memory of the PDP-Sis.

The authors will include a description of the instructions, examples of programs, and a candid explanation of advantages and limitations of this language.

The Computer Instruction NETWORK is an ESEA Title III Federal Project, covering a four-county area in Oregon. Our purpose is to assist high school students in the learning of computer concepts. Computers as an area of study, is our main goal, rather than using computers to assist the student in problem-solving in other phases of the curriculum. We feel that in order ~o fulfill our objectives, a student must have hands-on experience. Each pupil should be able to press the buttons in running his own program. Computers are supplied for each of the schools cooperating in the C. I. NETWORK. **We have been using the least expensive general-purpose PDP-BIs and other similar machines. These are portable enough to allow a sharing of machinery among several schools.**

We strive to make effective use of classroom time.

In addition to the computer and the on-line teletype, each classroom also has another teletype leased from the telephone company. Thus, one student can be pre-punching programs on tape, while another is running or debugging his program.

Also, to conserve machine time during the class period, we use what we call load-and-go preparation programs. These allow the student to pre-punch an appropriate tape on the off-line teletype, and read it into the computer. As the tape is being read, the preparation program is translating the teletype codes into machine language instructions which are immediately stored in the computer's memory. Now as soon as the tape has been read, the program is ready to be run. There is no waiting for intermediate tapes to be punched or processed. Operational at the present time are the Machine Language Loader (MALL) and C. I. NETWORK's Instructional Compiler (CINIC). Assembly Loader of C. I. NETWORK (ALCIN) is still in the developmental stage.

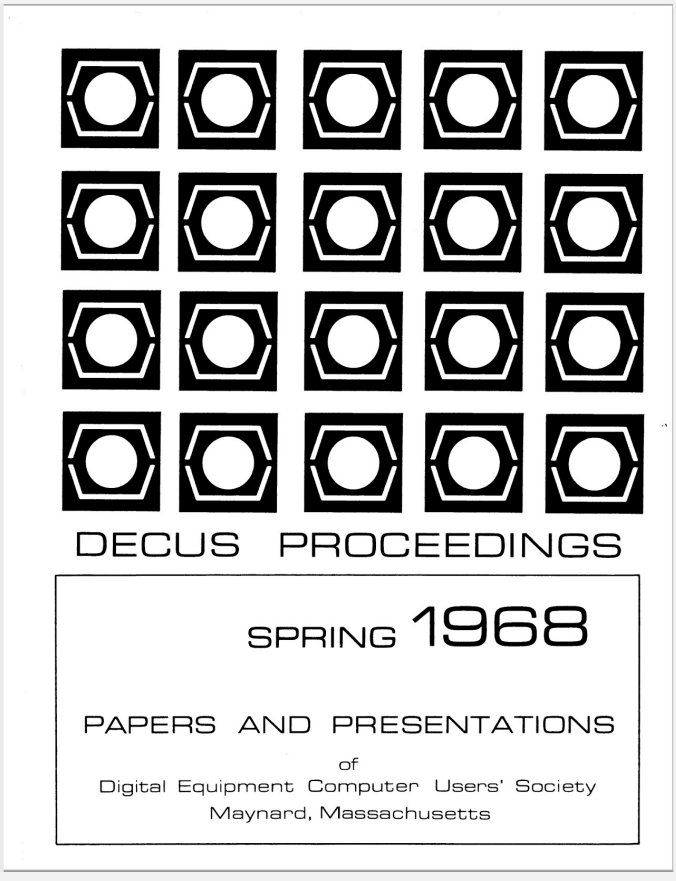
The Machine Language Loader program allows the programmer to type the first address of a block of computer storage, and then type the instructions or data to be deposited in that block. The MALL program translates the octal teletype codes into machine binary configuration and deposits each word in successive storage locations. A new block may be started at any time, by typing the first address of that block. When using this procedure, the only storage locations not available to the programmer are the page and a half containing the RIM, BIN, and MALL loading programs.

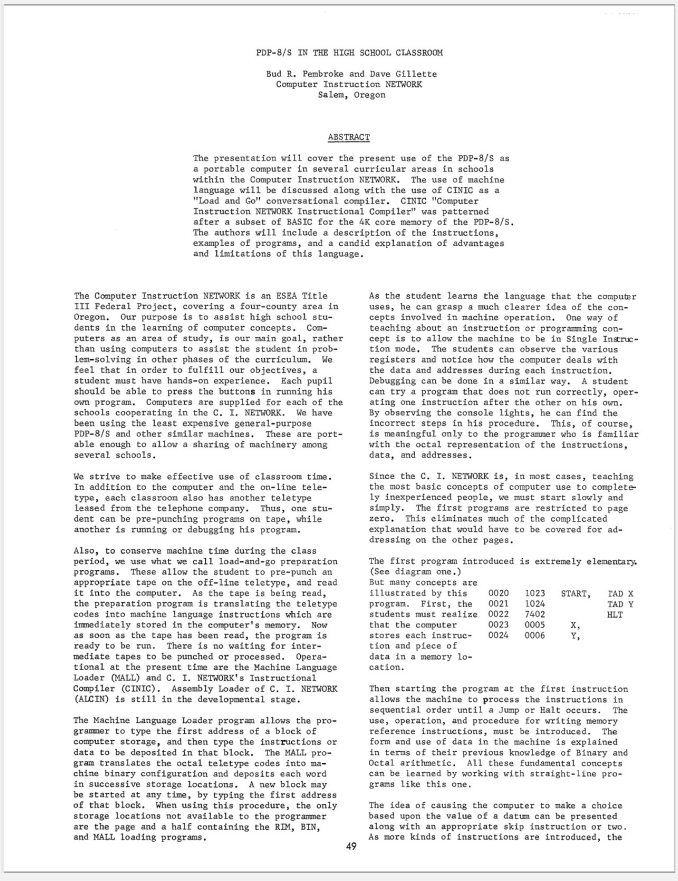
As the student learns the language that the computer uses, he can grasp a much clearer idea of the concepts involved in machine operation. One way of teaching about an instruction or programming concept is to allow the machine to be in Single In~ruction mode. The students can observe the various registers and notice how the computer deals with the data and addresses during each instruction.

Debugging can be done in a similar way. A student can try a program that does not run correctly, operating one instruction after the other on his own.

By observing the console lights, he can find the incorrect steps in his procedure. This, of course, is meaningful only to the programmer who is familiar with the octal representation of the instructions, data, and addresses.

Since the C. I. NETWORK is, in most cases, teaching the most basic concepts of computer use to completly inexperienced people, we must start slowly and simply. The first programs are restricted to page zero. This eliminates much of the complicated explanation that would have to





PDP-8/S IN THE HIGH SCHOOL CLASSROOM

Bud R. Pembroke and Dave Gillette
Computer Instruction NETWORK
Salem, Oregon

ABSTRACT

The presentation will cover the present use of the PDP-8/S as a portable computer in several curricular areas in schools within the Computer Instruction NETWORK. The use of machine language will be discussed along with the use of CINIC as a "Load and Go" conversational compiler. CINIC "Computer Instruction NETWORK Instructional Compiler" was patterned after a subset of BASIC for the 4K core memory of the PDP-8/S. The authors will include a description of the instructions, examples of programs, and a candid explanation of advantages and limitations of this language.

The Computer Instruction NETWORK is an ESEA Title III Federal Project, covering a four-county area in Oregon. Our purpose is to assist high school students in the learning of computer concepts. Computers as an area of study, is our main goal, rather than using computers to assist the student in problem-solving in other phases of the curriculum. We feel that in order to fulfill our objectives, a student must have hands-on experience. Each pupil should be able to press the buttons in running his own program. Computers are supplied for each of the schools cooperating in the C. I. NETWORK. We have been using the least expensive general-purpose PDP-8/S and other similar machines. These are portable enough to allow a sharing of machinery among several schools.

We strive to make effective use of classroom time. In addition to the computer and the on-line teletype, each classroom also has another teletype leased from the telephone company. Thus, one student can be pre-punching programs on tape, while another is running or debugging his program.

Also, to conserve machine time during the class period, we use what we call load-and-go preparation programs. These allow the student to pre-punch an appropriate tape on the off-line teletype, and read it into the computer. As the tape is being read, the preparation program is translating the teletype codes into machine language instructions which are immediately stored in the computer's memory. Now as soon as the tape has been read, the program is ready to be run. There is no waiting for intermediate tapes to be punched or processed. Operational at the present time are the Machine Language Loader (MALL) and C. I. NETWORK's Instructional Compiler (CINIC). Assembly Loader of C. I. NETWORK (ALCIN) is still in the developmental stage.

The Machine Language Loader program allows the programmer to type the first address of a block of computer storage, and then type the instructions or data to be deposited in that block. The MALL program translates the octal teletype codes into machine binary configuration and deposits each word in successive storage locations. A new block may be started at any time, by typing the first address of that block. When using this procedure, the only storage locations not available to the programmer are the page and a half containing the RIM, BIN, and MALL loading programs.

As the student learns the language that the computer uses, he can grasp a much clearer idea of the concepts involved in machine operation. One way of teaching about an instruction or programming concept is to allow the machine to be in Single Instruction mode. The students can observe the various registers and notice how the computer deals with the data and addresses during each instruction. Debugging can be done in a similar way. A student can try a program that does not run correctly, operating one instruction after the other on his own. By observing the console lights, he can find the incorrect steps in his procedure. This, of course, is meaningful only to the programmer who is familiar with the octal representation of the instructions, data, and addresses.

Since the C. I. NETWORK is, in most cases, teaching the most basic concepts of computer use to completely inexperienced people, we must start slowly and simply. The first programs are restricted to page zero. This eliminates much of the complicated explanation that would have to be covered for addressing on the other pages.

The first program introduced is extremely elementary. (See diagram one.)
But many concepts are illustrated by this program. First, the students must realize that the computer stores each instruction and piece of data in a memory location.

```
0020   1023   START,   TAD X
0021   1024            TAD Y
0022   7402            HLT
0023   0005     X,
0024   0006     Y,
```

Then starting the program at the first instruction allows the machine to process the instructions in sequential order until a Jump or Halt occurs. The use, operation, and procedure for writing memory reference instructions, must be introduced. The form and use of data in the machine is explained in terms of their previous knowledge of Binary and Octal arithmetic. All these fundamental concepts can be learned by working with straight-line programs like this one.

The idea of causing the computer to make a choice based upon the value of a datum can be presented along with an appropriate skip instruction or two. As more kinds of instructions are introduced, the

concept of looping is needed. One of the simplest loops to explain is a multiplication by repeated addition. The use of a counter as an end of loop decision is given in this type of loop. Print-out loops give a variety to the loop concept. Teaching the needed IOT instructions, and showing the process of the modification of instructions, allows students to have the computer type messages. Another basic concept that is introduced at this time is the use of the comparison of teletype codes as an end-check on the loop. Additional concepts that we feel are basic are the initialization of variables and the use of subroutines.

If time allows, other more sophisticated programming ideas can be presented to the class. But all additional programming concepts would simply be combinations of the above-mentioned basic concepts. Of course the hardware features of the particular machine in use, such as the increment and skip instruction, indirect addressing, auto-indexing, interrupt, etc., can also be learned if the computer is to be available for an extended period of time.

The third and final phase of our computer language requirements was that of a compiler language. We felt that this language should satisfy the following requirements:

The language should give an understanding and reflect recent developments in computers and compilers.

It should be a language that would simplify the teaching of fundamental programming techniques with a minimum of extraneous and superfluous compiler requirements.

Third, it should be a language that would allow high school students to use the compiler as a tool in math, science, and social studies classes.

There should be a minimum turnaround time and not use up valuable class time compiling the programs.

And finally, we felt that hands-on experience is valuable and would prefer on-line debugging.

The model we picked to pattern our language after was the compiler language "BASIC". This is a time-sharing language with a wide-spread and growing usage, and, as a result, would be a "living language" satisfying our requirements.

Our language, "CINIC", Computer Instruction NETWORK's Instructional Compiler, is a subset of BASIC. It is a "load and go" conversational compiler on a standard PDP-8/S with a 4K memory and a model 33 A.S.R. teletype input and output.

The following is a description of CINIC's instruction and command repertory:

Writing the Program

Below is a sample program written in CINIC. The program computes the total amount paid back in a year for a given principal and rate of interest.

```
10 PRINT"PLEASE TYPE THE PRINCIPAL AND INTEREST RATE"
20 INPUT P, I
30 LET A = P*I+P
40 PRINT "AMOUNT IS" A
50 GO TO 10
60 END
```

Explanation of program:

Statement 10:
The computer will type on the Teletype:

PLEASE TYPE THE PRINCIPAL AND INTEREST RATE

Statement 20:
The computer will type a "?" and wait while you type the principal and then the interest rate.

Statement 30:
(P times I) plus P will be computed.

Statement 40:
The computer will type out

AMOUNT IS (and the value for the amount)

Statement 50:
The computer will then "loop" back to statement 10 and repeat the above operations.

Statement 60 indicates the last instruction.

Statement Numbers

Each statement must be preceded by a two-digit number (10 through 99). You may type statement numbers in any order. The program will run in numerical order.

Instructions

Following each statement number is an instruction. The instructions possible are:

a. PRINT
b. INPUT
c. LET
d. GO TO
e. IF, THEN
f. END

a. PRINT

The PRINT instruction commands the computer to type. If PRINT is followed by a letter or series of letters, the values assigned to these variables will be typed. If a comma is used to separate the variables, five spaces will be output between the numerical values. If PRINT is followed by any series of characters enclosed within quotation marks, the enclosed characters will be reproduced exactly. Examples:

```
27 PRINT A
   The Tty would print the value for A in expo-
   nential form.  If A were equal to 25, then
   +0.2500000E+02 would be typed.  (See explana-
   tion of exponential form.)

35 PRINT "AMOUNT IS"
   The Tty would type
   AMOUNT IS

41 PRINT
   The above statement is interpreted by the com-
   puter as a wish for a blank line.
```

b. INPUT

The input instruction should be followed by a letter or series of letters separated by commas. When the instruction is executed, the computer will type a "?", stop, and wait for you to type the values you wish assigned to each variable.
Example:

```
21 INPUT A, B
   On executing this instruction, the computer
   would give the following results if you typed
   a "5," and a "7,"
? 5,
? 7,
```

c. LET

The LET instruction is used to define a value for a variable. This assigned value may be a single number or an algebraic expression involving some arithmetic operations. The arithmetic operations possible are:

sign	operation	example
+	add	A + Z
-	subtract	3 - 5.03
*	multiplication	B * C
/	divide	12/3
↑	exponentiation (exponents may be integer constants only)	A↑2 (means A^2)
( )	parentheses may be used in pairs to clarify any algebraic expression.	

Order of priority of operations:

1. Values inside parentheses
2. Powers or exponents
3. Multiplication and division
4. Addition and subtraction

Operations are performed from left to right for all operations with equal priorities. In the absence of parentheses in a formula involving only multiplication and division, the operations are performed from left to right. This means that A/B*C gives a value for (A/B)*C.

```
32 LET S = 5
   Defines the variable S as equal to 5.

40 LET Y = 4*A*X↑2+X
   Defines Y to equal 4AX^2+X

55 LET Y = 2^(2*A-B)/3
   Defines Y to equal 2(2A-B)/3
```

d. GO TO

A GO TO instruction is always followed by a statement number, directing the computer to go to another statement. The computer will execute instructions in numerical order unless re-directed by a GO TO statement or an IF, THEN statement.

```
23 GO TO 14
   This statement redirects the computer to take
   statement 14 as its next instruction.
```

e. IF, THEN

This statement allows the computer to make a decision.

```
20 IF X = 0 THEN 85
   The computer will go to statement 85 if X = 0;
   otherwise, it will execute the next statement
   after 20.

34 IF X < N THEN 97
   If X is less than N, statement 97 will be exe-
   cuted.  If not, the next statement after 34 will
   be executed.
```

f. END

The END statement must be the last statement in the program, and must contain the largest statement number used in the program. END signals the computer that the entire program has been loaded.

Commands

When the computer types "READY", it is indicating that it is waiting for a command or instruction. It will type "READY" after:

You type an END statement indicating the program is complete.
It has executed the program.
It receives a stop command, "S", from the keyboard.

If at this time you type:

NEW the computer clears the memory of an old program and waits for your new program.

RUN the computer will execute your program.

A statement number and statement the computer will add this new instruction to the existing program.

S If, while the computer is running a program, you wish it to stop, type "S". It will stop and type READY. (This will not operate during an input statement.)

STORED PROGRAM

Computers are unable to solve a problem unless a "program", or list of instructions, has been stored in the computer memory. To solve a problem, then, the programmer must follow a sequence of three steps:

1. Write the program. Using the CINIC language, write a list of instructions which will solve the given problem.

2. Load the program. Load the list of instructions into the computer memory. This is usually done by simply typing the program on the Teletype keyboard.

If someone else is using the computer, you may punch a program tape by typing your program on a separate, off-line Teletype with the tape punch ON. Then carry your program tape to the computer's Teletype and insert the tape in the tape reader. After the computer types READY, type "NEW", a Carriage Return, and place the tape reader switch in START position. The program will be quickly loaded into memory. After the tape has loaded, place the tape reader switch in STOP position.

3. Run the program. Loading a program is like loading a gun: You are only prepared for action; nothing happens until you pull the trigger. After a program has been loaded, you execute or run the program by typing "RUN" and a Carriage Return on the Teletype.

Numbers

All numbers are limited to seven digits. Decimal points may be used if preceded by a number. If a

number larger than seven digits is desired, exponential form may be used.

Exponential Form

Numbers written in exponential form (or "scientific nation") consist of two parts separated by the letter "E": the significant digits of the number, followed by a power of ten. To find the true number, multiply the indicated number by the indicated power of ten. For example:

```
    0.5120000E+03
```

would be interpreted as 0.512 X 10^3, or 512. (The "E" stands for "Exponent".) Similarly, 0.1000000E-09 would be the same as 0.1 X 10^{-9} or 0.0000000001. All numbers output from the computer will be normalized and printed in exponential form. Thus:

```
    0.8357210E+03
```

would be interpreted as 835.721

Variables

A variable may be defined as any single alphabetic character, A through Z.

Legal Characters

Any numeric or alphabetic character may be used in a program. All other characters and punctuation marks are illegal, with the following exceptions:

1. Those operators defined in a LET statement.
2. Anything inside quotation marks in a PRINT statement.
3. Commas used outside quotation marks in a PRINT statement to generate five spaces or to separate variables in an INPUT statement.
4. =, >, < may be used in an IF, THEN statement.
5. Decimal points may be used if preceded by a number. (Example: 0.52)
6. Spaces may be used anywhere, as needed.
7. Carriage returns to indicate the completion of a statement or command.
8. Line feeds when necessary after a carriage return.

Error Messages

If a statement is incorrectly typed, an error message may be typed by the computer. All error messages start with an "E" and are followed by an error code letter and a statement number.

```
EA indicates a general format error.
   Correction:  Check your statement with descrip-
     tion of correct format under Instructions.
   Check also forms for Numbers, Variables, and
     Legal Characters

EB indicates a statement number error.
   Correction:  See Statement Numbers

EC indicates the length of statement exceeds
   acceptable limits for CINIC.  (about 65 char-
   acters)
   Correction:  Divide into two statements

ED indicates the total length of the program ex-
   ceeds acceptable limits for CINIC.
   Correction recompile and:
     1.  Omit errors
     2.  Omit any unnecessary groups of parentheses
         in LET statements
     3.  Reduce size of and/or omit PRINT state-
         ments

EE indicates the total number of constants exceeds
   the limits of CINIC (about 50)
   Correction:  Recompile and limit the number of
     constants
```

Example:

```
  you type        70 LET X-5
  Error message   EA 70 (Format error in statement 70)
```

Making Corrections in a Program (On-Line)

If an error is made while typing on-line (connected to the computer), simply type a semi-colon, carriage return, and re-type the statement.

After a program has been executed, if you wish to insert or change a statement, just type the desired statement or statements.

To delete an entire statement, type the same statement number followed by a carriage return.

To replace a statement, type the same statement number and the new statement.

To insert a new statement between two other statements, choose any previously unused statement number that falls numerically between the two other statements.

After all corrections are made, type "RUN" and a Carriage Return to execute the corrected program.

CINIC has some definite advantages in classroom instruction. As can be seen from the preceding paragraphs, corrections may be made easily on-line. There is no classroom time lost in compiling the programs; spacing is completely optional, and turnaround time is an immediate response. The following example requires no format statement.

```
60 PRINT "THE ANSWER IS" A
```

There are no fixed or floating point requirements as this let statement demonstrates.

```
35 LET A = 21*(X*I)↑3-(5.21*6.23E-3)
```

The concepts of looping can be taught readily as in the example below. Also, this gives a student the chance to study relationships between dependent variables. In this case, the radius is allowed to range and the area can be observed.

```
20 PRINT "RADIUS AREA"
30 LET R = 1
40 LET A = 3.1416*R↑2
50 PRINT R, A
60 LET R = R+1
70 GO TO 40
```

Given the mathematical background with only a few minutes' instruction, students can write programs such as the one below. Then, by experimenting, will discover more about programming and the mathematics involved as in this case we must consider those cases where "D" is zero.

```
    AX + BY = C
    GX + HY = I

10 INPUT A B C G H I
20 LET D = A*H-G*B
30 LET X = (C*H-I*B)/D
40 LET Y = (A*I-G*C)/D
50 PRINT "X=";X, "Y=";Y
```

CINIC does have limitations. The first of these is the necessity to keep programs short. Programs should be kept to less than 20 to 30 statements depending on the type of statement. The output mode is limited to exponential form. There are no functions available and lastly the student cannot list his program. In order to overcome these limitations we have attempted to supplement study by using time-sharing with a larger computer for those problems that require a stronger language.

With our multi-level language approach to computer science in the high school, we, of the C. I. NETWORK, feel that the students get a good, well-rounded exposure to computers and programming. Although we do not claim to train technologically-capable programmers, a student, upon finishing our introductory course, can more easily decide whether a profession in computers would appeal to him or not. If the desire is present, he can go on for more training that will finish preparing him for a job in the vast computer field. Our plan is to continue this procedure in the future, adding refinements as they are completed.

CAPITAL JOURNAL, Salem, Oregon, Tuesday, July 16, 1968, Sec. 1, Page 3

She'll Head Project on Computers

Judith Edwards, head of the Computer Instruction Network in Salem, this fall will direct a new National Science Foundation program at Oregon State University.

The $200,000 grant was announced today by OSU President James H. Jensen.

Teachers in 15 Oregon high schools and community colleges will participate in a program to learn about computers.

D. D. Aufenkamp, OSU's computer center director, will participate in the project, as will Katherine Porter, a faculty member. Mrs. Edwards and her present staff — Bud Pembroke, Dave Gillette and Don Holznagel—all will join the OSU faculty temporarily to handle the project. All except Holznagel will continue to work part-time with Computer Instruction Network, a federally financed agency which teaches computer methods in mid-valley schools.

Mrs. Edwards, of Independence, is a former Parrish Junior High School teacher. She has just completed teaching a three-week National Science Foundation seminar in computers at Oregon College of Education.

1968 - DEC Users Society - CINET-BASIC - Papers presented by Bud Pembroke

1968-vol-7-no-1-decuscope-dec-users-society.pdf

Papers -

CONVERSATIONAL BASIC ON THE PDP-8 LINE

Bud R. Pembroke and Dave Gillette, Computer Instruction NETWORK, Salem, Oregon

This paper will concern itself with the use of CINET -BASIC in the classroom. It will include sample problems and a discussion of the variations between this BAS IC and other existing BAS IC languages. CINET -BAS IC (Computer Instruction NETwork's BAS IC) was written using FOCAL's subroutines for the standard PDP-S series with 4K memory and ASR-33 Teletype.

1968-vol-7-no-1-decuscope-dec-users-society-cover-img-1.jpg

available module positions, a much greater range of support functions, a greatly expanded control panel, access to all standard PDP-8 I/O lines and "Micro-8" control lines.

The principal difference, however, is that all of these signals are mapped into a 34 by 66 pin patchboard receptacle. This allows for off-line wiring of several devices on removable patchboards and time sharing of the main facility for on-line debugging and demonstration.

Devices built using this facility are described, and an extension of the patchboard concept is discussed.

A LIMITED MULTI-TERMINAL SYSTEM FOR CAI

Daivd A. Ensor, Department of Computer Applications, The Ontario Institute for Studies in Education, Toronto, Ontario, Canada

The paper describes a suite of PDP-9 programs to provide a multi-terminal "CAI" facility for both laboratory experimental use and also to give interested school boards the opportunity for some on-line experience. The OISE configuration is briefly outlined, and both the author language and its processors are discussed in addition to the multi-access software and the batch-time system. It is hoped eventually to run up to 64 terminals through a line concentrator with the system as a foreground program under the Advanced Software System.

LOGO - A PROGRAMMING LANGUAGE FOR CHILDREN, TEACHERS, AND MATHEMATICIANS

Wallace Feurzeig, Bolt Beranek and Newman, Cambridge, Massachusetts

Logo was expressly designed as the starting point for a new kind of curriculum in which programming languages are used to provide a conceptual framework for the teaching of mathematics. The structure of Logo embodies mathematically important ideas with minimal interference from programming conventions. It permits the expression of mathematically rich non-numerical algorithms as well as numerical ones. It can be introduced to third-graders, for simple tasks, with relative ease. Carried forward, it may contribute markedly toward increasing literacy in the skills of logical thinking and expression.

PATTERN AND RATE OF CONVERGENCE OF THE PERTURBATION TECHNIQUE IN THE TREATMENT OF LINEAR AND NONLINEAR PLATE PROBLEMS

Dr. S. F. Ng, Department of Civil Engineering, University of Ottawa, Ottawa, Ontario, Canada

An approximate method based on the Perturbation technique is used to solve the small and large deflection problems of the bending of circular, elliptical and skewed plates resting on an elastic support. The influence of the variable parameters such as the plate aspect ratio, skew angle, poisson's ratio and foundation modulus on the pattern of convergence is investigated. The algorithm of the solutions and the manipulations of the matrix equations are programmed utilizing direct access devices. Results of this investigation indicate that the rate of convergence of the method decreases rather rapidly with increase in the number of variable parameters both in the linear and nonlinear theory of plates. Results showing the effect of each of the plate parameters on the rate and pattern of convergence are plotted graphically.

CONVERSATIONAL BASIC ON THE PDP-8 LINE

Bud R. Pembroke and Dave Gillette, Computer Instruction NETWORK, Salem, Oregon

This paper will concern itself with the use of CINET-BASIC in the classroom. It will include sample problems and a discussion of the variations between this BASIC and other existing BASIC languages. CINET-BASIC (Computer Instruction NETwork's BASIC) was written using FOCAL's subroutines for the standard PDP-8 series with 4K memory and ASR-33 Teletype.

Panel Discussion

TRAUMA INVOLVED IN STARTING A NEW COMPUTER SCIENCE PROGRAM AT A UNIVERSITY

Dr. Wayne A. Muth, Moderator
Southern Illinois University, Carbondale, Illinois

Discussion would include curriculum and program requirements; options and/or electives within a program; Ph.D. vs. M.S. vs. V.S. vs. two-year technical programs (trade-offs and considerations); staffing requirements; interaction with other departments; startup of a new program using available personnel, courses, and other resources.

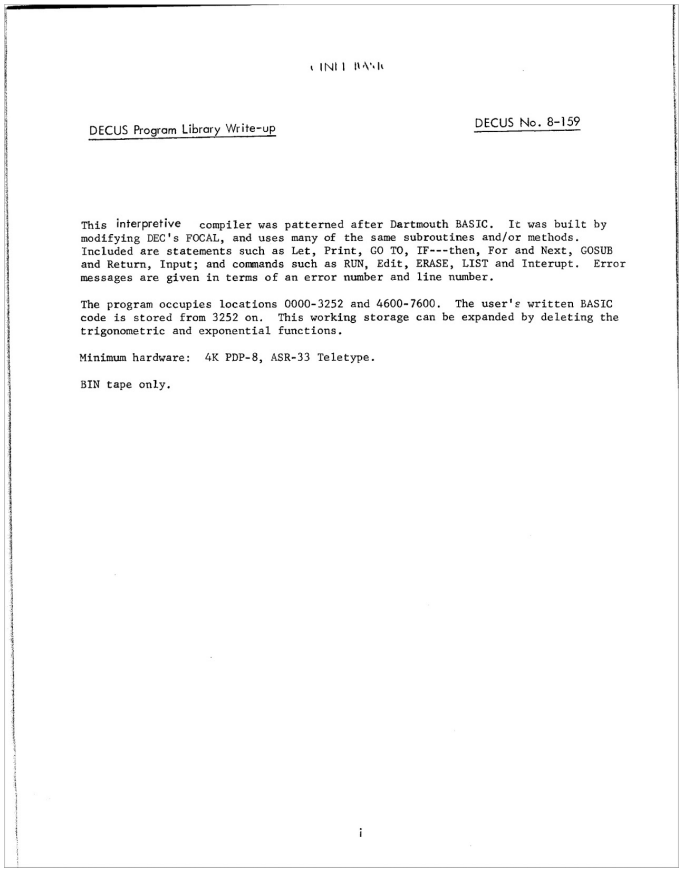
ATTENTION

This is a USER program. Other than requiring that it conform to submittal and review standards, no quality control has been imposed upon this program by DECUS.

The DECUS Program Library is a clearing house only; it does not generate or test programs. No warranty, express or implied, is made by the contributor, Digital Equipment Computer Users Society or Digital Equipment Corporation as to the accuracy or functioning of the program or related material, and no responsibility is assumed by these parties in connection therewith.



CINET-BASIC

DECUS Program Library Write-up DECUS No. 8-159

This interpretive compiler was patterned after Dartmouth BASIC. It was built by modifying DEC's FOCAL, and uses many of the same subroutines and/or methods. Included are statements such as Let, Print, GO TO, IF---then, For and Next, GOSUB and Return, Input; and commands such as RUN, Edit, ERASE, LIST and Interupt. Error messages are given in terms of an error number and line number.

The program occupies locations 0000-3252 and 4600-7600. The user's written BASIC code is stored from 3252 on. This working storage can be expanded by deleting the trigonometric and exponential functions.

Minimum hardware: 4K PDP-8, ASR-33 Teletype.

BIN tape only.

PREFACE

In 1962 two teachers in Oregonschools 30 miles apart began experi-menting with teaching about computers.During the next three years, Mrs.Marian Putnam at North Salem HighSchool and Mr. Bud Pembroke at LakeOswego High School successfullyincorporated one-month units in computerconcepts into existing mathematics courses.

Students in these classes learned about computersby actually programmingand operating a simple digital computer.The classroom computer had beendeveloped several years earlier at OregonCollege of Education with a grantfrom the National Science Foundation.

The Salem School District and the StateDepartment of Education,

together with the Marion County IntermediateEducation

VI

'strict, decided in1965 the good things happening in thesetwo schools should be studiedandexpanded to other districts.

A proposal for a planning grant waswritten and funded under TitleIIIof the Elementary and Secondary EducationAct.Forty secondary schools ina four-county areaparticipated in the eight-month planningphase which began!n the summer of 1966.It resulted in an operational grantfor a program,which began in the summer of1967.The, Title III` ;project, called ComputerInstruction NETWORK, has operatedthrough the Marion County IEDand has received some $100,000 per year foreach of three years.

Several new procedures for computer instruction have been tried andevaluated.The results of these experiences are reported in this monographto help other schools plan and implement programs for teaching with and about computers.

EXPO: A Flexible PDP-8 Data-Acquisition Program

Bruce Arne Sherwood, California Institute of Technology, Pasadena, California

EXPO is a PDP-8 program which reads various kinds of data from experimental apparatus, optionally logs data on magnetic tape, and accumulates one - or two-dimensional histograms of selected variables. These histograms may be displayed on the Teletype or scope, simultaneously with data-acquisition. From the keyboard the user defines what variables are to be histogrammed and under what conditions; variable names are symbolic and numerical parameters are decimal. Also from the keyboard, the user may call for Teletype or scope output with some control of format. Because of its flexible user-oriented input-output, EXPO has proven to be very useful in debugging and utilizing complex apparatus in a high-energy physics experiment; it is likely to be useful in similar experimental situations in science or engineering. The write-up includes a useful general discussion of interrupt handling on the PDP-8.

Minimum Hardware: 4K PDP-8 with EAE, Magtape, Scope Display, and Plotter optional

DECUS No. 8-161 (Continued)

Source Language: LRL Assembler (DECUS No. 5-13) on cards

Storage Requirement: 0-7177 if all options used

DECUS No. 8-164

Prime Number Determination

Richard D. Cherrington, U. K. Atomic Energy Authority, Springfield Works, Salwick, Preston, England

This program types out by successive division all previously determined primes which are less than or equal to square roots of the numbers being evaluated.

Short additional programs cause additional type out of all nonprime numbers as a product of two integers.

Other Programs Needed: Floating Point Interpretive Package (DEC-8-5-S)

Storage Requirement: 4K

DECUS No. 8-165

The PDP-8 Simulator System for Philco 212

Neal Laurance, Ford Motor Company, Dearborn, Michigan

A program has been developed which provides the facility to simulate the operation of a PDP-8 computer within a Philco 212 computer. The system includes the ability to assemble PDP-8 programs in assembly language, produce paper tapes suitable for running on a PDP-8 and to simulate the execution of a PDP-8 program completely within the Philco 212. The simulation facility should be of use to people who are anticipating the delivery of a PDP-8 computer, and who wish to do program development before its arrival. The simulator portion is written in Philco 212 assembly language (it is not 211 compatible), and the remainder of the system is written in the MAD language.

Write-up only available.

CINET-BASIC

http://bitsavers.informatik.uni-stuttgart.de/pdf//pcm/PCM-12A_4k_Basic_Manual_Dec75.pdf

1975-12-pcm-inc-12a-4k-basic-manual.pdf

SECTION1. 0

INTRODUCTION

CINET-BASIiCs a binary-fotmat program originally written for DEC's PDP-8 computer by Bud Pembroke and David Gillette of the Computer Instruction Network, Salem, Oregon. The program is fully compatible with the PCM-12 computer manufactured by PCM, Inc., San Ramon, California. While not as powerful as the other BASIC language interpreters available from DEC for the PDP-8 series computers, CINET-BASIiCs nonetheless a powerful programming tool in the hands of an experienced programmer. For the beginner, it is perhaps easier to learn than most forms of BASIC, due to the abbreviated list of available instructions. The interpreter requires a PCM-12w ith 4096 words of memory and a Model 33 or 35 Teletype or CRT terminal as a minimum system configuration. The Teletype machine wi 11 a 11 ow use of paper tape; a CRT terminal used for input/output will require use of a separate paper tape reader for program entry, or optionally, an audio cassette recorder with the cassette form of the interpreter. No listing of the interpreter is available.

The CINET-BASIiCn terpreter is available to members of the Digital Equipment Corporation User's Society (DECUSi)n paper-tape form. Ordered from DECUS,

CINET-BASIcCo mes with a PDP-8 oriented write-up. The DECUSca talog number is

#8-159.

This BASIC-language interpreter has been successfully checked out by PCM, Inc. on the PCM-12 computer. However, PCM makes no representation of any kind as to the accuracy, reliability or performance of this software,, and assumes no responsibility for the use of CINET-BASIiCn the user's equipment or system.

PCM reserves the right to change, modify, delete or add to the information given in this manual, and to the binary paper tape, at any time without notice.

NOTE: DEC, PDP, FOCAaLn d DECUSar e registered trademar~s of Digital Equipment Corporation, Maynard, MA. Teletype is a registered trademark of the Teletype Corporation, Skokie, IL.

From what I have heard, the TSS8 BASIC is ghastly compared to all of the other PDP-8 BASIC implementations, not that they are all that equal in capability either, but they occupy different corners of the same "universe" at least whereas the TSS8 one is in "uncharted space".

Many of the implementations of **PDP-8 BASIC [the rest of them!] are the product of a small number of people,** all my long-term friends.and colleges from Brookllyn Poly. They all bounced ideas off of each other, and thus they have common "roots" in many ways.

There is also an effect of "perfecting" their craft, thus the newer ones in certain ways exceed the previous ones [but not necessarily and of course there are steps backwards]..

There is actually one additional "BASIC" that is definitely worse: So-called CINET "BASIC".

This is a sham program. It is nothing more than patched FOCAL so the command names seem to be somewhat more BASIC-like. That said, FOCAL is not written to flow the same way as BASIC, thus even if you state some code within it somewhat successfully, it won't work the same way! In fact, FOCAL shares some of the same limitations of later languages such as PASCAL that are incapable of breaking out of loops because there is no proper stack manipulation. You seem to break out, yet it continues to execute from the top anyway!

[Note: FOCAL is more of a "structured" language because it really doesn't implement unconditional GOTO; in loops it just can make "local" changes and the statements are all performed with a DO statement, etc.

BASIC to be faithful must be able to purge any stack in place so that when you leave an interative loop, you really leave it. This is taken for granted in languages such as FORTRAN and PL/I where the stacks are either non-existent or carefully defined.

A different project at Brooklyn Poly [some of the same people worked on that as well] was based on a descriptor language, etc. where the following two key elements were implemented:

a) Mark the stack. This means that if necessary, this is the one you will want to reference. Each marked position has a unique number.

b) Purrge to mark. Any and all stack elements are removed all the way back to the proper marked stack element. Thus, the stack is always properly cleaned up.

When such language elements are allowed to be handled without regard to standards, ineveitably code written in one cannot run in another, etc.

PCM-12 computer

Floppy Interface for PCM-12 Computer

Users of the PDP-8 compatible

PCM-12 microcomputer can attach the

Data Systems Design Model 210 floppy disk system to their computers through this interface module. The 12440 module enables users to execute all PDP-8 floppy disk diagnostics and makes the PCM-12 compatible with the mass storage operating systems developed for the PDP-8. The PCM-12, built around the Intersil IM6100 microprocessor, can be used as a direct replacement for PDP-8s in many applications. The 12440 interface module sells for $259 assembled and $169 in kit form, with volume discounts of 10 to 25 percent, from Pacific Cyber/Metrix Inc, 3120 Crow Canyon Rd, San Ramon CA 94583,(415)837-5400.•

Circle 636 on inquiry card.

CINET-BASIC 8-655 Revised: 2 February 1978 Author: Bud Pembroke and David Gillette Computer Instruction Network Revised by: G. Chase, OSB Portsmouth Abbey School, RI Operating System: Paper Tape Source Language: PAL-III,ODT Memory Required: 4K Special Hardware Required: Teletype with reader/punch recom-mended Abstract: CINET·BASIC is an interpretive compiler patterned after the original Dartmouth BASIC. It was built by modifying FOCAL-69, and uses many of the same subroutines and/or methods. Included are statements such as Let, Print, GO TO, IF-then, For and Next, GOSUB and Return, Input; and commands such as RUN, Edit, ERASE, LIST and Interrupt. Error messages are given in terms of an error number and line number. The program occupies locations 0000-3252 and 4600-7600. The user's written BASIC code is stored from 3252 on. This working storage can be expanded by deleting the trigonometric and exponential functions. Revisions included with this tape include new versions of the internal 'ALIGN' and 'FIX' routines. The "INT (X)" function now yields the correct result regardless of the value of the argument. A second patch implements the "SGN (X)" function with the restriction that it yields a + I result if X = 0, and it requires the use of core locations 7600-7610. DECUS 8-655 includes a revised binary tape of CINET-BASIC, and can be loaded without a checksum error. Note: Sources and listings of CINET-BASIC are not available. Media Price Code: A2, F6

Bread Trucks and Breakthroughs: Notes from the Early Days of Educational Computing

August 5, 2013 | By Fritz Holznagel

A photo of an old van with students lined up at the back and the words 'Computer Instruction Network' on the sideBread truck computing in Oregon, circa 1968. (Photo via Judy Allens' online memoirs)

My uncle Don Holznagel recently surprised us with an email about Douglas Engelbart, the computer scientist who invented the mouse and other key features of modern computing:

"Jean alerted me to your item on Douglas Engelbart. I attended the Engelbart session referenced in all the recent news accounts of his death — the 'mother of all demos' where he demonstrated the mouse in text editing, hypertext, etc."

Wow!

Don spent much of his career in computer education. I remember visiting him in Minnesota in 1971 and playing a Civil War game on their huge mainframe computer there. It would print out the situation on paper: "You have 100 cannonballs, 1000 musket rounds," and so forth. Then it would ask something like: "Attack or retreat?" You'd type in a response and then it would print out the new set of changed circumstances to deal with. It was a big deal for a kid in those days.

I asked Don if he'd share with our readers his impressions of the Engelbart presentation and other details of that era in computing. Our interview is below.

* * *

Who2: How did you get started with computing?

Don: I was introduced to Fortran programming in a summer math workshop in 1965. At the time I was teaching math to grades 10-12 in Parkrose, Oregon. I began to teach a unit on Fortran in an advanced math course, a 12th-grade Analysis class. We didn't have computers in the schools at the time: I took the kids to the county data processing office on Saturdays so they could punch the cards and run the programs.

In 1967 I attended a workshop Judy Allen taught about the BASIC language, and became highly interested in the promise of computers in math and science. Judy was a pioneer in her own right in the introduction of computers to secondary school students.

Who2: How did you end up at the Engelbart presentation?

Don: Judy Allen was running a pioneering project in computers in education at the Marion County Education Service District in Salem, Oregon. She and I became acquainted and in June of 1968 she hired me into the project. She decided to send me to the Fall Joint Computer Conference in December 1968 to soak up the latest in computing.

A poster with Douglas Englebart's face and notes on his presentationA poster for Douglas Engelbart's 1968 presentation. Image courtesy of the Bootstrap Institute.

The conference was at the San Francisco Convention Center, and the huge attendance was a mixture of computer science people and data processing types. Most were still using punched cards on batch processing computers, but many also were beginning to use interactive timesharing systems from terminals, which our project was also using in schools. I didn't have a clue about Engelbart, but many in the audience were familiar with his research. However, all of us including the computer science types were blown away with his presentation and demonstration.

The detail that has stayed with me these 45 years is the image of Engelbart's mouse demo, in which he used a common grocery list to show moving items around to reorder the list in categories, using only the mouse. I've remembered that image on many occasions, such as when the mouse was overshadowed by pressure pads in laptops. Even though the mouse was a research model, it worked almost flawlessly as did all of his demos.

You can actually see his presentation in a series of video clips online here. The grocery list is the substance of clip 5. In those days, this was astounding. In fact, the first 5 clips show how he grabbed everyone's attention right from the start.

The news accounts say that the audience was awestruck, and I've used the word astounding to describe the event. You didn't dare whisper to your neighbor for fear of missing something. Everyone there knew this was a turning point, that things in the field of human interaction with computers would never be the same. There was deafening applause at the end. I returned to the hotel and couldn't adequately describe what I'd seen to my wife, Jean. I knew though that our use of interactive timesharing in schools was on the right track.

Who2: What was the general attitude toward computers in schools at the time?

Don: Essentially, few teachers and administrators envisioned them as useful in the classroom. They all knew that the payroll and class scheduling were done on a computer. The purpose of our project and a few others around the country funded at the same time was to explore and demonstrate other possibilities.

The first application that most teachers and administrators thought of was teaching kids to write programs. Their thought was that if computers are the future, we need to be preparing kids to use them. It seemed obvious then to parents and educators that an actual computer programming skill was what would give their kids a leg up on the future.

Nobody knew how computers could assist in teaching history or chemistry, and there was no software to help. Development of software, teacher guides, and teacher training was the work of the 1970s and '80s.

Who2: It's hard to remember, in these days of smart phones, that getting your hands on an actual computer used to be difficult.

Don: Yes. Developing microcomputers the size of typewriters came to fruition in the late '70s, and into schools through the '80s. Of course, you now hold in

Don: Yes. Developing mini-computers the size of typewriters came to fruition in the late '70s, and into schools through the '80s. Of course, you now hold in your hand computer power exceeding those by a huge margin.

Who2: How soon did you start to see any of the ideas Douglas Engelbart presented in actual working computers?

Don: It was a long time. I think the mouse was first marketed with the original Mac in 1984, but Apple had licensed it earlier in the development. In any case, it was 16 years from the Engelbart demo until it could be bought by any average person.

An IBM 1130 photo, with old-fashioned keyboard and a big ol' mainframeAn IBM 1130 computer console. Photo by Martin Skott, via Wikipedia.

Who2: What was your career with Judy Allen like?

Don: Judy's project in Marion County was a federally-funded project called the Computer Instruction Network. The CIN project was based on three systems.

The "bread truck" — so-called because it was a delivery van of that style — housed an IBM 1130 computer with paper tape input. It was scheduled to visit about 16 or so high schools over 4 counties, about 2 a day if they weren't far apart. Kids would write Fortran programs during the week, usually in a math class, and process them whenever the van showed up. We would drive it up to a school, trail 100 feet of cable to the nearest electric outlet, and plug in. The 3 others of us on the staff also drove that truck over four counties. Fun stuff!

The second method was to place teletype terminals with phone modems for several months in a number of schools (I don't remember how many). We provided subscription access to GE Timesharing Systems which offered a version of the interactive BASIC language. Again usually in math classes, kids could write programs, but unlike the truck, they could go to the terminal and enter the programs when they were ready without waiting, and BASIC was easier to teach and use so you could focus on the problem to solve and not the language.

Photo of a boxy old computer, all metal and plugs, with 'Digital Equipment Corporation' written on topA PDP-8 computer, now on display at the Smithsonian. Photo by Wikipedia user Alkivar.

The third system was highly experimental. It was based on DEC PDP-8 mini-computers, which would fit on a card table and were about 10 inches high, with a teletype terminal. When I got to the project at the end of its first year, Judy and the two others had been writing their own version of interactive BASIC to fit in 8K storage. I couldn't believe what they had accomplished. This meant that we could take an inexpensive computer to a school and leave it for awhile, and the kids could run as many programs as they wished without limited timeshare minutes or waiting on the truck schedule.

We used a small van to deliver it to a number of schools on a six-week schedule. This system was the wave of the future, and delivering it, doing teacher workshops, and writing teaching materials took most of my time. A neat aspect of the project was that we served small rural schools as well as the larger ones in Salem and Newberg.

Judy Allen also died in June, as it happens. Two pioneers in different parts of the field gone in a month. She was instrumental in my career in educational technology, twice hiring me for jobs: the first one in Salem and the next at the Northwest Regional Educational Lab in Portland (now Education Northwest).

Who2: What was the rest of your career like?

Don: After CIN in Salem, I worked for 10 years at TIES, a large school district cooperative in Minnesota, and then returned to Oregon to the Northwest Regional Educational Labs for 16 years. I finished my career in 1998 with 2 years at the Southeast Regional Lab in Greensboro, NC. It was an exciting time to work in educational technology, ranging from minicomputers to microcomputers to the Internet and two-way interactive video over 30 years. The most significant aspect over that time was that although many people were enamored of each new technical item, my work was focused on the improvement of instruction and the curriculum through software, which was the most important thing from my standpoint and in each of the places I worked.

Who2: You don't happen to have any snapshots of you from the old days, do you? Bonus points if you're wearing a pocket protector.

Don: Unfortunately, no. We did make a videotape in the last year of the CIN project which showed the 2 vans and some of the school locations. When I got back to Oregon, I contacted the County ESD video librarian and she said they had tossed it along with the other project materials after 10 years. In the 1970s in Minnesota and the 80s in Portland, we took some set-up shots with children of staff, but not in schools because you couldn't take random classroom pics without getting parental permission for any kids that showed up. I don't have any of the set-ups. I actually did use a pocket protector all the time in Minnesota!

* * *

Great stuff, and thanks to Don Holznagel for those fascinating details.

It's worth pointing out that both Uncle Don and Douglas Engelbart were products of the Oregon public educational system — Don at Eastern Oregon College, and Engelbart at Oregon State. That's the same public college system that produced Nobel-winner Linus Pauling (Oregon State) and so many other scientists and thinkers. Let us never stop funding public education.

Political scientist

Richard Norman Perle (born September 16, 1941) is an American political advisor who served as the Assistant Secretary of Defense for Global Strategic Affairs under President Ronald Reagan. He began his political career as a senior staff member to Senator Henry "Scoop" Jackson on the Senate Armed Services Committee in the 1970s.[2] He served on the Defense Policy Board Advisory Committee from 1987 to 2004 where he served as chairman from 2001 to 2003 under the Bush Administration before resigning due to conflict of interests.

A key advisor to Secretary of Defense Donald Rumsfeld in the Bush administration, Perle was an architect of the Iraq War.[3][4] In March 2001, he claimed that the Saddam Hussein regime possessed weapons of mass destruction.[5][6] He has been described as a neoconservative hawk on foreign policy issues.[5]

He has been involved with several think-tanks, including the Washington Institute for Near East Policy, the Center for Security Policy, the American Enterprise Institute, Project for the New American Century , and the Jewish Institute for National Security Affairs.

Early life and education[edit]

Perle was born in New York City, New York. As a child, he moved to California, where he attended Hollywood High School in Los Angeles; his classmates including actor Mike Farrell, singer Ricky Nelson, and Joan Wohlstetter (the daughter of Albert and Roberta Wohlstetter of the Rand Corporation).

Perle earned a B.A. in International Politics in 1964 from the University of Southern California. As an undergraduate he studied in Copenhagen at Denmark's International Study Program. He also studied at the London School of Economics and obtained a M.A. in political science from Princeton University in 1967.

Career[edit]

Office of Senator Henry Jackson[edit]

From 1969 to 1980, Perle worked as a staffer for Democratic Senator Henry M. Jackson of Washington whom he met through Albert Wohlstetter. Perle recalls his early involvement with Wohlstetter:

"Albert Wohlstetter phoned me one day. I was still a graduate student at Princeton ... and he said, could you come to Washington for a few days and interview some people and draft a report on the current debate shaping up in the Senate over ballistic missile defense, which was a hot issue ... And he said, I've asked somebody else to do this too, and maybe the two of you could work together. The someone else was Paul Wolfowitz. So Paul and I came to Washington as volunteers for a few days, to interview people, and one of the people we interviewed was Scoop Jackson and it was love at first sight ... I was there for eleven years." [2]

As a staffer, Perle drafted the Jackson–Vanik amendment to the 1972 International Grains Agreement (IGA), or "Russian Wheat Deal" negotiated by Richard Nixon and the Soviet Union which made for the first time by law a trade agreement contingent upon the fundamental human right of Soviet Jews to emigrate.[7] He was considered[*by whom?*] an extremely knowledgeable and influential person in the Senate debates on arms control. By his own admission, Perle acquired the reputation of an influential figure who preferred to work in the background, a reputation that has followed him through the years in both the public and the private sectors. At some point (usually said to be during his time in the Reagan Administration) Perle acquired the nickname "The Prince of Darkness", which has been used both as a slur by his critics and as a joke by supporters. (*Time*, 23 March 1987, "Farewell Dark Prince") However, he has been quoted: "I really resent being depicted as some sort of dark mystic or some demonic power. ... All I can do is sit down and talk to someone. ..." (*The New York Times*, 4 December 1977, *Jackson Aide Stirs Criticism in Arms Debate*, Richard L. Madden)

Opposition to nuclear arms reduction[edit]

Perle was considered a hardliner in arms reduction negotiations with the Soviet Union and has stated that his opposition to arms control under the Carter administration had to do with his view that the U.S. was giving up too much at the negotiation table and not receiving nearly enough concessions from the Soviets. Perle called the arms talks under negotiation in the late 1970s "the rawest deal of the century".

Perle's objection to the arms talks between the Carter administration and the Soviet Union revolved primarily around Carter's agreement to halt all cruise missile development. Perle is widely credited for spearheading opposition to the treaty, which was never ratified by the Senate.

Perle, with fellow neoconservative Paul Wolfowitz, played a supporting role in the ballistic missile defense project that was launched in the 1980s called the Strategic Defense Initiative.("Star Wars") [2] Perle was influential in creating several organizations and think-tanks in order to pressure public opinion and sway policy makers on ballistic missile defense.[2] During the second Bush administration missile defense programs saw dramatic budget increases under the

direction of Perle as chair of the Defense Policy Board.[2]

In 2010, Perle voiced opposition to the Obama administration's New START Treaty, comparing it unfavorably to the "watershed" 1987 INF Treaty signed by Ronald Reagan.[8] However, Jonathan Chait has pointed out that Perle vehemently opposed the INF Treaty when it was initially signed, calling it "flawed enough to require renegotiation with the Soviets" and arguing that "the treaty does not do many of the key things the Administration says it does."[8]

Transition into neoconservatism[edit]

Perle is a self-described neoconservative, like several around Henry M. "Scoop" Jackson, as he told Ben Wattenberg in an interview specifically about him becoming a neoconservative.[9]

> Ben Wattenberg: Now, Scoop was surrounded by people who then and certainly now are called neoconservatives. It's become a fashionable word now thanks to you and your colleagues because you're all categorized that way. How did that come into your life, that whole school of thought?
>
> Richard Perle: Well, I think the term has something to do with the sense that those of us who are now called neo-conservatives were at one time liberals, and in this ...
>
> Ben Wattenberg: Irving Kristol said a neoconservative is a liberal who's been mugged by reality.
>
> Richard Perle: Right. And I think that's a fair description, and I suppose all of us were liberal at one time. I was liberal in high school and a little bit into college. But reality and rigor are important tonics, and if you got into the world of international affairs and you looked with some rigor at what was going on in the world, it was really hard to be liberal and naïve.

Perle's book *An End to Evil: How to Win the War on Terror* which he coauthored with fellow neoconservative David Frum in 2004 criticizes American bureaucracy, civil service, and law. The book suggests that Americans must "overhaul the institutions of our government to ready them for a new kind of war against a new kind of enemy" including the FBI, CIA, armed forces, and State Department.[2] The book is also used as a defense of the 2003 invasion of Iraq and outlines important neoconservative ideas, including ways to abandon all Israeli-Palestinian peace processes, invade Syria, and implement strict US domestic surveillance with biometric identity cards and public vigilance to hinder potential terrorist immigrant or terrorist sympathizer threats.[10] Perle and Frum conclude: "For us, terrorism remains the great evil of our time, and the war against this evil, our generation's great cause ... There is no middle way for Americans: it is victory or holocaust." [2] These ideas are foundational elements of neoconservatism.

Neoconservative leadership[edit]

> Appearing on British television discussion programme *After Dark* on 10 June 1989

Over the past few decades, a tight-knit group of neo-conservatives have had a significant impact in the carving out of American foreign policies, especially those concerning the Middle East. Arguably at the helm of the neoconservative movement is Richard Perle. He has been aided by other prominent neoconservatives, including Paul Wolfowitz and Douglas Feith.

Members of the Neocon core have been interrelated for decades through positions in government, think-tanks, business corporations, and even family ties. As journalist and writer of neoconservative ideology Jacob Heilbrunn states: "neo-conservatism was turned into an actual movement by Irving Kristol and Norman Podhoretz. Even today, the neoconservative movement is best described as an extended family based largely on the informal social networks patiently forged by these two patriarchs."[2]

Members of the neoconservative movement are also leaders of many influential "letterhead organizations" (LHO's) and think-tanks such as the American Enterprise Institute, Project for the New American Century, Committee for Peace and Security in the Gulf, Committee for the Liberation of Iraq, and the U.S. Committee for a Free Lebanon.[2] These organizations act as a support system for many neoconservative beliefs and help members of the movement draft policy papers, raise money and media attention, and lobby policymakers in order to protect their own political and personal agendas. A sociologist who examined the memberships of such neoconservative organizations ultimately concluded that "the activities of fourteen organizations were coordinated by individuals who comprised a web of interlocking memberships."[2]

From 1981 to 1982 Wolfowitz was appointed head of the policy planning staff in the State Department.[2] In the same year Perle, who was an assistant secretary for international security policy in President Reagan's defense department hired and promoted Douglas Feith after he had been fired from his position as a Middle East analyst at the National Security Council.[2] Later it was found out that Feith was fired due to an FBI investigation suspecting that he had distributed confidential materials to an Israeli embassy official.[2] With the right connections and the support of his close allies Wolfowitz and Perle, Feith was able to attain his position as undersecretary for policy in the Pentagon in 2001, from which he resigned in 2005. In return, he appointed Perle as chairman of the Defense Policy Board.[2] This friendship was mutually beneficial for both Perle and Feith, who used their overlapping positions of power to help promote the other and bail each other out of trouble. Perle is nonetheless an inspiration and mentor to Feith who describes him as a "godfather" and trusts that "He would actively work to help anybody he had worked with and liked and admired and who he thought was useful to the overall cause of U.S. national security as he saw it."[2] Both Wolfowitz and Feith would eventually join forces and work closely together to promote the War in Iraq after 9/11, including heading the Office of Special Plans.

War with Iraq[edit]

Pre-2003 invasion[edit]

Like many in the neoconservative movement, Perle had long been an advocate of regime change in Iraq. In 1998 Perle led an effort known as the Project for the New American Century with close neoconservative allies Wolfowitz, Woolsey, Elliott Abrams, and John Bolton. The Project culminated in a letter sent to US President Bill Clinton calling for the military overthrow of Saddam Hussein's regime.[2] Prior to and after the 2003 invasion of Iraq, Perle held several exclusive meetings in his home where he discussed issues regarding American foreign policy on Iraq.[2] In an effort to help fund their goals, Ahmed Chalabi an Iraqi-born businessman and founder of the Iraqi National Congress, helped Perle secure millions of dollars from the U.S. government in 1990.[2] Chalabi was one of the key figures driving the war in Iraq and helped transmit important "information" to U.S. Congress and the public that would successfully help sell the war effort.[2] Moreover, Perle and Chalabi also had very similar motives: they both wanted the Hussein regime deposed and Chalabi elected president.[2] In 2004, the FBI investigated Chalabi after U.S. intelligence sources revealed that he was working as a double agent for Iran.[2] Perle was also involved in efforts to develop alternative intelligence estimates to help justify the decision to go to war in Iraq. He and other neoconservative leaders claimed that the intelligence community had grossly underestimated threats to the national security of the U.S.[2] Thus, they established two secret offices in the Pentagon

after September 11 – the Counter Terrorism Evaluation Group and the Office of Special Plans.[2] Nonetheless, Perle helped manage and hire neoconservative affiliated staff for both these organizations that created their own policies and intelligence reports by dodging existing government entities.[2] Perle's reasoning for implementing the Office of Special Plans was essentially to "bring in people with fresh eyes to review the intelligence that the CIA and other agencies had collected."[2] In an interview with CNN on September 16, 2001 Perle announced "Even if we cannot prove to the standards that we enjoy in our own civil society that they were involved, we do know, for example, that Saddam Hussein has ties to Osama Bin Laden ..."[11] Flynt Leverett, a senior staff member of the Bush National Security Council states: "There were constant efforts to pressure the intelligence community to provide assessments that would support their views. If they couldn't get what they wanted out of the intelligence community, they simply created their own intelligence."[2] Moreover, Perle allegedly gave several speeches and talks throughout Europe trying to promote the war effort abroad. He allegedly told the British House of Commons that the U.S. would attack Iraq even if UN weapons inspectors didn't find anything.[2] Lawrence Wilkerson, former chief of staff to Secretary of State Colin Powell announced that Perle was "making remarks as if he were an official inside the U.S. government."[2] In countries like Germany, France, Britain, and Japan, people perceived him as a government authority whose knowledge and clout on U.S. policy appeared legitimate.[2]

Perle argued that what he referred to as terrorist Abu Nidal's "sanctuary" in Saddam Hussein's Iraq was justification for the U.S. military invasion of Iraq. Perle states this in the recent PBS documentary series "America At A Crossroads", and refers to President Bush's 9/11 speech in which Bush stated: "We will make no distinction between the terrorists who committed these acts and those who harbor them."

In an interview for "Saddam's Ultimate Solution", the 11 July 2002 episode of the PBS series *Wide Angle*, he said:

"Saddam is much weaker than we think he is. He's weaker militarily. We know he's got about a third of what he had in 1991. But it's a house of cards. He rules by fear because he knows there is no underlying support. Support for Saddam, including within his military organization, will collapse at the first whiff of gunpowder. Now, it isn't going to be over in 24 hours, but it isn't going to be months either."

Perle advocated invading Iraq with only 40,000 troops, and complained about the calls by then Gen. Eric Shinseki to use 660,000 troops. He preferred a strategy similar to that used in the Afghan war, in which the U.S. would insert SOF (Special Operations Forces), along with some two divisions, to assist native Kurdish and Shi'ite rebels, much as the United States had done with the Northern Alliance against the Taliban.[12]

Iraq policy and Bush criticism[edit]

The Senate Intelligence Committee eventually discovered that President Bush and his advisers heavily exaggerated[*citation needed*]the claims of weapons of mass destruction in Iraq and terrorist ties to Al Qaeda which were not validated by U.S. intelligence units.[2] Since this scandal, Perle has made several attempts to reduce his alleged involvement in the war efforts stating: "Huge mistakes were made, and I want to be very clear on this: They were not made by neoconservatives, who had almost no voice in what happened ..."[2] In an interview he gave *Vanity Fair* that was excerpted in an article appearing in the 4 November 2006 *Los Angeles Times*, he denied having a role in the planning of the war. He is reported to have told *Vanity Fair*, "I'm getting damn tired of being described as an architect of the war." This is not congruent with his signing of the PNAC letter in 1998. "I was in favor of bringing down Saddam. Nobody said, 'Go design the campaign to do that.' I had no responsibility for that." The same *Los Angeles Times* article reports that Perle now believes that his advocacy of the Iraq war was wrong.

Perle expressed regret of his support of the invasion and faulted the "dysfunction" in the Bush administration for the troubled occupation. "I think now I probably would have said, 'Let's consider other strategies for dealing with the thing that concerns us most, which is Saddam supplying weapons of mass destruction to terrorists'. The decisions did not get made that should have been. They didn't get made in a timely fashion, and the differences were argued out endlessly. At the end of the day, you have to hold the president responsible."[13][14][15] Nevertheless, Perle vociferously defended the war in Iraq, arguing to the wife of a deployed soldier in a 2007 PBS film that to end the war now would be to dishonor those who had already died in the cause.[16]

Disputed role in Bush Administration[edit]

Conservative commentator David Brooks has said that, in his opinion, Perle's influence in the Bush administration is exaggerated. In a 2004 *New York Times* article, Brooks wrote that; "There have been hundreds of references ... to Richard Perle's insidious power over administration policy, but I've been told by senior administration officials that he has had no significant meetings with Bush or Cheney since they assumed office. If he's shaping their decisions, he must be microwaving his ideas into their fillings".[17]

On Iraq Study Group proposals[edit]

In a December 2006 interview with *Die Zeit*, Perle strongly criticized the Iraq Study Group proposals, saying: "I have never seen such a foolish report. ... A report that begins with false premises ends with nothing."[18]

Other views on foreign policy[edit]

United Nations[edit]

Perle is a frequent critic of the United Nations, stating that it is an embodiment of "... the liberal conceit of safety through international law administered by international institutions. ... "[19] He has also attacked the United Nations Security Council veto power as a flawed concept, arguing that the only time the U.N. utilized force during the Cold War was when "... the Soviets were not in the chamber to veto it".[19]

Furthermore, shortly after the invasion of Iraq, Perle stated that; "in this case international law stood in the way of doing the right thing".[20] He also argued that there was "no practical mechanism consistent with the rules of the UN for dealing with Saddam Hussein". At the time, these comments provoked controversy among critics of the war, who argued that they contradicted the U.S.'s official stance on the legality of the invasion.[20]

Israel[edit]

In 1996 during the Clinton administration, Perle lead a study group with David Wurmser that produced a report on balancing power in the Middle East, specifically in Israel's favor.[2] The report, "A Clean Break: A New Strategy for Securing the Realm" made clear recommendations about steering Israel away from Socialist principles, making efforts to become more self-reliant, "nurturing alternatives to Arafat's exclusive grip on Palestinian society", and working more closely with countries such as Jordan and Turkey. It also stated the removal of Saddam Hussein from power in Iraq should be a key objective for the Israeli state, advocated armed incursions into Lebanon, and suggested Arab states should be challenged as undemocratic. Moreover, Perle personally delivered the report to the incoming Likud-led government in hopes of influencing the new Prime Minister Benjamin Netanyahu.

Defense[edit]

Perle advocates pre-emptive strikes, such as in Iraq, as an extension of America's right to self-defense. For example, Perle has expressed support for a theoretical first strike on North Korean and Iranian nuclear facilities.[21]

Business interests and controversies[edit]

Bribery accusations and alleged conflicts of interest[edit]

Perle has on occasion been accused of being an Israeli agent of influence. It has been reported that, while he was working for Jackson, "An FBI summary of a 1970 wiretap recorded Perle discussing classified information with someone at the Israeli embassy. He came under fire in 1983 when newspapers reported he received substantial payments to represent the interests of an Israeli weapons company. Perle denied conflict of interest, insisting that, although he received payment for these services after he had assumed his position in the Defense Department, he was between government jobs when he worked for the Israeli firm."[22]

From 1981 to 1987, Perle was Assistant Secretary of Defense for international security policy in the Reagan administration. In a *New York Times* article, Perle was criticized for recommending that the Army purchase an armaments system from an Israeli company that a year earlier had paid him $50,000 in consulting fees. Perle acknowledged receiving the payment the same month he joined the Reagan administration, but said the payment was for work done before joining the government and that he had informed the Army of this prior consulting work. Perle was never indicted for anything related to the incident.[23][24]

In March 2004, another *New York Times* article reported that, while chairman of the Defense Policy Board, Perle had contracted with the troubled telecommunications giant Global Crossing to help overcome opposition from the FBI and the Pentagon to the sale of its assets to Hong Kong-based Hutchison Whampoa. Since the military employed the company's fiber optics network for communications, the brass argued that sale to a foreign-owned, especially Chinese, corporation would compromise national security. Perle was to be paid $125,000 to promote the deal, with an extra $600,000 contingent fee on its approval.[25] This controversy led to accusations of bribery, and Perle resigned as chairman on March 27, 2003, though he remained on the board.[26]

Perle is also known to have demanded payment for press interviews[27] while he was the chairman of the Defense Policy Board, a practice that has raised accusations of not only ethical but legal impropriety.[28]

Unresolved legal issues[edit]

In 1978, while working with the Senate Armed Services Committee, Perle was caught in a security breach[*citation needed*] by CIA director Stansfield Turner.[2] Although Turner urged Senator Jackson to fire him, Perle received a warning and was kept on staff according to the *Washington Post*.

Perle has served as a Director of Hollinger International since June 1994. He is also Co-Chairman of Hollinger Digital Inc. and a Director of Jerusalem Post, both of which are subsidiaries of the company. He has served as a director of GeoBiotics. On August 31, 2004, a special committee of the Board of Directors investigating the alleged misconduct of the controlling shareholders of Hollinger International submitted the 512-page Breeden Report to the U.S. Securities and Exchange Commission (SEC). In the report, Perle is singled out as having breached his fiduciary responsibilities as a company director by authorizing several controversial transactions which diverted the company's net profit from the shareholders to the accounts of various executives. Perle received over $3 million in bonuses on top of his salary, bringing the total to $5.4 million, and the investigating committee called for him to return the money.

Top Hollinger executives dismissed the report and have filed a defamation lawsuit against the head of the investigating committee, former SEC chairman Richard C. Breeden. However, in 2005, Perle publicly acknowledged he had been served a 'Wells notice',[29] a formal warning that the S.E.C.'s enforcement staff had found sufficient evidence of wrongdoing to bring a civil lawsuit.

Seymour Hersh and "Lunch with the Chairman"[edit]

In July 2001, George W. Bush appointed Perle chairman of the Defense Policy Board Advisory Committee, which advises the Department of Defense. Two years later a newspaper article accused Perle of a conflict of interest, claiming Perle stood to profit financially by influencing government policy. The article alleged that Perle had business dealings with Saudi investors and linked him to the intelligence-related computer firm Trireme Partners LLP, which he claimed stood to profit from the war in Iraq.[30]

That same day, Perle was being interviewed on the issue of Iraq by CNN's Wolf Blitzer. Shortly before the interview ended, Blitzer quoted the aforementioned news article and asked for Perle's response. Perle dismissed the premise of the article and argued that it lacked "any consistent theme". Added Perle: "Sy Hersh is the closest thing American journalism has to a terrorist, frankly."[31]

On March 11, Perle told the *New York Sun* as regards Hersh's article that "I intend to launch legal action in the United Kingdom. I'm talking to Queen's Counsel right now".[32] He claimed it was easier to win libel cases in England, and that therefore made it a better location. In the end, Perle did not file any legal case. Instead, on March 27, 2003, he resigned as chairman of the Defense Policy Board, although he still remained a member of the board.[*citation needed*]

Adviser to Muammar al-Gaddafi[edit]

As a member of the Cambridge, Massachusetts-based consulting firm Monitor Group, Perle was an advisor to Libyan dictator Muammar al-Gaddafi in 2006.[33] "Perle traveled to Libya twice in 2006 and met with Vice President Dick Cheney after the trips."[34] According to Monitor documents, Perle traveled to Libya with several other advisers to hold lectures and workshops, and promote the image of Libya and its ruler.[33]

Iraq oil deal[edit]

In July 2008, *The Wall Street Journal* reported that Perle had made plans to invest in oil interests in Iraq, in collaboration with Iraqi Kurdish leaders in northern Iraq (Iraqi Kurdistan).[35]

Works[edit]

Perle is author of many articles and three books:

- *An End to Evil: How to Win the War on Terror* (with David Frum, 2003) ISBN 1-4000-6194-6
- *Hard Line* (1992) (ISBN 0-394-56552-5)
- *Reshaping Western Security* (ed.) (1991) (ISBN 0-8447-3790-9)

In 1992 he produced the PBS feature *The Gulf Crisis: The Road to War*.

In 2007, Perle presented the documentary "The Case for War: In Defense of Freedom", articulating his view of the challenges facing the U.S. after 9/11, and debating with his critics including Richard Holbrooke, Simon Jenkins, and Abdel Bari Atwan. The film was broadcast by PBS in their series *America at a Crossroads*, which generated considerable controversy.[36]

Richard Perle, a former resident fellow at the American Enterprise Institute and adviser to various Republican administrations, is widely considered a core representative of the neoconservative political faction. He has played a key role promoting militaristic U.S. foreign policies since the 1970s, first as an adviser to the late Sen. Henry Jackson, later as a Defense Department official in the Reagan administration, and then as head of the George W. Bush administration's Defense Policy Board during the launching of the "war on terror." More recently he has been a high-profile advocate of using military force to halt Iran's alleged nuclear weapons program and has opposed the nuclear deal reached between Iran and world powers in July 2015.

From Iraq to Iran

Since stepping down from his post as chair of the Bush administration's Defense Policy Board in 2003, Perle has generally kept a low public profile, while at times offering contradictory public evaluations of the Iraq War and urging U.S. military action in other Middle Eastern countries.

In early 2013, Perle served as a representative of the Clarion Project—a controversial advocacy group that has produced several Islamophobic and anti-Iranian films—in its efforts to capitalize on the Boston marathon bombings to promote its political agenda. Claiming that "jihadist ideology continues to motivate a sophisticated worldwide terror network and that America remains a target," Clarion urged the public to view its 2008 film, *The Third Jihad*, and offered Perle and Clare Lopezfor interviews.[1] The press release, according to the Inter Press Service, appeared to suggest that "Perle, a long-time member of the strongly pro-Chechen, anti-Russian American Committee for Peace in the Caucasus (formerly the American Committee for Peace in Chechnya) and many, many other neo-con letterhead organizations, has now associated himself in some way with the ultra-Islamophobic Clarion Project."[2]

Previously, Perle broke with many of his fellow neoconservatives in expressing regret about the U.S. occupation of Iraq. However, since the election of President Barack Obama, Perle has become an increasingly vocal critic of the U.S. foreign policy and become a high profile proponent of attacking Iran.

In a 2011 interview with the conservative outlet Newsmax.com, Perle said: "The Iranians are killing Americans at every opportunity in the places where we're now fighting. They support terrorism around the world, and they're headed toward nuclear weapons. … I think Obama believes wrongly that he can talk the Iranians out of their nuclear weapons program. He's been trying to do that since he became president. The previous administration tried it too. It isn't going to work."[3]

Perle was strongly critical of the Obama administration's diplomatic efforts to resolve the Iranian nuclear crisis and claimed after an agreement was struck between Iran and six world powers in July 2015: "[T]he likelihood of a crash landing is significant."[4]

In the months preceding the deal, Perle voiced support for Israeli Prime Minister Benjamin Netanyahu's stance on the negotiations and praised his controversial March 2015 address to the U.S. Congress criticizing the Obama White House's diplomacy. "He made a compelling case for not rushing into an agreement that is flawed in so many ways," Perle said of Netanyahu after the speech.[5]

Perle has also echoed Netanyahu's hyper-alarmist rhetoric that the nuclear deal with Iran could lead to genocide, telling *Newsmax* in March 2015: "Never again should the potential for genocide be allowed and that means taking action before for it's too late. And that means not entering into an agreements that predictably will place the most lethal weapons in the hands of the most dangerous enemies."[6]

In May 2013, Perle argued that instead of Obama's diplomatic approach to resolving the Iran nuclear dispute, the United States should have pushed for regime change in Iran and fostered unrest in the country. "I see no conflict between the two objectives of halting Iran's nuclear weapon ambitions and greater individual freedom for the Iranian people: both objectives can be achieved only when the current regime is removed, and it is that removal that should be the principal purpose of our policies, including sanctions. Sanctions that aim to change the minds of the mullahs will not work but sanctions that aim to undermine the power of the mullahs by encouraging the internal opposition just might," he said in an interview with *Open Canada*.[7]

Perle added: "[T]he sanctions would have to be far more onerous than those in effect today. And we would have to find ways, overt and covert, to support the opposition. The Obama administration shows no interest in such a strategy – or any strategy."[8]

When asked during an interview with Russia Today whether his views on Iran should be considered legitimate given the errors in judgment on Iraq, Perle responded defensively, stating: "What are you suggesting? That we stop trying to figure out whether Iran has nuclear weapons, because there were intelligence errors with respect to Iraq? Should the U.S. dismantle its intelligence organizations? Of course not!"[9]

Like many of his colleagues in the rightwing "pro-Israel" community, Perle has expressed concern about the emergence of conservative Muslim parties since the "Arab Spring," particularly the Muslim Brotherhood in Egypt. He told Newsmax in 2011: "The Muslim Brotherhood is potentially a very serious problem, since it is committed to the global expansion of an extreme approach to Islam, which is strict shariah law. And it will be very difficult if the Muslim Brotherhood comes to power."[10]

Reviving arguments he used during the 1970s and 1980s to promote extravagant weapons programs to deter the Soviet Union, Perle has criticized the Obama administration's arms control negotiations with Russia. In a 2010 op-ed for the *American Interest*, he wrote: "Obama's approach to Moscow smacks of appeasement, an eagerness to accommodate unreasonable Russian positions made worse by an exaggerated focus on refurbishing the antique arms control arrangements of the Cold War while embracing a utopian vision of a world without nuclear weapons."[11]

Perle has characterized the Obama administration's foreign policy as naïve and ill-informed, while at the same time using right-wing scare tactics in an effort to delegitimize the president. "What if," Perle wondered, "we are witnessing the deliberate, measured implementation of a deeply entrenched ideology reflecting such influences as the scarcely acknowledged Bill Ayers and the once inconveniently visible Reverend Jeremiah Wright? What if they shaped Obama's worldview in the years when they were ministering to and counseling a young, charismatic politician? Americans have never been tempted to elect a 'blame America first' President,' and now they are 'not so sure' about Obama."[12]

Iraq War Advocacy and Reversal

Iraq War Advocacy and Reversal

Perle's role in promoting the invasion of Iraq centered largely on his capacity as chair of the Pentagon's Defense Policy Board, which serves as a quasi-idea factory for the Defense Department. Paralleling the efforts of the Project for the New American Century (PNAC), a leading neoconservative advocacy group with which Perle was associated, as well as those of then-Pentagon number two Paul Wolfowitz, Perle convened a meeting of the DPB shortly after the attacks to produce policy responses for the administration. Perle invited as a guest to one of the board's classified meeting Ahmed Chalabi, the Iraqi exile and longtime confidant of Perle who served as the head of the Iraqi National Congress, which had for years been pushing for regime change in Iraq.

Although the DPB typically has little or no influence in setting policy, many commentators saw Perle's efforts as part of a larger, neoconservative-led initiative to coordinate public pressure from both inside and outside the administration. Commenting on this apparent coordination, Jim Lobe and Michael Flynn wrote: "It appears that after 9/11, the network of hawks and neoconservatives that had coalesced around PNAC's founding agenda had mobilized in a highly coordinated way to fashion the administration's response to the terrorist attacks and rally the public behind their new agenda" (see the Right Web special report, "The Rise and Decline of the Neoconservatives," November 17, 2006).

In late 2006, as the U.S.-led war in Iraq devolved into an increasingly bloody counterinsurgency campaign, Perle became a high profile turncoat with respect to the decision to invade Iraq. In a widely noted interview with *Vanity Fair* that year, Perle argued that the war in Iraq had turned out to be a mistake. He said: "I think if I had been delphic, and had seen where we are today, and people had said, 'Should we go into Iraq?,' I think now I probably would have said, 'No, let's consider other strategies for dealing with the thing that concerns us most, which is Saddam supplying weapons of mass destruction to terrorists.' … I don't say that because I no longer believe that Saddam had the capability to produce weapons of mass destruction, or that he was not in contact with terrorists. I believe those two premises were both correct. Could we have managed that threat by means other than a direct military intervention? Well, maybe we could have."[13]

Responding to Perle's change of heart, Gary Schmitt, a founder of PNAC and Perle's colleague at the American Enterprise Institute (AEI), told the BBC: "I do not agree with Richard Perle that we should never have gone in. I do argue that the execution should have been better. In fact, I argued in late 2003 that we needed more troops and a proper counterinsurgency policy."[14]

Also in seeming opposition to other neoconservatives, Perle gave an equivocal reaction to the controversial decision by President George W. Bush in early 2007 to "surge" the number of troops in Iraq. While most neoconservatives were supportive of the surge plan, even eager for a larger commitment than 20,000 additional troops proposed, Perle expressed doubt that sending more troops was the answer. He told the *New York Sun*, "I don't think the additional troops are the key to the strategy [Bush] has announced, it is how effectively those troops are managed." He added: "The big question in my mind is whether we can implement some practical and prudent measures. I don't know if we can. It will depend significantly on the command in the country."[15]

Perle later claimed that his remarks about the invasion had been taken out of context, insisting that he had actually meant to criticize the U.S. occupation and administration of the country. "The mistake in my view—and I can't prove this; nobody can prove this—the seminal mistake was getting into an occupation and not turning things over to the Iraqis," he said. "I doubt that they would have handled the postwar situation as badly as we did. We sent thousands of Americans over there to run a country they knew nothing about." He added, " I think the decision that was made to remove Saddam was right." [16]

In June 2014, Perle blamed the Iraq War on faulty intelligence about Saddam Hussein's alleged weapons of mass destruction. "We were not doing it to bring democracy to Iraq, we were not doing it as he has sometimes suggested on behalf of any other government. We believed the intelligence that was available at the time that the CIA and other intelligence organizations . . . that Saddam [Hussein] had weapons of mass destruction and there was a danger after 9/11 that he would share those weapons," he stated.[17]

One commentator said in response: "Perle, who was known for his nickname 'Prince of Darkness,' is slyly presenting himself as an innocent, if not gullible average American who too was misled by false intelligence."[18]

After the conquest of large parts of Iraq by the self-proclaimed "Islamic State" group (ISIS) in 2014, Perle argued that Chalabi should have replaced Nouri al-Maliki as Iraq's prime minister. He told the *National Review* in July 2014: "Chalabi is far and away the most competent and the most capable of salvaging this situation. I think he's got the best chance. It would be foolish if we expressed a preference for somebody less competent, which we've done before."[19]

Worldview

Perle's pessimism on Iraq stood in stark contrast to his trademark hard-nosed militarism, which has been a staple of his rhetoric for more than two decades. Reflecting core aspects of what many regard as the neoconservative worldview, Perle's discourse typically reflects a combination of warrior worship, existential conflict, and extreme moral righteousness. As the Australian journalist John Pilger reported shortly before the war in Iraq: "One of George W. Bush's 'thinkers' is Richard Perle. I interviewed Perle when he was advising Reagan; and when he spoke about 'total war,' I mistakenly dismissed him as mad. He recently used the term again in describing America's 'war on terror.' 'No stages,' he said. 'This is total war. We are fighting a variety of enemies. There are lots of them out there. All this talk about first we are going to do Afghanistan, then we will do Iraq … this is entirely the wrong way to go about it. If we just let our vision of the world go forth, and we embrace it entirely and we don't try to piece together clever diplomacy, but just wage a total war … our children will sing great songs about us years from now.'"[20]

Like many neoconservatives, Perle seems to have been particularly influenced by his views of the Holocaust, a theme that has repeatedly popped up in his rhetoric. Said Perle in a 2003 interview with BBC: "For those of us who are involved in foreign and defense policy today, my generation, the defining moment of our history was certainly the Holocaust. It was the destruction, the genocide of a whole people, and it was the failure to respond in a timely fashion to a threat that was clearly gathering. We don't want that to happen again; when we have the ability to stop totalitarian regimes we should do so, because when we fail to do so, the results are catastrophic."[21] Similarly, in his 2004 book *An End to Evil*, he and coauthor David Frum argued: "For us, terrorism remains the great evil of our time, and the war against this evil, our generation's great cause … There is no middle way for Americans: It is victory or holocaust."[22]

Perle has denounced the use of the term "neoconservative" and has claimed that it is used by "hateful critics" to refer to Jewish Americans. "It's often used to describe Jewish Americans because, as it happens, some of the original thinkers whose ideas have now been characterized by this general term 'neoconservative' were in fact Jewish, and it often carries conspiratorial tones on the part of people who throw the term around," he told *Newsmax* June 2014.[23]

Prescriptions on the Middle East

This radical outlook on foreign affairs deeply influenced both Perle's reaction to 9/11 and his initial response to the growing turmoil in the Middle East in the wake of the U.S. invasion of Iraq. For example, despite the growing violence in Iraq by late 2005, Perle remained committed to a larger "regime change"

strategy for the Middle East that included both Syria and Iran. On Syria, Perle hosted meetings in late 2005 between Chalabi and Syrian exile Farid Ghadry, who was head of the Syrian Reform Party. Ghadry told the Wall Street Journal: "[Chalabi] paved the way in Iraq for what we want to do in Syria." Said Perle: "There's no reason to think engagement with Syria will bring about any change," adding that Syrian President Bashar al-Assad "has never been weaker, and we should take advantage of that."[24]

On Iran, Perle lambasted the State Department and then-Secretary of State Condoleezza Rice for being weak on the "mullahs." In a July 21, 2006 piece for AEI, Perle contended that the offer of negotiations with Iran over its nuclear program amounted to "appeasement." He wrote: "Proximity is critical in politics and policy. And the geography of this administration has changed. Condoleezza Rice has moved from the White House to Foggy Bottom, a mere mile or so away. What matters is not that she is further removed from the Oval Office; Rice's influence on the president is undiminished. It is, rather, that she is now in the midst of—and increasingly represents—a diplomatic establishment that is driven to accommodate its allies even when (or, it seems, especially when) such allies counsel the appeasement of our adversaries."[25]

During the summer 2006 conflict in Lebanon, Perle also remained on message, arguing that Israel was involved in an "existential struggle" with Hezbollah. In an op-ed for the *New York Times*, Perle wrote: "Israel must now deal a blow of such magnitude to those who would destroy it as to leave no doubt that its earlier policy of acquiescence is over. This means precise military action against Hezbollah and its infrastructure in Lebanon and Syria, for as long as it takes and without regard to mindless diplomatic blather about proportionality. For what appears to some to be a disproportionate response to small incursions and kidnappings is, in fact, an entirely appropriate response to the existential struggle in which Israel is now engaged."[26]

Perle has for decades supported the work of a number of hardline think tanks and advocacy groups, including the Committee on the Present Danger, PNAC, EI, the Jewish Institute for National Security Affairs, and the Hudson Institute. As of 2015, he is a member of the board of advisors of the Center for Security Policy and the Washington Institute for Near East Policy.[27]

In 1996, Perle participated in a study group that produced a report for the incoming Likud-led government of Israeli Prime Minister Benjamin Netanyahu that urged the country to break off then-ongoing peace initiatives and suggested strategies for reshaping the Middle East. Among the group's arguments was the idea that "removing Saddam Hussein from power in Iraq [was] an important Israeli strategic objective in its own right." The report—titled "A Clean Break: A New Strategy for Securing the Realm" and coauthored by Douglas Feith, David Wurmser, and Meyrav Wurmser—also recommended working closely with "Turkey and Jordan to contain, destabilize, and roll back" regional threats and using "Israeli proxy forces" based in Lebanon for "striking Syrian military targets in Lebanon." If that should "prove insufficient, [Israel should strike] at select targets in Syria proper." Further, "Israel can shape its strategic environment, in cooperation with Turkey and Jordan, by weakening, containing, even rolling back Syria." This would create a "natural axis" between Israel, Jordan, a Hashemite Iraq, and Turkey that "would squeeze and detach Syria from the Saudi Peninsula." This "could be the prelude to a redrawing of the map of the Middle East, which could threaten Syria's territorial integrity."[28]

In 1998, Perle signed a PNAC letter to President Bill Clinton that argued, "Current American policy toward Iraq is not succeeding, and that we may soon face a threat in the Middle East more serious than any we have known since the end of the Cold War." The threat from Iraq was characterized as being of such a magnitude that the "only acceptable strategy is one that eliminates the possibility that Iraq will be able to use or threaten to use weapons of mass destruction. In the near term, this means a willingness to undertake military action as diplomacy is clearly failing. In the long term, it means removing Saddam Hussein and his regime from power." Other signatories included future Bush administration officials Elliott Abrams, Richard Armitage, John Bolton, Zalmay Khalilzad, Peter Rodman, Robert Zoellick, Donald Rumsfeld, and Wolfowitz.

In 2001, Perle also signed the now notorious post-9/11 PNAC letter to President Bush arguing that "even if evidence does not link Iraq directly to the attack, any strategy aiming at the eradication of terrorism and its sponsors must include a determined effort to remove Saddam Hussein from power in Iraq. Failure to undertake such an effort will constitute an early and perhaps decisive surrender in the war on international terrorism. The United States must therefore provide full military and financial support to the Iraqi opposition. American military force should be used to provide a 'safe zone' in Iraq from which the opposition can operate. And American forces must be prepared to back up our commitment to the Iraqi opposition by all necessary means."

Private-Sector Controversies

Perle has been heavily criticized for his sometimes-questionable business interests, which have been the focus of several investigative reports by journalists. When the *New Yorker*'s Seymour Hersh documented Perle's business dealings in the Middle East with the venture capital firm Trireme, Perle threatened to sue the journalist, saying that he was the "the closest thing American journalism has to a terrorist."[29]

Hersh's article, "Lunch with the Chairman," discussed possible conflicts of interest resulting from Perle's dual role as chairman of the Defense Policy Board and as a partner for Trireme, a company that invests in homeland security and defense-related industries. Hersh recounted how Perle met with Adnan Khashoggi, a Saudi arms dealer, and another Saudi businessman in early 2003. Various people interviewed by Hersh, including Khashoggi, indicated that Perle and Trireme seemed to be sending the message that in return for Saudi investment backing, the "Chairman" would use his Pentagon connections to influence U.S. policy.[30]

Soon after the Hersh piece was published, columnist Maureen Dowd and other journalists documented Perle's relationship to Global Crossings, a bankrupt communications giant and defense contractor that was seeking Pentagon permission to be sold to the Asian company Hutchinson Wampoa (the same Hutchinson Wampoa whose interests in Panama sparked an anguished round of right-wing hand-wringing about a Chinese attempt to take control of the Panama Canal). Although Perle denied any wrongdoing, he admitted through his attorney that he was hired by Global Crossings to consult with a reluctant Department of Defense about the deal.[31]

In late March 2003, Perle announced that he was stepping down from his post as chairman of the Defense Policy Board, writing in his resignation letter to Rumsfeld: "I have seen controversies like this before and I know that this one will inevitably distract from the urgent challenge in which you are now engaged. I would not wish to cause even a moment's distraction from that challenge. As I cannot quickly or easily quell criticism of me based on errors of fact concerning my activities, the least I can do under these circumstances is to ask you to accept my resignation as chairman of the Defense Policy Board."[32]

Apparently undeterred, however, Perle continued to make eyebrow-raising business arrangements, particularly in the Middle East. In 2008, the *Wall Street Journal* reported that Perle was exploring investing in oil interests in Iraq and Kazakhstan, a curious decision given the salient claims by Iraq war opponents that the war was waged over access to Iraq's oil.[33] Perhaps more surprisingly, *Politico* reported in 2011 that Perle also twice traveled to Libya with the Monitor Group, a consulting firm that named Perle a senior adviser in 2006, as part of an effort to "burnish Libya's and [then-dictator Muammar] Qadhafi's image" in the United States.[34]

Acquired by Triumph-Adler

Predecessor

Peripheral Equipment Corporation

Headquarters

Chatsworth, California, United States

Pertec Computer Corporation (**PCC**), formerly **Peripheral Equipment Corporation** (**PEC**), was a computer company based in Chatsworth, California which originally designed and manufactured peripherals such as floppy drives, tape drives, instrumentation control and other hardware for computers.[1]

Pertec's most successful products were hard disk drives and tape drives, which were sold as OEM to the top computer manufacturers, including IBM, Siemens and DEC. Pertec manufactured multiple models of seven and nine track half-inch tape drives with densities 800CPI (NRZI) and 1600CPI (PE) and phase-encoding formatters, which were used by a myriad of original equipment manufacturers as I/O devices for their product lines.

In the 1970s, Pertec entered the computer industry through several acquisitions of computer producers and started manufacturing and marketing mostly minicomputers for data processing and pre-processing. This split up Pertec into two companies. Pertec Peripherals Corporation (PPC), which remained based in Chatsworth, California, and Pertec Computer Corporation (PCC), which was located at 17112 Armstrong Avenue, in Irvine, California.

Pertec and MITS[edit]

Close up of the Altair 8800B. Currently on display at the Living Computer Museum in Seattle, Washington.

Pertec bought MITS, the manufacturers of the MITS Altair computer, for US$6.5 million in 1976. This purchase was motivated mainly by the ownership of the Microsoft BASIC sources and general license that Pertec erroneously assumed to be included in the deal. They also acquired iCOM, makers of micro peripherals, in the same year. They believed that these acquisitions would change them from selling computers mostly for hobbyists, to selling them for small businesses.[2]

Pertec changed their name, after the acquisition of MITS, from Pertec Corporation to Pertec Computer Corporation to "be more reflective of the company's present position and to clearly state our future direction".[3]

As a result of the acquisition, Pertec became involved in the manufacturing of microprocessor-based computers. Their first models were expanded versions of the Altair models, typically coupled to the existing disk-drive range.[4] Despite initially good sales, the Altair's 8080CPU was becoming increasingly outdated, so Pertec decided to retire the Altair as well as the MITS name itself.

In 1978, the company launched the first of its own designs, the PCC-2000.[5] This was based on two Intel 8085 series microprocessors: one of which was given over to I/O control. Being a high end machine, it was intended to be the core of what would now be described as a workgroup. The machine was

intended to support four "dumb" terminals connected via RS-232 serial lines, in addition to its internal console. The basic machine had twin 8-inch floppy drives, each capable of storing 1.2 megabytes and could link to two Pertec twin 14-inch disk drives, giving a total of 22.4 megabytes of storage, which was a very large amount for the time. The system was generally supplied with a multi-user operating system called MTX, which included a BASIC interpreter that was similar to Business Basic. The PCC-2000 was also available with MITS DOS or CP/M. In the UK, several systems were run under BOS. Unfortunately, the PCC-2000 was too expensive for the market and was never a great success.

Pertec Business Systems[edit]

Pertec/MITS 300[edit]

Pertec/MITS 300/55 Business System. Currently on display at the Living Computer Museum in Seattle, Washington.

The MITS 300 was the first product built and released by the Pertec after their acquisition of MITS in 1977. They produced the 300/25 and the 300/55.[6] Both were fully integrated systems that included both hardware and software in one package.[7] The 300/25 used Pertec floppy diskette drives and the 300/55 added Pertec DC-3000 14-inch hard disk.[8] The system consists of the MITS 2nd generation Altair 8800 (or Altair 8800b) computer with hard drive controller and MITS datakeeper storage system. The complete 300/55 business system sold for $15,950 and included the Altair 8800b with 64k of dynamic RAM, a CRT terminal and a desk.[9] The system was designed to handle a variety of business applications including word processing, inventory control and accounting. This system was prone to overheating and had a very short life span.[10]

The new system allowed for MITS peripherals including Altair Floppy Disc, Altair Line Printer, Teletypewriter, and the Altair CRT terminal.[11] The printer was a bidirectional Mits/Altair C-700 that could print 60 characters/second and 26 lines/minute.[12]

Pertec PCC-2100[edit]

Pertec's primary line of computer products was aimed at the key-to-disk minicomputer systems that were used as front-end data processors for the IBM 360/370 and similar systems. This line was opened in the first half of the 1970s by the Pertec PCC-2100 data entry system, which was essentially different from the PCC-2000 mentioned above. The system was able to serve up to 16 coaxial terminals, two D3000 disk drives and one T1640 tape drive.

Pertec XL-40[edit]

Pertec XL-40, introduced in 1977, was a more successful successor of Pertec PCC-2100.[13] The XL-40 machine used custom 16-bit processors built from the TI3000 or AMD2900 slices, up to 512 KB operating memory and dedicated master-capable DMA controllers for tape units, floppy and rigid disk units, printers, card reader and terminals.

The maximum configuration came in two different versions. One featured four T1600 / T1800 tape units (manufactured by Pertec), two floppy disk units (manufactured by IBM or Pertec) and four D1400 / D3400 rigid disk units (4.4, 8.8, 17.6 MB formatted capacity, manufactured by Pertec or Kennedy). The other one featured two large capacity disk units (up to 70 MB formatted capacity, manufactured by Kennedy or NEC), one line printer connected through long-line interface (DataProducts LP600, LP1200, B300, Printronix P300, P600), four station printers connected through coaxial cable (Centronics), one card reader (Pertec), four SDLC communication channels and 30 proprietary coax terminals (Model 4141 with 40x12 characters or Model 4143 with 80x25 characters).

The system was mainly used for key-to-disk operations to replace the previously popular IBM card punches and more advanced key-to-tape systems manufactured for example by Mohawk Data Sciences (MDS) or Singer. In addition to the basic key-to-disk function, the proprietary operating system, called XLOS, supported indexed file operations for on-line transaction processing even with data journaling. The system was programmed in two different ways. The data entry was either described in several tables that specified the format of the input record with optional automatic data validation procedures or the indexed file operations were programmed in a special COBOL dialect with IDX and SEQ file support.

System maintenance operations were performed in a protected supervisor mode; the system supported batched operations in the supervisor mode through the use of batch files that specified operator selections. The operating system interacted with the user through a series of prompts with automatic on-screen explanations and default selections, probably the ultimate user-friendliness achievable in text-only human-computer interaction. The XL-40 was also marketed by Triumph-Adler in Europe as TA1540, the beginning of a relationship that would eventually see a merger of the two companies.

Pertec 3200[edit]

Pertec's final in-house computer design was a complete departure, the MC68000-based Series 3200.[14] The primary operating system was an in-house developed multi-tasking, multi-user operating system, but it could also run Unix. As with the XL40, Triumph-Adler marketed the system in Europe under their own brand with the model name MSX 3200 (There were four models, eventually, in the Triumph-Adler series: 3200, 3220, 3230 and 3240). The key to disk application from the XL40 was re-implemented on the 3200. The other main application was a BASIC language driven database, similar to the ones used by MAI Basic Four or Pick operating system. These BASIC database business systems would be purchased by outside companies that bundled the PCC 3200 with their software to provide a complete small business package (accounts payable, accounts receivable, payroll, inventory, sales tracking, taxes, etc.) customized for specific businesses.

The 3200 was extremely advanced for the time, being intended to support up to 32 users, all using intelligent Z80-based terminals, each of which could optionally run CP/M attached to the 3200's high speed coax cable. Later an ISA bus to 3200 coax interface was made for the PC, and this allowed the usage of PC's as smart terminals for the 3200 or as networked systems running MS-DOS. It was the first Pertec product to support the emerging "Winchester" standard for miniature hard disks.

Eventual fate[edit]

Soon after the introduction of the 3200, Pertec Computer Corporation was purchased by Triumph-Adler. Later PCC was acquired by Scan-Optics in February 1987.[15] During the transition from systems based on custom-made CPUs to CPUs made by Intel and Motorola, prices for these systems dropped dramatically, but without an offsetting increase in demand, and eventually companies such as PCC slowly dwindled away to small remnants of their peak days in the mid-1980s, or were bought out by larger companies.

Pertec's PPC magnetic tape interface standard of the early 1970s rapidly became an industry-wide standard and is still in use by tape drive manufacturers today.[16] Similarly, its PERTEC disk interface was an industry standard for pre-Winchester disk drives of the 1970s.

• MARKETING OPPORTUNITIES

APPLICATION ENGINEER

Opportunity for aggressive engineer desiring to get into marketing. Direct contact with customers, technical staff, to attain maximum utilization of equipment communicate customer requirements to our sales, engineering & development staff. Conduct application seminars for users personnel & sales reps. Moderate travel applicant must have BSEE & 2 yrs. in logic design & computer peripheral interface experience.

SALES ENGINEER

Establish & maintain contact with prospective & existing digital tape unit customers within an assigned sales territory in Orange County. Applicant should possess a BSEE, ME, math or physics + 4 years directly applicable experience.

INSIDE SALES ENGINEER

Provide administrative support to field engineers & serve as the focal point between field sales, customer request & the engineering & manufacturing staffs. Review customer orders, assist on quotations, contracts & delivery schedules. BS + 3 years computer peripheral experience.

FIELD SERVICE MANAGER

Establish the field service programs required for the installations, repair & maintenance of digital tape units thruout the domestic & international markets. BS + 2 years directly related experience or 2 years College + 4 years directly applicable experience.

• ENGINEERING OPPORTUNITIES

LAYOUT DRAFTSMAN

Prepare detail assembly & layout drawings & drawing list from other layouts, rough sketches & notes. Some PCB layout experience desired. Position will lead to PCB layout designer. Applicant should possess H.S. + 1 yr. technical training + 3 years directly related experience.

• MANUFACTURING OPPORTUNITIES

TEST TECHNICIAN

Perform functional & operational tests & trouble shoot computer peripheral equipment. Extensive working knowledge of digital electronics. H.S. + at least 2 years specialized technical training & 2 years directly applicable testing experience.

NEW CONSTRUCTION

West Valley Park Project Under Way

Construction has begun on two large industrial buildings at the 40-acre West Valley Industrial Park in Chatsworth.

A 36,000-square-foot building is being built for the Peripheral Equipment Corp. The second, 37,000-square-foot building is available for lease.

Jim McDonald of S. D. Herman Co., Inc., agents for the development, said the industrial park is expected to be fully constructed in about three years. A total of 675,000 square feet of manufacturing and warehouse space will be built at a projected cost of $5.4 million. The total value of land and buildings will exceed $8 million, he said.

It is expected that 25 to 30 industrial firms will locate in the project, resulting in the creation of 3,300 new jobs for the area. The projected annual payroll is expected to exceed $35 million annually.

West Valley Industrial Park faces De Soto Ave. and Lassen St., extending east of De Soto to Lurline Ave.

★

Acme General Corp. of Monrovia has completed negotiations for a new principal office and expanded manufacturing and warehouse facilities to be located on a 17-acre site in San Dimas.

The O.K. Earl Corp. of Pasadena assisted in locating and acquiring the site and has been selected to design, engineer and construct the project.

The first phase of the project will be a building of 130,000 square feet costing $2 million. The facility will be located at Arrow Highway and Walnut Ave. north of the Puddingstone recreational area.

Acme General is engaged in the design, manufacture and sale of sliding and folding door hardware system and accessories for the mobile home, residential and commercial construction industries.

Charterhouse Investment Co. has joined with Jack Randall and Victor Palmieri to build for lease a 126,000-square-foot industrial building at Conejo Blvd. and Teller Road in Conejo.

The structure will be divisible for multitenant or single-tenant occupancy. The contractor is Randall Engineering Co. Total cost of the project is estimated at $1.5 million.

a PERTEC company

PERIPHERAL EQUIPMENT CORPORATION SUPPLIES A COMPLETE LINE OF HIGH PERFORMANCE PERIPHERALS TO THE RAPIDLY EXPANDING COMMERCIAL MARKET OF SMALL COMPUTERS, DATA TERMINALS AND GENERAL PURPOSE DIGITAL SYSTEMS. NEW PRODUCT DEVELOPMENT PROGRAMS IN TAPE DRIVES, DISK DRIVES AND TAPE/DISK SUB-SYSTEMS HAVE CREATED SEVERAL OPENINGS IN OUR ENGINEERING DEPARTMENT.

THE FOLLOWING POSITIONS EXIST IN THE TAPE AREA:

TAPE, READ/WRITE ELECTRONIC DESIGN

Responsible for original circuit design of low level, low noise signal amplifiers and analog signal conditioning such as filtering and squaring as applied to digital or instrumentation magnetic recording.

Requires BSEE or MSEE and a minimum of 6 years electro/mechanical systems circuit design experience in tape transports with a strong analytical approach.

SYSTEM/LOGIC DESIGN ENGINEER

Responsible for system and logic design of computer peripheral subsystems and components on product development projects from conception through successful prototype evaluation.

Requires BSEE or MSEE and a minimum of 6 years experience in the design of digital systems, preferably in the computer peripheral area. Desire experience with digital magnetic tape interface and digital data communications using MSI technology.

LOGIC DESIGN ENGINEER

Responsible for logic design of computer peripheral devices including sequential control logic applying state of the art technology such as programmable logic arrays, read only memories, and random access memories.

Requires BSEE or MSEE and a minimum of 4 years experience in digital circuit design in the computer peripheral field with specific exposure to magnetic tape interfaces.

PROJECT ENGINEER

Responsible for the technical management of a tape transport development project from conception through successful prototype evaluation.

Requires BSEE or MSEE and a minimum or 2 years experience in the computer peripheral field including at least 3 years digital tape transport, electro/mechanical and servomechanism design experience.

LOGIC DESIGN ENGINEER

Responsible for detail logic design using standard IC's as well as MSI devices.

Requires BSME or MSEE and a minimum of 2 years experience in electronic logic design and transmission of digital signals using standard DTL and TTL logic.

MECHANICAL TAPE TRANSPORT ENGINEER

Responsible for sustaining engineering on released products including the review and/or solution of production oriented problems, product evaluation, product improvement and cost savings recommendations.

Requires BSME or MSME and a minimum of 4 years mechanical engineering design experience on magnetic tape transports or similar electro-mechanical devices. Should have experience with tape path guidance dynamics, motors, materials, design and drafting standards and machining practices.

MARKET SUPPORT ENGINEER

Responsible for providing the engineering support to the Marketing Department involving design improvement of tape transports and subsystems, specification review, application notes review, product evaluation, and customer support programs.

Requires BSEE or MSEE and a minimum of 3 years experience in circuit and/or electro/mechanical systems design of magnetic tape transports and the ability to interface with the customer.

THE FOLLOWING POSITIONS EXIST IN THE DISK AREA:

DISK ENGINEERING MANAGER

Responsible for directing the activities of a group of engineers in the development of small disk drives and disk sub-systems. Maintain the required levels for manpower & equipment necessary to ultimately achieve a position of technical leadership in the small disk field. Must be able to generate project budgets, schedules and specifications and then see that these goals are met. Participate in new product planning and interface with manufacturing to move new products into production. Provide technical support to marketing and manufacturing for units in production. Requires BSEE/ME or MSEE/ME and 6 to 10 years prior disk drive design experience. Experience as a project engineer on Electro-Mechanical computer peripheral devices required.

ELECTRONIC ENGINEER

Responsible for the design and development of high speed precision servomechanisms related to computer disk drives. Also development of associated circuits, amplifiers and power supplies.

Requires BSEE or MSEE and a minimum of 5 years analog circuit design experience.

SERVO DEVELOPMENT ENGINEER

Responsible for design and development of high speed precision servo systems related to computer peripheral equipment in the advance technology department. Requires MSEE and a minimum of 7 years experience in the design and detail analysis of high speed servomechanisms and related circuits. Must be familiar with state of the art devices and techniques. Should be familiar with application of digital computers to the simulation of servo systems.

MECHANICAL ENGINEER

Responsible for the design and development of precision mechanisms for computer disk drives.

Requires BSME or MSME and a minimum of 5 years experience in the development, design and analysis of high speed precision mechanisms. Must be familiar with applications of ball bearings, castings and motor drives.

LOGIC DESIGN ENGINEER

Responsible for the design of logic circuits necessary to control and interface peripheral equipment to computer systems. Requires BSEE or MSEE and a minimum of 5 years experience in logic design using IC's and MSI in the computer and peripheral subsystems field.

E/M DESIGN ENGINEER

Responsible for product improvement and design changes on released complex electro/mechanical products including the review and/or solution of production oriented problems, product evaluation, and cost savings programs.

Requires BSEE or MSEE and a minimum of 5 years experience with high speed electro/mechanical devices including 2 years direct experience in disk or tape drives. Should have a general background in analog and digital circuits with an understanding of servomechanisms.

MECHANICAL DEVELOPMENT ENGINEER

Responsible for development of high speed—low cost precision mechanisms for computer disk drives in the advance technology department. Requires MSME & minimum of 8 years experience in the design & analysis of high speed mechanisms. Must be familiar with the applications of ball bearings, plastics, castings, motor drives & have an understanding of servomechanisms.

Kurth Is Honored

To be honored at a banquet is Harold Kurth, 27310 Circle G Drive, Saugus, for having been named the Distinguished Alumnus for 1971 for the School of Science and Mathematics at California State Polytechnic College in San Luis Obispo.

Kurth is president of Peripheral Equipment Corporation of Chatsworth. The firm is a supplier to the computer science industry. Since obtaining a bachelor of science degree in physical science in 1959 at Cal Poly, Kurth has been involved in the development of data processing with a number of major concerns in the field.

In addition to being honored at a banquet hosted by Dr. Robert Kennedy, Cal Poly President, Kurth will be honored guest at the homecoming parade held next Saturday.

NEW synchronous digital magnetic tape transport by PERTEC, T8000, has proven success and is already back ordered, company spokesman said. Company has become major computer equipment supplier, he said.

PERTEC Established as Major Computer Supplier

PERTEC has established itself as a major supplier of computer related equipment throughout the world, a spokesman said.

The company's products are designed for use with low-cost computers, data entry and data output systems and do not compete for the IBM plug-to-plug compatible peripheral market.

PERTEC is the largest independent manufacturer of digital tape transports, the second largest manufacturer of key-to-tape data entry systems, and a significant factor in the computer output microfilm market, the spokesman said.

Company Expanded

Approximately one-half of PERTEC's products are being shipped to international markets.

PERTEC was formed in 1967 as Peripheral Equipment Corporation to design, manufacture and market low-cost computer peripheral equipment. Through development program, combined with a series of acquisitions, the company expanded its manufacturing and marketing capabilities.

The company had its first public stock offering in 1971, and at that time changed its name to PERTEC CORPORATION and reorganized into two divisions. Peripheral Equipment division, located in Chatsworth, and Business Systems division, located in Santa Ana.

During the last year, PERTEC has started production on two new major products: the T8000 series synchronous digital magnetic tape transport, and the D3000 series disk memory drive.

These products include the latest features in the industry and are already backlog ordered.

In two Chatsworth facilities approximately 450 employes design and manufacture of digital tape transports, disk drives, and impact printers.

At Santa Ana, approximately 250 employes design and manufacture data entry equipment and COM systems.

The company has a network of sales and service offices throughout the world.

PERTEC

PERTEC CORPORATION, headquartered in Los Angeles, with major manufacturing facilities in Chatsworth and Santa Ana, is the largest independent supplier of digital magnetic tape recorders, the second largest supplier of key-to-tape data entry systems, and an important factor in the disk drive and computer output microfilm markets.

Production was recently started on several new product lines. Other new products are expected to go into production by mid-year 1973.

Pertec Corp. named a new chief executive officer and president.

Ryal R. Poppa, 39, succeeds Frank A. Grisanti, head of a Los Angeles management consulting firm, who-has been Pertec's acting president and chief executive since December, 1972. Grisanti took the temporary job at that time following a management dispute which resulted in the resignation of Pertec's president, Harold A. Kruth. Poppa had been executive vice president for domestic operations of Mohawk Data Sciences Corp. Pertec, based in Los Angeles, manufacturers a variety of computer equipment.

THE AGE OF ALTAIR (DAVID BUNNELL & EDDIE CURRIE) - The Grand and Glorious Crusade - Part 4

NOTE : It was Poppa of Pertec that decided to buy MITS

"The personal computer traces its roots back to the Altair computer, first manufactured in January 1975 by MITS, Inc., a small company that came from the desert sands of Albuquerque, New Mexico. For the next 2½ years, MITS, Inc. so dominated this new-found market that the company literally defined personal computing. David Bunnell and Eddie Currie were both uniquely involved in the beginning of personal computing as MITS vice presidents. Together in this exclusive PC series they tell the story of The Age of Altair."

While taking on all the characteristics of a classic crusade, the early days of Altair were nerve-racking, hectic, and frustrating. MITS was bringing computers to the masses, and the demand for microcomputers seemed unquenchable. The staff worked long hours, 7 days a week, of ten for no more than minimum wage. It wasn't at all unusual to find 20 or 30 people at MITS any hiur of the day or night. While conducting atour of MITS, President Ed Roberts found himself stepping over the sleeping body of a staff member in the software department. The body was that of Bill Gates, co-founder of Microsoft.

What's It Called?

When the first Altair was completed. it was packed up and shipped off to New York to Popular Electronics Technical editor Les Solomon. Les was to use it in preparing a feature article for the January 1975 issue. The first Altair was lost in transit, and a second machine had to be frantically configured and rapidly dispatched northeast. A contest at MITS had failed to produce a suitable name for this machine, Les Solomon was given the task of arriving at an appropriate appelation. While discu1ssing possibilities with family over dinner. his daughter suggested "Altair." It [--??-] that the good ship Enterprise, beloved among Trekies, was winging its way to the star Altair on television that night.

After considerable confusion, Altair became more well known than MITS. Many people assumed that the Altair was produced by an Albuquerque company named Altair. Almost no one knew what MITS stood for. Rumors indicated it meant "man in the street," which had some credibility because MITS had made it possible for many to own their own computers. MITS was actually a mnemonic for Micro Instrumentation and Telemetry Systems. It was the remaining artifact of an earlier Roberts' venture to produce telemetry equipment for model rockets.

The Age of Altair ushered in an information hunger explosion. Microcomputer clubs formed rapidly. It was not unusual to encounter groups without computers of any kind. They met regularly to discuss magazine articles, advertisements, and friends of friends who had ordered their own micros. The Southern California Computer Society (SCCS) grew so fast it once predicted that within 2 years every man, woman, and child on the face of the earth would be an SCCS member.

Books, magazines, and pamphlets sold out the instant they appeared at computer stores. One of the most interesting early publications was Computer Liberation by Ted Nelson. A collection of letters, articles, and drawings, it is a fascinating compendium of the state of computerdom in the mid-1970s. MITS produced its own publication, Computer ores, with David Bunnell as editor. The first issue appeared in April 1975 and was soon to develop a large following. Ultimately it came to an abrupt and ignoble end.

The MITS-Mobile, a van equipped with a complete Altair system was pressed into service as a traveling road show. It was an instant success, beginning with a trip to Texas in late April and then the rest of the United States. Response was overwhelming. People would often foil ow the van from one site to another to attend the computer seminar given by the "MITS-Boys," in spite of the fact that seminars were often several hundred miles apart. Although seminar admission was $9.75, the program was such a success devotees paid the expenses. Taken to the National Computer Conference (NCC) in May 1975, the van was presented as the .. ultimate recreational vehicle."

Altairs For Sale

The first retail computer store, an Altair store, was an offshoot of Arrowhead Computer, started by Dick Heiser in West Los Angeles. This new venture, dubbed .. The Computer Store," offered the Altair for a kit price of $439 while Intel offered the 8080 microcomputer chip for $350 in single quantities.

Ed Roberts, creator of the Altair, felt computer stores were an "interesting experiment," but he was uncertain about their future. Some people thought it was sacrilegious to sell technology as sophisticated as computers in a storefront environment. Heiser's initial order was for $5,000 worth of Altair equipment. Everyone at MITS was astounded when, a few days later, a second order appeared from Arrowhead. Paul Terrel soon started a second store in Northern California, which beecame the first Byte Shop.

Bruce Seals arrived in New Mexico to sign up as an Altair dealer in Knoxville, Tennessee. Later he started Seals Electronics, which provided reliable memory for the early Altair systems.

Richard Stafford and Jim Dunion appeared at the MITS-Mobile seminar in Atlanta. Their arrival was to cause the local MITS representative anxiety. He quickly pointed out that trouble would undoubtedly ensue at the seminar since Stafford and Dunion had purchased two 4K dynamic memory boards; although they were assembled by different technicians, either could be made to work. During intermission they were invited to make their case. Curiously enough, this initial encounter ended on a friendly but firm note that either they receive satisfaction or they would make trouble.

Shortly thereafter, Stafford, Dunion, and others formed The Computer Systems Center, an Altair store in Atlanta, Georgia. They were joined by Ben Dyer, who was to become the store manager. This eventually led to the formation of Peachtree Software and Retail Sciences. Today The Computer Systems Center has been shorted to TCS and is a software company arriving in Houston, Texas.

In the midst of this flurry, Motorola announced the 6800 microprocessor, its entry the microcomputer race. This chip was believed by many to be a substantial threat the Intel 8080. As a hedge against this theat MITS engaged in a crash program produce an Altair with a 6800 chip, calied the Altair 680. BASIC was soon under development for this machine by Ric Weiland of Microsoft. It was sold to MITS for $32,000, in contrast to arrangements MITS had made with Microsoft for 8080 BASIC under an exclusive license agreement. The subtle distinctions in an exclusive license can prove crucial; BASIC is woven into many aspects of our story.

The 680 was to prove an inappropriate use of MITS' resources, and although perhaps 1,000 machines were shipped to enthusiastic hobbyists, today they are virtually nowhere to be found.

We're Number One

An early discussion at MITS evidenced concern that the world be told MITS was number one in the microcomputer field. One faction held that the general public needn't be told what they already knew, while the opposing view contended that an open statement to the market would have a number of beneficial effects. The advertising department soon provided what was to become known at MITS as the "number-one ad."

Every periodical on microcomputers would invariably make references to MITS/ Altair. The number-one ad soon appeared in many publications. Phone calls, letters, and visitors flooded into an otherwise dry Albuquerque.

Opportunists Hang On

Most entrepreneurs have certain common characteristics: They are extremely interested in money, have short attention spans, are sometimes paranoid, are poor at details, are unable to carry projects through to logical conclusions, change their minds frequently, bore easily, and will seldom talk of anything other than business. They are fundamentally opportunistic and will jump at any and all deals and roads to fame and financial success. Paradoxically, they are often unwilling or unable to turn over their business to outsiders, or anyone else for that matter.

The many opportunities that were brought to Albuquerque and to MITS' front door were viewed with a jaundiced, though not totally indifferent, eye. The number-one ad and the vast exposure of the MITS/ Altair name in the trade press stimulated many offers of acquisition. One such offer was presented by representatives of Pertec Computer Corporation. It appeared at the outset to be the most serious and substantial offer to date. This occurred against an increasing proliferation of competitive machines and a nagging fear that Texas Instruments (TI) would soon enter and immediately dominate the microcomputer market.

TI had approached MITS to determine whether an Altair-like product was of interest to MITS and its marketplace. The technology of the 9900 plus a lack of software was considered too severe to warrant such an effort. Nonetheless. when MITS had 6 million in sales and TI dropped 12 million into the calculator market in an apparent effort to dominate the market, it was very intimidating.

market in an apparent effort to dominate the market.It was very intimidating.

The Pertec overture was viewed with cautious optimism. The first, somewhat mysterious visit was fallowed by additional visits and a formal off er. Apparently the president of Pertec, Ryal Poppa, had become intrigued with the microcomputer market and realized the fact that Pertec produced the floppy and hard disks used in the MITS systems would provide a captive customer for Pertec products and afford entry into the microcomputer market for small-business systems.

In an enthusiastic determination to enter this new market, Poppa made a recommendation to the board that Pertec acquire MITS. The board responded with a number of pointed questions, which in turn resulted in a number of staff members being sent to Albuquerque to verify that the president had used sound business judgment The staff stayed long enough to gather the information needed to support Poppa's position and, without further investigation, departed.

Pertec was then negotiating the purchase of ICOM, a California-based company that was also a substantial customer for Pertec floppy disk drives. ICOM and Shugart were negotiating to meet future drive requirements with Shugart products. The ICOM acquisition by Pertec would provide a second captive customer for Pertec floppy drives.

Although unwittingly, ICOM was also to play a role in the eventual demise of MITS.

Clarence James Peters, Jr [...] is a physician, field virologist and former U.S. Army colonel. He is noted for his efforts in trying to stem epidemics of exotic infectious diseases such as the Ebola virus, Hanta virus and Rift Valley fever (RVF). He is an eminent authority on the virology, pathogenesis and epidemiology of hemorrhagic fever viruses.

Biography

Peters grew up in Odessa, Texas. At Rice University, he initially majored in chemical engineering, but switched to chemistry his junior year after taking courses with Thomas Brackett. He obtained his medical degree at Johns Hopkins School of Medicine and served his residency in internal medicine at the University of Texas Southwestern Medical School. He developed an interest in tropical medicine and virology while serving five years as a research associate at the National Institute of Allergy and Infectious Disease intramural laboratory in Panama. Upon returning Stateside, he completed his fellowship in immunology at the Scripps Clinic and Research Foundation.

He entered active duty in the U.S. Army and from 1977 through 1992 held several positions at the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID), Fort Detrick, Maryland, where he worked on biodefense and hazardous virus research. His positions there ranged from research scientist and Medical Division chief to Disease Assessment Division chief. **He led the team that controlled a 1989 Ebola introduction into a monkey facility in Reston, Virginia** (a story recounted in [**Richard McCann Preston (born 1954)**]'s best-selling book [**"The Hot Zone" (book, 1994)**]).

From 1992 to 2000 Peters was head of the Special Pathogens Branch at the Centers for Disease Control where he investigated hazardous emerging viruses. These included the agent causing the new disease hantavirus pulmonary syndrome in the southwestern US, which he discovered and named. He also led efforts in Africa (Ebola, Marburg, Lassa, Rift Valley fever), Asia (Nipah virus in Malaysia), and South America (Bolivian hemorrhagic fever, hantavirus pulmonary syndrome, Venezuelan equine encephalitis) to control outbreaks. [Note: Also see **1967 Marburg virus outbreak in West Germany**, regarding the leak where the virus was first seen/identified.]

Since 2000, Peters has been the John Sealy Distinguished University Professor of Tropical and Emerging Virology at the University of Texas Medical Branch (UTMB) at Galveston, where he has an active research program in SARS, Rift Valley fever, and other human pathogens. He is a professor in the department of pathology and in the department of microbiology and immunology. He is a member of the World Health Organization Collaborating Center for Tropical Diseases. He is also director for biodefense at the UTMB Center for Biodefense and Emerging Infectious Diseases.

Peters has published more than 300 papers on research and control of viral diseases including more than 70 publications on Rift Valley fever virus and more than 60 publications on arenaviruses. He has served on numerous committees dealing with disease problems worldwide and has been called back as a consultant to CDC and USAMRIID on influenza, vaccines, and other issues after his departure. He consulted with Taiwan on SARS control.

Current work

Most of Peters' current work in the laboratory deals with Bunyaviridae (including the phylogeny of phleboviruses such as Rift Valley fever (RVF), Arenaviridae (Lassa fever, South American hemorrhagic fevers) and SARS CoV. He runs an active program of human and animal vaccine development for RVF using reverse genetics. He and his colleague Ilya Frolov are developing alphavirus replicon vectored RVF vaccines for use in livestock and ultimately in humans. His arenavirus research concentrates on the effects of infection on cellular function, particularly those molecular interactions related to vascular permeability. SARS-CoV work includes antiviral drug development, model characterization, and interferon interactions. The Galveston National Laboratory, a Biosafety Level 4 laboratory, opened in 2008 at the University of Texas Medical Branch to allow scientists there to work safely with any pathologic agent. Peters expects to transition some projects to higher hazard viral hemorrhagic fevers and to develop projects on other viruses such as tick-borne flaviviruses, highly virulent avian influenza strains, and Nipah virus, a new, highly virulent paramyxovirus.

Disease experts are stumped by killer virus from Malaysia

By Patricia J. Mays
ASSOCIATED PRESS

ATLANTA — In a quarantined laboratory, U.S. scientists outfitted in biohazard spacesuits are probing a killer that has struck on the other side of the world.

The mysterious microscopic enemy has killed more than 100 people in Malaysia in seven months, and scientists are baffled about its origin and mode of transmission.

"Every couple of years something like this comes along," says Dr. C.J. Peters, head of the special pathogens branch at the Centers for Disease Control and Prevention. "We don't know how this stuff spreads, how far it's going to go. We really don't know what's at the end of the tunnel."

The rare form of viral encephalitis, which spread from pigs to humans, first surfaced last year. It has since sickened more than 250 Malaysians, mostly pig farmers. Many of their herds fell ill, and some pigs died. A similar illness afflicted 11 slaughterhouse workers in Singapore, one fatally, who killed pigs imported from Malaysia.

Soldiers have killed almost 1 million pigs and some stray dogs to try to curb the virus. On Monday, pet owners in Malaysia's high-risk areas were told to get their animals checked immediately after new tests confirmed house pets could transmit the disease to humans.

Medical authorities named the new virus Nipah, for the village where it first was isolated.

As remote as the Nipah virus might seem, controlling and understanding it are a concern of epidemiologists around the globe because of fear it could spread quickly.

"In today's world, it's not unrealistic to think of the possibility that someone could get on a plane and land in San Francisco with it," says Dr. Duane Gubler, director of the CDC's Division of Vector-Borne Infectious Diseases at Fort Collins, Colo.

"In today's world, it's not unrealistic to think of the possibility that someone could get on a plane and land in San Francisco with it."

Dr. Duane Gubler
infectious disease specialist

For months, Malaysian health officials were certain the killer was Japanese encephalitis, a mosquito-borne virus common to the area. The two pathogens cause similar symptoms — high fever, aches, eventual coma and, often, death.

But most people in the region had been vaccinated for Japanese encephalitis as children. Also, it doesn't usually kill adult pigs.

The government declared a state of emergency in three Malaysian states and launched fogging and vaccination campaigns, to no avail. The Nipah virus raged on. And despite no proof that Nipah can infect people who eat or handle pork, the epidemic has wreaked havoc on Malaysia's nearly $400 million pork industry.

On March 7, baffled Malaysian researchers sought help from their counterparts at Gubler's CDC office in Fort Collins.

Six days later, a Malaysian researcher arrived in Fort Collins with slides of cells infected with the virus. The researchers worked through the weekend, screening the sample against dozens of known viruses. All were negative.

When they tried to isolate Nipah, it formed giant cells with multiple nuclei — epidemiological patterns not at all like Japanese encephalitis. By Sunday, a red flag had gone up: The Nipah virus fit in none of the three virus families studied at Fort Collins and was actually a previously unknown paramyxovirus. This family includes measles and mumps, but one of the last new paramyxoviruses discovered was the especially virulent Hendra virus.

"That was when we . . . sent it to Atlanta," Gubler said.

The samples were taken to a special CDC lab that houses deadly microbes that have no vaccine or cure, such as the Ebola virus that killed 245 Zaireans in 1995.

The CDC's medical detectives quickly identified the culprit as related to but far deadlier than the very rare Hendra virus. Hendra was first detected in 1994 in Australia, where it killed 15 racehorses and two trainers.

But they know little else.

- *2009* *Phibro is sold to Occidential Petroleum*
- *2016* *Phibro is purchased by Energy Arbitrage Partners, a firm founded and controlled by Simon Greenshields*

From its humble origins in Hamburg Germany through its first incorporation and opening of Philpp Brothers London in 1909, Phibro (as it became known) expanded rapidly. The business established itself as the prototypical London commodities trading house and developed a flexible and entrepreneurial business model that evolved to capitalize on the opportunities that existed at the time.

The firm was an early pioneer in the development of liquidity and price transparency of the global commodities markets. Recognized as such, in 1942, the US government retained Phibro to assist it in the acquisition and development of a strategic metals reserve. In the early years the majority of the Firm's activity involved the trading marketing and processing of metal ores and concentrates.

Phibro also expanded aggressively into other products including oil, refined products, chemicals and fertilizer. The Firm subsequently developed a related asset strategy designed to strengthen its increasingly important role as the world's largest Commodities trading company. In 1988 Phibro became the largest independent oil refiner in the US.

In 1981, Phibro aquired Salmon Brothers and in 1998 the Firm became a subsidiary of Citigroup.

In January 2016 Phibro was acquired by Energy Arbitrage Partners (EAP). Today, Phibro is an independent firm headed by Simon Greenshields (CEO).

MENLO PARK, N. J. (AP) — Stockholders of Minerals & Chemicals Corp. of America have ratified a merger with Philipps Bros. Inc. and Philipp Bros. Ore Corp. of New York City. Stockholders of the Philipp concerns approved the proposal previously.

The new concern will be called Minerals & Chemicals Philipp Corp. and Charles A. Specht will be president. Headquarters will remain in Menlo Park. Philipp Bros. will be a division of the new company. Financial details of the transaction were not disclosed.

NEW YORK (UPI) — Englehard Industries, Inc., and Minerals & Chemicals Philipp Corp. have agreed in principle to merge Philipp into Englehard. It is proposed to split Englehard stock two-for-one, then to exchange for each Philipp share 1.094 share of Englehard common plus 0.177 share of a New Englehard $4.25 annual dividend preferred convertible into New Englehard common at three for one.

Article : Rise and Fall of a Commodities Powerhouse

See https://www.ft.com/content/92f86602-a7f1-11e4-be63-00144feab7de

Rise and fall of a commodities powerhouse

Phibro, the former trading house that once owned a Wall Street bank, to close after 114 years

Phibro is to be dismantled, ending a 114-year-long run for a former giant of the commodities markets that started in a Hamburg living room and became rich enough to take over a Wall Street investment bank.

The trading house's business will be wound down in the first quarter, owner Occidental Petroleum said last week. Occidental had bought the former Philipp Brothers in 2009 from Citigroup.

The decision to close comes as crude and other commodities scrape multiyear lows. Andrew Hall, Phibro chief, is an inveterate oil bull, renowned for making huge gains on bold bets that prices will rise. "He never goes short," Stephen Chazen, Occidental chief executive, once said.

Under Citi, Phibro was a profit engine that never suffered a losing year. But under Occidental it became a victim of listless oil markets followed by what Chris Stavros, chief financial officer, called "sharp commodity price movements" as crude plummeted to below $50 per barrel.

At its pinnacle in 1980, Phibro had $23.7bn in revenue, which ranked it the 15th largest US company at the time and was more than Occidental's net sales last year. In 1981, it acquired Salomon Brothers, the bond trading powerhouse.

The Salomon deal generated unaccustomed headlines for the powerful company. Phibro used a combination of discretion and aggressiveness to move "beach sands from Australia to Rotterdam, copper concentrates from the Philippines to Japan, cocoa from Brazil to Germany" and some 150 other commodities from tungsten to wax on any given day, according to a company history by Helmut Waszkis.

Phibro was a template for companies such as Glencore and Vitol that today dominate the commodities trade. It was an early adopter of oil swap derivatives, said Paul Newman of the broker ICAP. It pioneered lending to producers in exchange for the right to market their output.

"They were an extremely well organised and powerful enterprise," said David Messer, chief executive of Freepoint Commodities, a US-based trading house.

Julius Philipp started as a metal merchant in 1901 from his family's Hamburg flat. In 1909, his brother Oscar moved to London where he founded the first company named "Philipp Brothers" at 118 Leadenhall Street. In 1914, one of Oscar's apprentices opened an office in New York. Julius Philipp remained in Hamburg until the rise of the Nazis forced his family to move to Amsterdam. He died in the Bergen-Belsen concentration camp in 1944, according to the Waszkis company history.

> *He never goes short*
>
> *Stephen Chazen, Occidental chief executive, said of oil bull Andrew Hall*

The New York office eventually became Philipp Brothers headquarters. For decades it was run by German-Jewish immigrants who cultivated talent by hiring lehrlings, or apprentices. "A trader lives by his wits," Ludwig Jesselson, Phibro's longtime chief, used to say.

The inflationary 1970s were go-go years for Phibro. With access to oil from places such as Iran and Nigeria and relationships with refiners, the company increased profits more than tenfold. It helped create the petroleum spot market, where tankers change hands at a moment's notice. "They knew twice as much as you did about anything. They knew about where any drop of oil was at any point in time," said Michael Cosgrove, who brokered oil deals for the company.

Marc Rich, former senior figure at Phibro, left the company in 1974 and set up the foundation of Glencore

In 1979-80, when crude prices doubled following the fall of the Shah of Iran, Phibro made $1bn trading oil, said Al Kaplan, former president of Phibro's energy unit.

"We basically controlled the oil world," said Mr Kaplan. "It was quite amazing. We had very good people. There was no price dissemination, so we used to tell people what the price was."

Phibro became a proving ground for senior figures in the commodities industry including the late Marc Rich, the trader and pardoned fugitive who made a stormy exit in 1974. The company Rich founded became Phibro's bitterest rival and the foundation of Glencore.

Mr Hall joined Phibro from BP in 1982. In his bullishness he clashed with Mr Kaplan. One afternoon in the 1980s, Phibro sold millions of barrels of Brent crude in a large flurry of transactions, recalled Mr Cosgrove, the former broker. In the same phone call in which Phibro had sold the barrels, its trader suddenly said he now wanted to buy multiple cargoes instead.

Andrew Hall, Phibro chief

"Al just sold six cargoes short and went home and Andy walked in and decided to flip the book long," the trader told a stunned Mr Cosgrove.

Commodities slumped in mid-1980s and so did Phibro's profits. Soon Salomon executives grabbed control of the combined company and stripped Phibro from the parent's name.

"The acquirer never knew what hit it. The acquiree dominated almost from day one. A total mismatch," Michael Bloomberg, the former Salomon partner who became a financial technology mogul and New York mayor, wrote in a memoir.

Andrew Hall bought Derneburg Schloss, near Astenbeck in Germany

After Mr Hall took charge of Phibro's energy unit in 1991, the company shifted away from moving physical cargoes and into trading paper derivatives. With his wealth he bought troves of contemporary art and a castle in Germany located near a settlement called Astenbeck, after which he named his $4bn hedge fund. Controversy over a potential $100m pay award to Mr Hall after Citi had been bailed out by taxpayers prompted Phibro's sale to Occidental.

Mr Hall carries on with the hedge fund and remains a stubborn bull. In a recent letter to investors he acknowledged oil's dive but predicted prices in the $70-$80 per barrel range over the longer term.

"There have been two constants of the oil market," he wrote. "The first is that demand always grows. The second is that supply from existing resources always falls because of depletion."

MyStories articles from JewishLinkNJ

30+ parts ... part 1 is here ... : https://www.jewishlinknj.com/features/21401-my-stories

part 1 is here ... : https://www.jewishlinknj.com/features/21401-my-stories

I had graduated from college in June 1949, and I started at Philipp Brothers on July 5.

My first "office" consisted of a semi-automatic calculator on a small two foot by one foot adding machine stand, located in the office of the traffic manager, Mr. Fischmann. Consequently, I was always under observation and Mr. Fischmann had a habit, once in a while, when he was passing me, of throwing a question at me about the particular transaction that I was working on. He wanted to find out whether I knew and understood what I was doing or whether I was just doing it mechanically. It was a good way of keeping me on my toes, but I was exhausted by the end of the day from the strain. This lasted for some months, until, I guess, he was convinced that I would make it. My work during these months consisted strictly of calculations (preparing invoices and accountings), adding, subtracting, multiplying, dividing, percentages, decimal places etc. No higher math, but pages and pages and hours of work, just to calculate the value of all the parts of just one shipment.

PB, in those early years, was primarily a merchant dealing mostly in ores and concentrates, as well as metals and scrap. The company had its origin in Europe, mostly Germany, and had been founded by several German Jews who had come to the US with experience in metals and ores.

Philipp Brothers would, in its prime, be the world's largest metal merchant dealing not only in metals but also many other raw materials such as sugar and oil. No, we never handled flour, otherwise we could have baked a cake.

[...]

***Originally PB also had a chemicals division. In July 1936 that original company split into two parts**. The chemicals division became **Philipp Brothers Chemicals**, headed by **Siegfried Bendheim**, and the metals division became **Philipp Brothers Inc.**, headed by **Siegfried Ullmann**. **PB Chemicals** continued to exist until very recently, with its last headquarters in Fort Lee, New Jersey.*

*PB had started out as a private company, owned by the four senior officers. The company then changed its structure and became **Philipp Brothers Ore Corporation**, with a modest number of shares being made available for purchase to some senior employees. Eventually PBO merged into **Minerals and Chemicals Corporation of America**, a New Jersey company listed on the NYSE. This, for the first time, enabled senior officers to cash out and solved the problem of settling with estates.*

*Later, that entity, then known as **Minerals and Chemicals Philipp Corporation**, merged with Engelhard Corporation, also a New Jersey corporation. That company, headed by Mr. Engelhard, dealt primarily in precious metals, and it is said that he personally was the model for the book and movie "Goldfinger."*

When the company grew in size by leaps and bounds, management appointed officers from among the employees. I was appointed at first assistant vice president, later vice president, and subsequently, group vice president, which was one level below senior vice president.

An interesting occurrence happened in the 1960s. It involved the US Customs assessing an import duty on a Norwegian artificial Columbite, claiming it was a chemical and not a mineral. Since PB was the agent for the manufacturer Norsk Bergverk, and since the assessment of the import duty would make the importation uneconomical, we felt it our obligation to object to this assessment. Since importation and import duty was part of traffic responsibility, I was requested by management to handle it. I did a lot of home reading and talking to attorneys and finally thought I was ready for the fight. A meeting was arranged in an office of the Department of Commerce in DC. When I got there, I got a sinking feeling in my stomach since I was facing a battery of lawyers both from the Department of Commerce and the Treasury Department. They all sat on one side of the table and I, together with me and myself, sat on the other side. I presented my case and fortunately, since it was an informal rather than a court hearing, there was no need for formalities. I argued that in 1933, when Congress passed the act establishing import duties, there existed no such thing as artificial Columbite. Consequently, Congress could not have had this material in mind when establishing that the mineral Columbite was duty free. Therefore, if it cannot be classified as a chemical, it must be a mineral and be duty exempt. Lawyers call that Congressional Intent. I won and the material was declared duty free.

[...]

The company had annual management retreats to which managers from all over the world came to give reports and to discuss policy. Frequently one of these meetings would be held in Holland due to its central location. The company leased a small hotel in Schreveningen, near Amsterdam, for a few days to put everyone up. All meals were kosher and catered from Amsterdam. I attended a few of these meetings.

***The company eventually split off the minerals and chemicals division**, and later also the Engelhard portions, and then purchased the famous Wall Street firm of **Salomon Brothers**. As the company continued to grow, the Salomon portion became dominant, until, in the 1980s, the breakup of what once was the world's largest metal trading firm began. There are many reasons and theories for this breakup, but that is the subject of a different story.*

In 1982, due to the changes taking place in the conduct of the business, management decided to decentralize traffic, and to have each trader handle traffic under his own jurisdiction. With no traffic department, there was no need for a department manager anymore. I transferred to the steel trading department, where I supervised the trading activities of a new commodity for PB, namely, Oil Well Steel Drilling Pipe. During those boom years for oil drilling in the early 1980s, it had become a new section in the steel department, at the time managed by my friend Menno Ratzker. It was eventually, like so many other new PB ventures, a disaster, and when the drilling boom died out, everybody was stuck with huge inventories. But while it lasted it gave me the opportunity to learn something new, to trade for the first time and to travel to Houston many times as well as to other places in the US and to Mexico, Venezuela, Spain, France, Italy, Greece, and Romania, among others.

- 1955 - Founded by Karl William Edmark
- 1980 - Acquired by Eli Lilly and Company[1]
- 1994 - Acquired by Bain Capital
- 1998 - Acquired by Medtronic for $538 million[2]
- 2006 - Medtronic announces Physio-Control's spin-off[3]
- 2011 - Company taken private in 2011 via a $487 million acquisition by Bain Capital[4]
- 2016 – Stryker Corporation announces agreement to acquire Physio-Control International, Inc. for $1.28 Billion[5][*self-published source?*]

Products

The company's products are primarily for the emergency treatment of Sudden Cardiac Arrest (SCA) Events. The LIFEPAK line of defibrillators includes both advanced units for ACLS trained personnel, as well as Automated External Defibrillators (AEDs) for use by First Responders and the general public. Additionally, the company produces an automated chest compression system called the LUCAS 2. While this system may be used in the field, it has also been used in the hospital setting to prolong human life while surgical or other procedures are accomplished.[6]

Company Perspectives:

We make lifesaving tools for lifesaving teams ... unique medical devices of the highest quality, which predict or urgently intervene in life-threatening, cardiorespiratory events.

Company History:

Physio-Control International Corp. is the world's leading manufacturer of external defibrillators, medical devices that apply an electrical shock to victims of sudden cardiac arrest or ventricular fibrillation, in which the heart begins to flutter or beat irregularly, to restore a normal heart rhythm.

Physio-Control defibrillators account for half of all those sold to hospitals in the United States. In addition, the company has a commanding 85 percent to 90 percent share of the advanced life support market in the United States, consisting primarily of paramedic and fire-rescue vehicles, and was an early leader in the developing "first-responder" market for automatic external defibrillators (AEDs). AEDs were designed to be used by police officers, firefighters, security guards, and others with limited medical training who often arrive first at the scene of an emergency.

Physio-Control, which went public in 1995 after being sold to an investment group by Eli Lily & Co. the year before, had sales of $173.16 million for fiscal 1996. The company, whose products are sold in 70 countries, was traded on the NASDAQ exchange under the symbol PHYS.

The 1950s-60s and Dr. Karl Edmark

Dr. Karl William Edmark (1924-94) was in his last year of residency at Lahey Clinic in Boston in 1954 when he built his first electronic monitor, a boxy-looking device with a light that flashed every time a patient's heart beat and set off an alarm if the beat faltered during surgery. He patented the device, which he called a Heartbeat Indicator, and in 1955, set up a corporation, the Physio-Control Co., to handle any income from his invention.

Later that year, Edmark moved to Seattle, where he became one of the city's leading cardiovascular surgeons, performing the first open-heart surgery at Swedish Hospital and, later, establishing the Cardiovascular Associates Laboratory at Providence Hospital. He also continued to experiment with electronics, developing the Pressure Pulsometer, which monitored a patient's blood pressure during surgery.

In 1961, Edmark unveiled a defibrillator that operated on direct current. When a heart goes into fibrillation, it begins to flutter and is unable to pump blood through the body. Defibrillators administer an electrical shock, which momentarily stuns the heart and allows it to return to a regular heartbeat. Until Edmark introduced his DC Pulse Defibrillator, medical defibrillators used AC, or alternating current, which caused patients to spasm violently because of the high voltage. The DC defibrillator allowed surgeons to administer a more-controlled, low-voltage shock that restored the heartbeat without causing additional trauma.

Edmark licensed manufacturing and distribution rights to the DC Pulse Defibrillator and the Pressure Pulsometer to American Optical, one of the first big companies to enter the electronic medical-instruments industry. Over the next few years, Physio-Control, which had been bankrolled by Edmark and a few personal friends, received about $10,000 annually in royalties, which was plowed back into research.

Then in 1965, American Optical announced that it had refined Edmark's inventions to the point where it no longer felt it needed a licensing agreement with Physio-Control to manufacture and sell the devices. Without a source of revenue, Edmark faced a decision: either he could shut down Physio-Control or begin running it as a business instead of a research laboratory. He chose the later. He also asked [William Hunter Simpson (born 1926)], then Northwest district manager for IBM Corp. in Seattle, if he was interested in becoming Physio-Control's first full-time president.

[William Hunter Simpson (born 1926)] had known Edmark since 1963, when he had hired the cardiologist as a consultant. At the time, IBM, which designed the first heart-lung machine for the Mayo Clinic, had been interested in further exploring the medical instruments industry. Although it meant giving up a secure position and taking a cut in pay, Simpson accepted Edmark's offer, starting his new job in January 1966.

A graduate of the School of Business at the University of Washington, who also had studied pre-med, [William Hunter Simpson (born 1926)] spent his first year at Physio-Control raising $300,000 in venture capital, attracting local investors such as Bagley Wright, whose company, Pentagram Corp., built the Space Needle for the Seattle World's Fair. He also changed the name of the company to Physio-Control Corporation, and more narrowly defined the company's market niche. According to Harriet and Terry King in *The Team*, a book published by Physio-Control detailing its first 25 years, Simpson told the company's five employees, "Our immediate goal is to install coronary care systems in Puget Sound hospitals and smother them with love, attention and service. After that, when the time is right, we can think about marketing nationally."

Lifepak/33, 1968

It did not take long. Physio-Control manufactured its 100th patient monitor and defibrillator in the fall of 1967, and reported revenues that year of more than $500,000. Financially, Physio-Control was near the break-even point, and **[William Hunter Simpson (born 1926)]** told stockholders at the annual meeting in the spring of 1968, "The name of the game is now marketing." About the same time, Physio-Control learned that Zenith Corp. was developing a bulky--but portable--56-pound monitor/defibrillator. Simpson faced the challenge head-on, assigning Stanley Seiffert, Physio-Control's manager of technical

operations, the task of designing a portable monitor-defibrillator that would be more than 20 pounds lighter. Physio-Control named the yet-to-be-built device the Lifepak/33.

Physio-Control introduced the Lifepak/33--which ended up weighing 34 pounds--at the annual American Heart Association meeting in November 1968, but not without some last-minute difficulty. The night before the show opened, someone tried to smash two of the units. The devices were also left on, draining the batteries. But if a competitor was behind the vandalism, as many believed at the time, the publicity surrounding the "sabotage" made the Lifepak/33 the star of the show.

Soon afterwards, Physio-Control was able to raise another $600,000 in venture capital, and commercial production of the Lifepak/33 began in February 1969. The 15th and 45th units were sold to the U.S. Navy, which installed them aboard Air Force One and Air Force Two, the aircraft assigned to carry the president and vice president of the United States. That same year, Jacksonville, Florida, became the first city to install portable defibrillators in all 10 of its fire department emergency vehicles. Physio-Control closed out its fiscal year, at the end of September 1969, with more than $1 million in sales for the first time, although still posting a loss for the year of $35,000 because of production start-up costs.

Physio-Control went public in 1971, selling 20,000 shares of stock at $25 each. All but 7,000 shares were purchased by original investors in the company. Physio-Control also launched a national advertising program built around the success of innovative Seattle's Medic 1 program, which equipped emergency vehicles with sophisticated medical equipment, including a Lifepak/33. Sales increased that year to $2.4 million, with net earnings of $266,000.

Two years later, in 1973, Physio-Control introduced the Lifepak 3, a third generation of its portable external defibrillator. The company also began construction of a $2 million headquarters and research center on 11 acres overlooking the Sammamish River in rural Redmond, Washington, later to become the home of Microsoft Corp. In 1974, Physio-Control added the Lifepak 4, which featured an electrocardiogram strip-chart recorder to provide a permanent record of a patient's heartbeat, to its growing family of portable Lifepak defibrillators. Revenues that year topped $10 million, and Physio-Control posted earnings of $1.05 million.

For several years, Physio-Control products had been distributed primarily by Minneapolis-based Medtronic, Inc. But in 1975, inventory began to accumulate in Medtronic's warehouses. Physio-Control was worried that Medtronic eventually would be forced to slash prices on more than $5 million worth of defibrillators and dialysis machines, seriously upsetting the company's long-term marketing plans, When Medtronic suggested that it might be interested in acquiring the much smaller Physio-Control, [**William Hunter Simpson (born 1926)**] turned the offer around. Betting that he would be able to sell the stockpiled inventory in an orderly manner--and finance the acquisition with the proceeds--Simpson offered instead to purchase Medtronic's instrument-sales division. The gamble paid off with Physio-Control posting records sales that year of $12.9 million, although earnings were down.

Meanwhile, the company was also facing another challenge. Physio-Control learned that a United Kingdom company was developing a defibrillator designed specifically to be used by paramedics in the fast-growing emergency medical market. The small, portable units were expected to weigh half as much as Physio-Control's newest model, the Lifepak 4. John Gallagher, then vice president of engineering at Physio-Control, was assigned the task of pulling together a design team to rebuff the challenge with a radically different Lifepak 5.

Initially, the design team considered packing the components of the defibrillator into a bright orange belt that could be worn by the paramedics. But feedback from Seattle's Medic 1 staff indicated that was unworkable because the bulky belt design would interfere with wearing seat belts in the emergency-response van. Physio-Control eventually settled on a more conventional design, and the Lifepak 5--weighing just 18 pounds--was introduced at the annual meeting of the American College of Cardiology in February 1976.

Physio-Control's sales that year rose by more than 20 percent, to $15.7 million, although net income, still affected by the Medtronic acquisition and inventory glut, remained below $1 million. The following year, 1977, sales topped $21 million and net income almost doubled to $1.7 million. Physio-Control, which received a Presidential "E" Award from the U.S. Department of Commerce, had become the largest manufacturer of defibrillator/monitors in the world, exporting medical devices to 33 countries.

Acquisition by Eli Lilly, 1980

In 1979, Physio-Control acquired Biomega Corp., in Gainesville, Florida, which made semi-automatic blood-pressure monitors for use in emergency vehicles. The company also formed a joint venture with Valleylab Inc. in Boulder, Colorado, to develop and market pacemakers and other implantable medical devices. Revenues continued to grow, surpassing $41 million, while net income that year was more than $3.9 million. Physio-Control had also grown to more than 700 employees.

In addition, the company had begun attracting considerable interest from much larger corporations looking to expand their medical-device divisions. In early 1980, Physio-Control announced that it was being acquired by pharmaceutical giant Eli Lilly & Co. in a stock deal worth about $145 million, returning $170,000 for every $1,000 the original investors had put into the company in 1966. At Physio-Control's annual meeting, Hunter told shareholders, "The fit is quite magnificent, almost designed, because of the attitudes and philosophies of the two companies." In prescient fashion, [**William Hunter Simpson (born 1926)**] also noted, "The stability of size (offered by Eli Lilly) is also important. I don't care how good a company is in this day and age, there is always the possibility of recall (of a product). It could be disastrous for a small company."

In 1985, Physio-Control introduced the world's first automatic external defibrillator. The Lifepak 300, designed for use by police, firefighters, security guards, and other "first responders," was a battery-powered defibrillator about the size of a shoe box and weighing just six pounds. The computer-controlled defibrillator automatically interpreted a victim's heartbeat and determined if a defibrillating shock was indicated. The device also was designed not to allow a shock to be administered if it was not indicated.

The same year, Physio-Control, which had pioneered profit-sharing and the 10-hour, four-day work week for its employees, was included in an annual listing of "The 100 best companies to work for in America." Simpson also retired at the end of 1985, ending 20 years at the helm of Physio-Control. He was succeeded as president and chief executive by Gilbert W. Anderson, then 57, Physio-Control's executive vice president. A graduate of the University of Washington, Anderson previously had been chief executive at Stetson-Ross, a manufacturer of heavy equipment and electronics products.

Sales of the Lifepak 300--despite its innovative design--were sluggish until 1988, when researchers from the University of Washington published a report in the *Journal of the American Medical Association* that documented in-flight deaths of airline passengers and called for airlines to carry automatic defibrillators on board. The university study--funded by Physio-Control, the Laerdal Medical Group, a Swedish competitor, and the National Center for Health Services Research, a federal agency--found that 60 percent of nearly 600 in-flight deaths reported during the period, were related to heart attacks. The American Heart Association later endorsed the study in calling for automatic defibrillators to be carried aboard commercial passenger flights. In 1990, Virgin Atlantic Airways became the first airline to carry automatic defibrillators aboard its overseas flights, purchasing them from Physio-Control.

FDA Shutdown in 1992

In 1992, Physio-Control voluntarily shut down production of its defibrillators and patient monitors after a review by the U.S. Food and Drug Administration found the company had failed to follow "good manufacturing practices," including inadequate failure investigations, not properly inspecting critical components of its products, and failing to adequately document manufacturing and testing procedures in writing.

Although the FDA never claimed that patients had been harmed by malfunctions of the medical equipment, and no recalls were ordered, Physio-Control signed a consent decree outlining steps it would take before resuming production. Richard O. Martin, former vice president of business development who had succeeded Anderson as president and chief executive in 1991, later told the *Puget Sound Business Journal* that Physio-Control "truly, fundamentally believed" that it was in compliance with all FDA requirements. He blamed the sanctions on political pressure then being brought to bear on the FDA to become more forceful in its interpretation of the rules.

In a newspaper column, Martin would later write, "Perhaps the FDA needed to flex some muscle; the agency's reputation was besmirched due to the controversy over its generic drug scandal, the recall of the Dalkon shield IUD, and silicone gel breast implants. If that is the case, then it seems to me the FDA is guilty of shooting itself in the foot. Our government is not only crippling the medical community but maiming the entrepreneurial companies that are the backbone of American business."

Whatever the reason for the FDA's action, the shutdown contributed to the first-ever loss reported by Eli Lilly, for the third quarter of 1992. Eli Lilly did not disclose how much of its $268 million loss stemmed from the problems at Physio-Control, which kept all 1,000 employees on the payroll. But the company's Medical Devices and Diagnostics Division, which included Physio-Control, took a pretax charge of $180 million "responding to regulatory initiatives, including actions to strengthen ... good manufacturing practices and procedures." Sales at Physio-Control fell from a high of $158 million in 1991 to less than $80 million in 1992.

The shutdown, which only affected production for domestic sales, also lasted much longer than anyone expected. Physio-Control, which predicted it would resume full production within six months, finally was allowed to resume production of the Lifepak 10, an in-field model representing about 40 percent of the company's pre-shutdown revenues, 12 months later. The company was not allowed to resume full production of all lines until June 1994, 753 days after the shutdown began.

By then, Eli Lilly & Co. had pumped an estimated $140 million into Physio-Control to keep it going. Simpson, then retired, told the *Journal American*, "Physio is a precious thing, and if it hadn't been for Lilly, it would have disappeared a year ago." Although Eli Lilly said it was unrelated to the difficulties at Physio-Control, the pharmaceutical company also announced at the start of the year that it would sell three of the companies in its medical devices division, including Physio-Control, and spin off the others in a public offering. In July, Physio-Control was sold to Bain Capital Corp., a Boston investment group, for $23.3 million. Steve Pagliuca, managing director at Bain Capital, was named chairman of Physio-Control.

Recovery and Outlook

Despite the long shutdown, Physio-Control recovered quickly because of its strong market presence. During the shutdown, the company had developed a backlog of more than $70 million in orders from hospitals and emergency medical services. Incredibly, the company eventually filled more than 80 percent of those orders. Martin told the *Puget Sound Business Journal*, "That, more than anything else, speaks to what the customer thought of Physio-Control. People actually waited until they could get the Physio product."

In December 1995, less than 18 months after buying Physio-Control, Bain Capital sold 90 percent of the company in an initial public offering for $172 million. That year, the company reported sales of $148.7 million, nearly 95 percent of its pre-shutdown sales. In 1996, sales reached a record high $173.16 million.

Capping its comeback, in 1996 Physio-Control was named one of the best manufacturing facilities in the United States by *Industry Week*, which noted that the company's portable defibrillators "have to be particularly rugged to withstand the harsh treatment they are often subjected to in the field. In product demonstrations (sales representatives) have been known to pick up the instruments and heave them onto the floor as if they were bowling balls--a maneuver known as 'the salesmen's toss.' As in the old Timex watch commercials, they then proceed to show that the products still work."

In 1996, Physio-Control also received FDA approval to market the Lifepak 500, a lightweight, automatic external defibrillator (AED) designed for use by "first responders," who often arrive first at the scene of an accident or medical emergency. The battery-operated, computer-controlled Lifepak 500, which sold for less than $4,000, automatically analyzed a victim's heartbeat and indicated, through voice prompts and visual readouts, whether a defibrillating shock was necessary. The shock was applied by pushing a button.

One of Physio-Control's competitors in the first-responder market was Heartstream Inc., a company formed in 1992 by five former Physio-Control employees, which also introduced a lightweight AED in 1996. Physio-Control sued Heartstream in 1995, alleging the theft of trade secrets, and Heartstream countersued, alleging unfair business practices. The lawsuits were still pending in early 1997. Other competitors in the emerging market included Zoll Medical, SurVivaLink, and Laerdal Medical.

Analysts indicated there was an enormous, potential market for AEDs, including sports stadia, high-rise office buildings, doctors' offices, public swimming pools and beaches, health clubs, retirement homes, and community centers. An estimated half million Americans suffer sudden cardiac arrest every year and only about 5 percent survive, in part because defibrillation needs to be administered within the first 10 minutes to be most effective. In the mid-1990s, the American Heart Association, the American College of Cardiology, and the International Association of Fire Chiefs were among the organizations calling for widespread access to early defibrillation. At Physio-Control, Martin, who was elected chairman in 1997, liked to say that one day AEDs would be as common as fire extinguishers.

Helicopter taking President Ford on first leg of a speaking tour also carries a portable machine that could save his life in case of a heart attack.

One of the President's Traveling Companions

by Doug Spangler

One of President Gerald Ford's constant traveling companions is Lifepak 4. This isn't another secret service unit, or a new bulletproof vest. But it's one of the most important precautionary measures the President has at his disposal. It may one day save his life.

Lifepak 4 is a portable, battery-powered cardiac defibrillator. This amazing piece of equipment stands ready to help the President in case of a heart attack or any other heart problem.

Should an attack occur, medical personnel would quickly take out two round, hand-sized paddles attached to the machine. These serve both as monitoring and defibrillation electrodes. Holding one paddle on the left side of the President's bare chest and the other paddle on his right front side, aides could immediately get a reading of his heartbeat on the Lifepak 4's cardioscope—a small, TV-type screen which emits a "beep-beep" sound. At the same time, the machine produces a permanent electrocardiograph on tape as a record of the episode.

These monitors would show at once what the President's heart is doing. If they indicate a cardiac arrest (when the heart completely stops or has ventricular fibrillation—a weak, rapid, and ineffective twitching of the heart muscle), the same paddles could then administer a brief, electric shock to restart his heart into regular beats. Special pushbuttons on the paddles release a 320-joules (watt-second) jolt—equivalent to 53,000 watts in 6/1000ths of a second. Another shock could be administered in less than 10 seconds.

When the monitors indicate a normal heartbeat, the President would be rushed to a hospital, with other cables fastened to his chest to provide continuous readings.

President Ford isn't the only individual currently being protected by the 36-pound, 8 by 14 by 19-inch portable device. A Lifepak travels with Secretary Kissinger on his shuttles. Another of the rechargeable nickel-cadmium battery devices is kept in the Capitol for use in a Congressional emergency. The U.S. military made good use of the machines during the Vietnam War. The Shah of Iran and the royal family of Saudi Arabia have models on hand.

For workers and players

More than 20 defibrillators have been placed along the Alaska pipeline construction route in case a worker has a heart seizure, and professional football teams, including the St. Louis Cardinals, Buffalo Bills and Cleveland Browns, have them in the clubhouse. Major airports keep them handy, as do a number of banks, industrial corporations and ski and tennis resorts. Some private individuals have shelled out the $4500 that a Lifepak 4 costs. There also is a lightweight defibrillator, powered by flashlight batteries, called Physio 260, that sells for under $1000.

The U.S. Government purchased its first two Lifepaks in 1969 for possible use by President Nixon. Rear Admiral William M. Lukash, President Ford's personal physician, told PARADE we have the "cardiac defibrillator in the event of an acute cardiac emergency associated with ventricular fibrillation or cardiac arrest. The initial consideration for having a defibrillator readily accessible developed because of former President Johnson's history of having had a previous coronary."

Lifepak 4 measures only 8 by 14 by 19 inches, but it has the power to overcome heart emergencies. Cost: $4500.

Speed is the key

In case of emergency, speed is essential. If a cardiac arrest remains untreated for as little as four to six minutes, the brain is damaged. If it continues beyond that, death is imminent.

Lifepak 4 is the top of a line of portable, battery-powered defibrillators produced by Physio-Control Corp. of Redmond, Wash. It was developed by Dr. William Edmark, a Seattle cardiovascular surgeon and director of research for Physio-Control.

"As a surgeon, I had expected it to be used mainly during operations," Dr. Edmark says. "But its real value proved to be for hospital intensive care units, which are administered by cardiologists. Today, however, resuscitation has basically moved out of the coronary care units. Lives are saved more now by the portable defibrillators out in the streets and homes."

Additional usefulness can come from an optional modulator, which, attached to the Lifepak, provides an FM signal for either a telephone or radio transmission of a patient's electrocardiogram. Medical aides using the modulator can relay heart data immediately to a hospital emergency room. A doctor can then instruct them on the proper course of action.

Doctors have them

Some 10,000 Lifepaks are now in use throughout the world, most of them in doctors' offices, hospital coronary care units, emergency rooms, operating rooms and recovery rooms. Many hospitals have cardiac defibrillators carried on carts, ready to be rushed to a patient's room in emergencies.

Yet the usefulness of the defibrillator doesn't end there. The American Heart Association reports that nearly 700,000 deaths result each year from heart attacks, with half the victims dying before they reach the hospital. This is why an increasing number of emergency care units are equipping themselves with Lifepaks or equivalent machines, ready to speed life-giving aid not only to the President but to the man in the street.

Peter Karel Piot, Baron Piot, KCMG, FRCP, FMedSci (born 17 February 1949)[1] is a Belgian microbiologist known for his research into Ebola and AIDS. Piot is the director of the London School of Hygiene and Tropical Medicine.[2]

After helping discover the Ebola virus in 1976 and leading efforts to contain the first-ever recorded Ebola epidemic that same year, Piot became a pioneering researcher into AIDS. He has held key positions in the United Nations and World Health Organization involving AIDS research and management. He has also served as a professor at several universities worldwide. He is the author of 16 books and over 600 scientific articles.

Early life and education[edit]

Piot was born in Leuven, Belgium.[1] His father was a civil servant who worked with agricultural exports and his mother ran a construction company. Piot is the oldest of two brothers and a sister.[1]

After beginning in the school of engineering and physics at Ghent University studying physics, Piot changed to medicine. During medical school, Piot received a Diploma in Tropical Medicine from the Institute of Tropical Medicine Antwerp in Antwerp. In 1974, he received a M.D. from Ghent University.[1]

In 1980, Piot received a PhD in clinical microbiology from the University of Antwerp.[1][3]

Career[edit]

In 1976, while working at the Institute of Tropical Medicine, Piot was part of a team that observed a Marburg-like virus in a sample of blood taken from a sick nun working in Zaire.[4][5] Piot and his colleagues subsequently traveled to Zaire as part of an International Commission set up by the Government of Zaire to help quell the outbreak.[1] The International Commission made key discoveries into how the virus spread, and traveled from village to village, spreading information and putting the ill and those who had come into contact with them into quarantine. The epidemic was already waning when the International Commission arrived, thanks to measures taken by local and national authorities, and it finally stopped in three months, after it had killed almost 300 people.[6] The events were dramatised by Mike Walker on BBC Radio 4 in December 2014 in a production by David Morley. Piot narrated the programme.[7]

Piot has received the majority of the credit for discovering Ebola, since in 1976, it was claimed he was the one to receive blood samples while working in a lab at the Institute for Tropical Medicine in Antwerp, Belgium.[3] The samples were once claimed to be originally sent by Dr. Jean-Jacques Muyembe-Tamfum, a Congolese doctor who obtained the blood samples from those sickened with a mysterious disease in then-Zaire, later discovered to be Ebola. In 2012, Piot published a memoir entitled No Time to Lose which chronicles his professional work, including the discovery of the Ebolavirus; he mentions Muyembe in passing rather than as a co-discoverer.[8] In a 2016 Journal of Infectious Disease article, co-signed by most of the actors from that first outbreak, including Peter Piot and Jean-Jacques Muyembe, the claims by both Piot and Muyembe to have played a significant role in the early discovery of Ebola have been refuted.[9] Piot stated in 2019 that "my book was not an attempt to write the history of Ebola, but more my personal experience".[10]

In the 1980s, Piot participated in a series of collaborative projects in Burundi, Côte d'Ivoire, Kenya, Tanzania, and Zaire. Project SIDA in Kinshasa, Zaire was the first international project on AIDS in Africa and is widely acknowledged as having provided the foundations of science's understanding of HIV infection in Africa. He was a professor of microbiology, and of public health at the Prince Leopold Institute of Tropical Medicine, in Antwerp, and at the University of Nairobi, Vrije Universiteit Brussel, the Lausanne, and a visiting professor at the London School of Economics. He was also a Senior Fellow at the University of Washington in Seattle, a Scholar in Residence at the Ford Foundation, and a Senior Fellow at the Bill & Melinda Gates Foundation.[3]

From 1991 to 1994, Piot was president of the International AIDS Society. In 1992, he became Assistant Director of the World Health Organization's Global Programme on HIV/AIDS. On 12 December 1994, he was appointed Executive Director of the Joint United Nations Programme on HIV/AIDS (UNAIDS) and Assistant-Secretary-General of the United Nations.[11]

From 2009 to 2010, Piot served as director of the Institute for Global Health at Imperial College London.[3]

London School of Hygiene & Tropical Medicine[edit]

In October 2010, Piot became the director of the London School of Hygiene & Tropical Medicine.[12]

In addition to his work at LSHTM, Piot is a member of the Institute of Medicine of the National Academy of Sciences of the United States and the Royal Academy of Medicine of Belgium, a Fellow of the Royal College of Physicians of London, UK and a Fellow of the Academy of Medical Sciences. In 2011, Amy Gutmann appointed him to serve on the International Research Panel at the Presidential Commission for the Study of Bioethical Issues.

In 2014, in the face of an unprecedented Ebola epidemic in western Africa, Piot and other scientists called for the emergency release of the experimental ZMapp vaccine for use on humans before it had undergone clinical testing on humans.[13] That year, he was appointed by Director General Margaret Chan to the World Health Organization's Advisory Group on the Ebola Virus Disease Response, co-chaired by Sam Zaramba and David L. Heymann.[14] He also chaired an independent panel convened by Harvard Global Health Institute and the London School of Hygiene & Tropical Medicine into the national and

chaired an independent panel convened by Harvard Global Health Institute and the London School of Hygiene & Tropical Medicine into the national and international response to the epidemic, which sharply criticised the response of the WHO and put forward ten recommendations for the body's reorganisation.[15] In February 2020, he criticised the delay in declaring the 2019–20 novel coronavirus outbreak focused on Hubei, China, a Public Health Emergency of International Concern, and advocated a five-point scale for outbreaks, rather the current binary (emergency/no emergency) system.[16]

In 2020, Piot was appointed to the European Commission's advisory panel on COVID-19, co-chaired by Ursula von der Leyen and Stella Kyriakides.[17]

Personal life[edit]

In May 2020, Piot disclosed that he had had COVID-19.[18]

Piot is fluent in English, French, and Dutch.[3]

Other activities[edit]

- Centre for International Health Protection (ZIG), Robert Koch Institute (RKI), Member of the Scientific Advisory Board (since 2020)[19]
- Exemplars in Global Health, Member of the Senior Advisory Board (since 2020)[20]
- Coalition for Epidemic Preparedness Innovations (CEPI), Member of the Board (since 2018)[21][22]
- The Lancet Public Health, Member of the Editorial Advisory Board (since 2016)[23]
- Africa Health Research Institute (AHRI), Chair of the Board of Directors (since 2017)[24][25]
- UK Collaborative on Development Research (UKCDR), Chair of the Strategic Coherence of ODA-funded Research (since 2017)[26][27]
- Africa Research Excellence Fund (AREF), Member of the Advisory Panel (since 2015)[28]
- Novartis Foundation, Member of the Board of Trustees (since 2015)[29][30]
- Antwerp Management School, Member of the International Advisory Board[31]
- Centre Virchow-Villermé, Member of the International Advisory Board[32]
- Global Health Corps, Member of the Board of Advisors[33]
- Global Health Innovative Technology Fund (GHIT), Member of the Board of Directors[34]
- The Lancet, Member of the International Advisory Board[35]
- University of Washington, External Member of the Advisory Board at the Department of Global Health[36]
- World Health Summit, Member of the Council[37]

Awards[edit]

- 2003: Calderone Prize[38]
- 2004: Vlerick Award
- 2008: America-Flanders Award[39]
- 2013: Hideyo Noguchi Africa Prize[40]
- 2013: Prince Mahidol Award[41]
- 2015: Prix International de l'INSERM[42]
- 2015: Canada Gairdner Global Health Award[43]
- 2016: Manson Medal[44]

Honours[edit]

National honours[edit]

- Belgium:
  - Appointed as Baron by King Albert II of Belgium (1995)

Foreign honours[edit]

- Zaire:
  - Officer of the National Order of the Leopard (1976)
- Senegal:
  - Officer of the National Order of the Lion
- United Kingdom:
  - Honorary Knight Commander of the Order of St Michael and St George (2016)[45]
- Japan:

(2014, Dec) - Time Magazine - Person(s) of the Year ... The Ebola Scientists

Dr. Peter Piot, 65 : Co-discoverer of Ebola

Source - [HP0055][GDrive]

In our lab at the Institute of Tropical Medicine in Antwerp we saw the Ebola virus for the first time on the 10th of October in 1976. We received one of those shiny blue thermoses that you use to keep coffee or whatever. This [contained] blood from a Catholic nun who had died of hemorrhagic symptoms, which, retrospectively, should have triggered alarm bells.

It was my colleague Guido Van Der Groen who opened it. We just wore latex gloves, opened it under laminar flow, which is negative pressure so the air is sucked up and doesn't blow into your face. What we saw was one intact vial swimming in half water, half ice. Another vial had broken. There was some blood, and therefore virus swimming in that thermos, but we didn't know then.

We had no clue this was so dangerous. What we did was good lab practice in terms of how to manipulate the samples. In theory that was enough for Ebola, but the problem is you don't want to use this regular infection control for Ebola because the slightest mistake can be fatal. That we didn't know.

Those days, isolating a virus was very artisanal, more like cooking than anything else. You bring the blood, which we diluted, in tubes and flasks with VERO cell lines, and you inoculate it into baby mice and a guinea pig. It took a few days before we saw the effect on the cells. Basically the virus kills cells—instead of a nice carpet of intact cells you see holes appearing because the cells with infected virus are dying off. Then some mice started dying.

That's when we got really excited. My colleague had prepared the fluid from the VERO cells for taking pictures on the electron microscope. We saw these pictures of a wormlike structure, which we really had never seen. This was pre-Google, so we had to go to the library to look at an atlas of viruses and confirm that there was only one known virus that had that kind of structure. Most viruses are kind of spheres or squares. This was like a worm type. The only one that it looked like was Marburg. That had been discovered a few years before.

That was the aha moment. We said "Wow, is this new, or this is Marburg"—which had never been shown to cause an epidemic before. In the meantime there was news of a very bad epidemic going on with lots of people dying in what was then Zaire. We got news to stop working on the virus from the WHO. It was too dangerous, a hemorrhagic fever.

To be honest, we continued for 24 hours to work with the virus. But we packed it all, sent it to Proton Down in the U.K., which is a military lab equipped for working with highly dangerous pathogens. I wanted to go to Africa to see what was going on there, how [the virus] was transmitted, how many people were dying. That was a very unique opportunity to figure out how the pathogen is spread in a community.

The rest is history. It changed my life. It was a kind of dream come true because I always wanted to work in Africa dealing with epidemics. Our protective gear was a surgical mask, motorbike goggles, gloves and a paper surgical gown—that's all. We didn't have more than that.

Before leaving for the epidemic zone in Yambuku, I met a woman in a hospital in Kinshasa who was not yet terminal but was in a very poor state. I felt a mixture of curiosity and then sadness to see this was a young woman around my age. She was a nurse so she was also getting ready to go to the U.S. She had gotten a fellowship to further train in the U.S. She had this look in her eyes, which I later saw a lot when I went to the epidemic zone. These people know they are going to die. I also found this later in the Congo and Kinshasa, when I started working with AIDS—this empty look of starting into infinitum.

I drew her blood and I examined it under a microscope. What I remember was that this woman had basically no platelets. There was clearly a major problem with her blood coagulation. But it all came too late. We didn't know what to do.

I returned from our first visit to Yambuku while the epidemic was still going on. One night in Kinshasa we had a late-night meeting, and we said this virus needs a name. [CDC researcher and team leader] Karl Johnson said, 'If you name it after the place where the epidemic first occurred, you really stigmatize the place. Imagine you introduce yourself, say, "Hi, I'm from Lassa." That's not a safe introduction.'

So he said, "Let's take a river." We had a fairly small map of Zaire—Zaire is about the size of all of Europe. We were looking at rivers close to Yambuku, and that was Ebola. In the end it was not the nearest river, but still, it's a beautiful name. You remember it. —as told to Alice Park

Project Plowshare

From Wikipedia, the free encyclopedia

Jump to navigation Jump to search

This article is about proposed peaceful uses of nuclear weapons. For the serialized Philip K. Dick novel with the same name, see The Zap Gun. For the Christian anti-nuclear protest movement, see Plowshares Movement.

The 1962 "Sedan" plowshares shot displaced 12 million tons of earth and created a crater 320 feet (100 m) deep and 1,280 feet (390 m) wide

Project Plowshare was the overall United States program for the development of techniques to use nuclear explosives for peaceful construction purposes. As part of the program, 31 nuclear warheads were detonated in 27 separate tests. Plowshare was the US portion of what are called Peaceful Nuclear Explosions (PNE); a similar Soviet program was carried out under the name Nuclear Explosions for the National Economy.

Successful demonstrations of non-combat uses for nuclear explosives include rock blasting, stimulation of tight gas, chemical element manufacture,[a] unlocking some of the mysteries of the R-process of stellar nucleosynthesis and probing the composition of the Earth's deep crust, creating reflection seismology Vibroseis data which has helped geologists and follow-on mining company prospecting.[1][2][3]

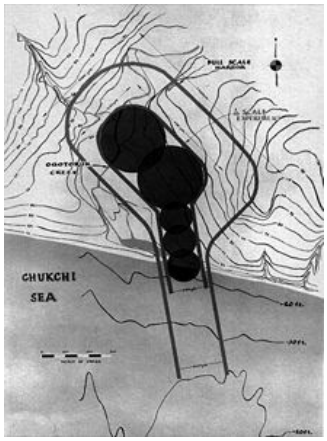
The project's uncharacteristically large and atmospherically vented Sedan nuclear test also led geologists to determine that Barringer crater was formed as a result of a meteor impact and not from a volcanic eruption, as had earlier been assumed. This became the first crater on Earth definitely proven to be from an impact event.[4]

Negative impacts from Project Plowshare's tests generated significant public opposition, which eventually led to the program's termination in 1977.[5] These consequences included Tritiated water (projected to increase by CER Geonuclear Corporation to a level of 2% of the then-maximum level for drinking water) [6] and the deposition of fallout from radioactive material being injected into the atmosphere before underground testing was mandated by treaty.

Rationale

By exploiting the peaceful uses of the "friendly atom" in medical applications, earth removal, and later in nuclear power plants, the nuclear industry and government sought to allay public fears about nuclear technology and promote the acceptance of nuclear weapons.[7] At the peak of the Atomic Age, the United States Federal government initiated Project Plowshare, involving "peaceful nuclear explosions". The United States Atomic Energy Commission chairman at the time, Lewis Strauss, announced that the Plowshares project was intended to "highlight the peaceful applications of nuclear explosive devices and thereby create a climate of world opinion that is more favorable to weapons development and tests".[8][9][*need quotation to verify*]

Proposals



One of the *Chariot* schemes involved chaining five thermonuclear devices to create the artificial harbor.

Proposed uses for nuclear explosives under Project Plowshare included widening the Panama Canal, constructing a new sea-level waterway through Nicaragua nicknamed the Pan-Atomic Canal, cutting paths through mountainous areas for highways, and connecting inland river systems. Other proposals involved blasting underground caverns for water, natural gas, and petroleum storage. Serious consideration was also given to using these explosives for various mining operations. One proposal suggested using nuclear blasts to connect underground aquifers in Arizona. Another plan involved surface blasting on the western slope of California's Sacramento Valley for a water transport project.[5]

One of the first serious cratering proposals that came close to being carried out was Project Chariot, which would have used several hydrogen bombs to create an artificial harbor at Cape Thompson, Alaska. It was never carried out due to concerns for the native populations and the fact that there was little potential use for the harbor to justify its risk and expense.[10]

Project Carryall,[11] proposed in 1963 by the Atomic Energy Commission, the California Division of Highways (now Caltrans), and the Santa Fe Railway, would have used 22 nuclear explosions to excavate a massive roadcut through the Bristol Mountains in the Mojave Desert, to accommodate construction of Interstate 40 and a new rail line.[5]

At the end of the program, a major objective was to develop nuclear explosives, and blast techniques, for stimulating the flow of natural gas in "tight" underground reservoir formations. In the 1960s, a proposal was suggested for a modified *in situ* shale oil extraction process which involved creation of a rubble chimney (a zone in the oil shale formation created by breaking the rock into fragments) using a nuclear explosive.[12] However, this approach was abandoned for a number of technical reasons.

Plowshare testing

The first PNE blast was Project Gnome, conducted on December 10, 1961 in a salt bed 24 mi (39 km) southeast of Carlsbad, New Mexico. The explosion released 3.1 kilotons (13 TJ) of energy yield at a depth of 361 meters (1,184 ft) which resulted in the formation of a 170 ft (52 m) diameter, 80 ft (24 m) high cavity. The test had many objectives. The most public of these involved the generation of steam which could then be used to generate electricity. Another objective was the production of useful radioisotopes and their recovery. Another experiment involved neutron time-of-flight physics. A fourth experiment involved geophysical studies based upon the timed seismic source. Only the last objective was considered a complete success. The blast unintentionally vented radioactive steam while the press watched. The partly developed Project Coach detonation experiment that was to follow adjacent to the Gnome test was then canceled.

A number of proof-of-concept cratering blasts were conducted; including the Buggy shot of 5 1 kt devices for a channel/trench in Area 30 and the largest being 104 kiloton (435 terajoule) on July 6, 1962 at the north end of Yucca Flats, within the Atomic Energy Commission's Nevada Test Site (NTS) in southern Nevada. The shot, "Sedan", displaced more than 12 million short tons (11 teragrams) of soil and resulted in a radioactive cloud that rose to an altitude of 12,000 ft (3.7 km). The radioactive dust plume headed northeast and then east towards the Mississippi River[*citation needed*].

Over the next 11 years 26 more nuclear explosion tests were conducted under the U.S. PNE program. The radioactive blast debris from 839 U.S. underground nuclear test explosions remains buried in-place and has been judged impractical to remove by the DOE's Nevada Site Office. Funding quietly ended in 1977. Costs for the program have been estimated at more than (US) $770 million.[5]

Natural gas stimulation experiment

Three nuclear explosion experiments were intended to stimulate the flow of natural gas from "tight" formation gas fields. Industrial participants included El Paso Natural Gas Company for the Gasbuggy test; CER Geonuclear Corporation and Austral Oil Company for the Rulison test;[13] and CER Geonuclear Corporation for the Rio Blanco test.

The final PNE blast took place on May 17, 1973, under Fawn Creek, 76.4 km north of Grand Junction, Colorado. Three 30-kiloton detonations took place simultaneously at depths of 1,758, 1,875, and 2,015 meters. If it had been successful, plans called for the use of hundreds of specialized nuclear explosives in the western Rockies gas fields. The previous two tests had indicated that the produced natural gas would be too radioactive for safe use; the Rio Blanco test found that the three blast cavities had not connected as hoped, and the resulting gas still contained unacceptable levels of radionuclides.[14]

By 1974, approximately $82 million had been invested in the nuclear gas stimulation technology program. It was estimated that even after 25 years of production of all the natural gas deemed recoverable, only 15 to 40 percent of the investment would be recouped. Also, the concept that stove burners in California might soon emit trace amounts of blast radionuclides into family homes did not sit well with the general public. The contaminated gas was never channeled into commercial supply lines.

The situation remained so for the next three decades, but a resurgence in Colorado Western slope natural gas drilling has brought resource development closer and closer to the original underground detonations. By mid-2009, 84 drilling permits had been issued within a 3-mile radius, with 11 permits within one mile of the site.[15]

Impacts, opposition and economics

Operation Plowshare "started with great expectations and high hopes". Planners believed that the projects could be completed safely, but there was less confidence that they could be completed more economically than conventional methods. Moreover, there was insufficient public and Congressional support for the projects. Projects Chariot and Coach were two examples where technical problems and environmental concerns prompted further feasibility studies which took several years, and each project was eventually canceled.[1]

The 104 kiloton, 1962 Sedan nuclear test formed a crater 100 m (330 ft) deep with a diameter of about 390 m (1,300 ft), as a means of investigating the possibilities of using peaceful nuclear explosions for large-scale earth moving. If this test was conducted in 1965+, when improvements in device design were realized, a "100-fold" reduction in radiation release was considered feasible.[16] The 140 kiloton Soviet Chagan (nuclear test), comparable in yield to the Sedan test of 104 kt, formed Lake Chagan, reportedly used as a watering hole for cattle and human swimming.[17][18][19]

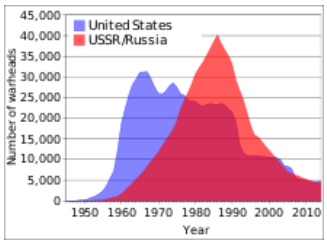
Citizen groups voiced concerns and opposition to some of the Plowshare tests. There were concerns that the blast effects from the Schooner explosion could dry up active wells or trigger an earthquake. There was opposition to both Rulison and Rio Blanco tests because of possible radioactive gas flaring operations and other environmental hazards.[1] In a 1973 article, *Time* used the term "Project Dubious" to describe Operation Plowshare.[14]

There were negative impacts from a select few of Project Plowshare's 27 nuclear explosions, primarily those conducted in the project's infancy and those that were very high in explosive yield.

On Project Gnome and the Sedan test:[5]

> Project Gnome vented radioactive steam over the very press gallery that was called to confirm its safety. The next blast, a 104-kiloton detonation at Yucca Flat, Nevada, displaced 12 million tons of soil and resulted in a radioactive dust cloud that rose 12,000 feet [3,700 m] and plumed toward the Mississippi River. Other consequences – blighted land, relocated communities, tritium-contaminated water, radioactivity, and fallout from debris being hurled high into the atmosphere – were ignored and downplayed until the program was terminated in 1977, due in large part to public opposition.[5]

Project Plowshare shows how something intended to improve national security can unwittingly do the opposite if it fails to fully consider the social, political, and environmental consequences. It also "underscores that public resentment and opposition can stop projects in their tracks".[5]



United States and Soviet Union/Russia nuclear stockpiles. The slow down in the production of nuclear weapons, beginning in the late 1970s in the US, greatly impacted on the economic calculations of peaceful uses of nuclear detonations.

While the above social scientist, Benjamin Sovacool, contends that the main problem with oil and gas stimulation, which many considered the most promising economic use of nuclear detonations, was that the produced oil and gas was radioactive, which caused consumers to reject it and this was ultimately the program's downfall.[5] In contrast, Oil and gas are sometimes considerably *naturally* radioactive to begin with and the industry is set up to deal with oil and gas that contain radioactive contaminants; moreover in contrast to earlier stimulation efforts,[20] contamination from many *later* tests was not a show-stopping issue, historian Dr. Michael Payne notes that it was primarily changing public opinion due to the societal perception shift, to one fearing all nuclear detonations, caused by events such as the Cuban Missile Crisis, that resulted in protests,[21] court cases and general hostility that ended the oil and gas stimulation efforts. Furthermore, as the years went by without further development and the closing/curtailment in output of nuclear weapons factories, this evaporated the existing economies of scale advantage of operation Plowshare that had earlier been present in the United States in the 1950s-60s. It was increasingly found in the following decades that most US fields could instead be stimulated by non-nuclear techniques which were found to be likely cheaper.[22][23]

As a point of comparison, the most successful and profitable nuclear stimulation effort that did not result in customer product contamination issues was the 1976 Project Neva on the Sredne-Botuobinsk gas field in the Soviet Union, made possible by multiple cleaner stimulation explosives, favorable rock strata and the possible creation of an underground contaminant storage cavity.[24][25] The Soviet Union retains the record for the cleanest/lowest fission-fraction nuclear devices so far demonstrated.

The public records for devices that produced the highest proportion of their yield via fusion-only reactions, and therefore created orders of magnitude smaller amounts of long-lived fission products as a result, are the USSR's Peaceful nuclear explosions of the 1970s, with the three detonations that excavated part of Pechora–Kama Canal, being cited as 98% fusion each in the *Taiga* test's three 15-kiloton explosive yield devices, that is, a total fission fraction of 0.3 kilotons in a 15 kt device.[26] In comparison, the next three high fusion-yielding devices were all much too high in total explosive yield for oil and gas stimulation: the 50-megaton Tsar Bomba achieved a yield 97% derived from fusion,[27] while in the US, the 9.3-megaton Hardtack Poplar test is reported as 95.2%,[28] and the 4.5-megaton Redwing Navajo test as 95% derived from fusion.[29]

Jul 8, 2007 (July 8) - VVH-TV News Special Report on PLUM ISLAND

VVHTV / https://youtu.be/3wDyHJWLqyk

VVH-TV News Chief Investigative Reporter Karl Grossman interviews author Long Island native and lawyer Michael Christopher Carroll about his work "Lab 257".

VVH-TV News Chief Investigative Reporter Karl Grossman interviews author Long Island native and lawyer Michael Christopher Carroll about his work "Lab 257". This work takes us on a shocking journey inside the notorious Plum Island biological research facility. Carroll spent five years researching this highly detailed and powerful account of the secretive government installation that sits just off the coast of some of New York's prime real estate, an installation that has had its share of meltdowns, mishaps and downright scary security breaches, including two known releases of deadly viruses into the air.

Owned by the U.S. Department of Agriculture, Plum Island lies just off the coast of the North Fork of Long Island. This otherwise uninhabited, woodsy island has a long history of controversy and secrecy, as Carroll so intricately details, and just may have put the millions of residents of the Tri-State area in utter danger of exposure to fatal animal diseases, including Rift Valley fever, West Nile virus, and even anthrax, time and time again.

Lab 257 is a wake-up call to people to be more aware of what goes on in their own backyards. Labs like these exist all over the country, some more visible than others. Shoring up our crumbling biological research labs and accounting for the hundreds of vials of deadly viruses and microbes might be a better use of our time, our taxes and our energy. Plum Island, and its history of danger to millions of citizens, is proof of that indeed.

VVH-TV News attempted to have an interview with officials from the Department of Homeland Security but were denied.

Buildings 100 and 101 on Plum Island

Established 1954

Budget $16.5 million

Field of research

Foreign animal diseases

biological warfare (until 1969)

Director Dr. Larry Barrett

Location

Plum Island, New York, U.S.

Operating agency United States Department of Homeland Security

Plum Island Animal Disease Center (PIADC) is a United States federal research facility dedicated to the study of foreign animal diseases of livestock. It is part of the Department of Homeland Security Directorate for Science and Technology, and operates as a partnership with the U.S. Department of Agriculture.[1] The facility's director is Dr. Larry Barrett.[2]

Since 1954, the center has been tasked with protecting America's livestock from animal diseases. During the Cold War, a secret biological weapons program targeting livestock was conducted at the site, which ended in 1969 when President Nixon declared an end to the United States' offensive bioweapons program. Today the facility maintains laboratories up to biosafety level 3, but has remained controversial as a result of its high risk work and proximity to the New York metropolitan area.

The facility is slated for closure in 2023, with work moving to the National Bio and Agro-Defense Facility under construction in Manhattan, Kansas.

Location[edit]

See also: Plum Island (New York)

The center is located on Plum Island near the northeast coast of Long Island in New York state. During the Spanish–American War, the island was purchased by the government for the construction of Fort Terry, which was later deactivated after World War II and then reactivated in 1952 for the Army Chemical Corps. The center comprises 70 buildings (many of them dilapidated) on 840 acres (3.4 km²).[3][4] Plum Island has its own fire department, power plant, water treatment plant and security.[3][4] Any wild mammal seen on the island is killed to prevent the possible transmission of foot and mouth disease.[3] However, as Plum Island was named an important bird area by the New York Audubon Society, it has attracted different birds. Plum Island has placed osprey nests and bluebird boxes throughout the island. As of 2008, new kestrelhouses were planned to be added.[5]

History[edit]

In response to disease outbreaks in Mexico and Canada in 1954, the US Army gave the island to the Agriculture Department to establish a research center dedicated to the study of foot-and-mouth disease in cattle.[3]

The island was opened to news media for the first time in 1992.[4] In 1995, the Department of Agriculture was issued a $111,000 fine for storing hazardous chemicals on the island.[4]

Local Long Island activists prevented the center from expanding to include diseases that affect humans in 2000, which would require a Biosafety Level 4 designation; in 2002, the US Congress again considered the plan.[3]

The Wall Street Journal reported in January 2002 that many scientists and government officials wanted the lab to close, believing that the threat of foot-and-mouth disease was so remote that the center did not merit its $16.5 million annual budget.[3] In 2002, the Plum Island Animal Disease Center was transferred from the United States Department of Agriculture to the United States Department of Homeland Security.

In 2003, a whistleblower who voiced concerns about safety at the facility was fired by the contractor he worked for. He had discussed his concerns with aides to Senator Hillary Clinton.[6] A National Labor Relations Board judge found that the contractor, North Fork Services, had discriminated against the whistleblower.[6]

In 2020, the Department of Homeland Security plan to put the island up for auction after the conclusion of laboratory activities in 2023 was blocked by Congress. As part of ongoing COVID-19 pandemic relief legislation, Senator Chuck Schumer of New York negotiated a provision in the CARES Act that protects the island from being sold. Environmentalists had opposed the sale of the island because of its extensive wildlife habitats. After the final draft of the legislation was announced, Schumer said “It would have been a grave mistake to sell and develop Plum Island’s 840-acres of habitat, which is home to many endangered species, that’s why preventing the unnecessary sale requirement was a top priority of these negotiations."[7]

Replacement facility[edit]

See also: National Bio and Agro-Defense Facility

On September 11, 2005, DHS announced that the Plum Island Animal Disease Research Center will be replaced by a new federal facility. The location of the new high-security animal disease lab, called the National Bio and Agro-Defense Facility (NBAF), is being built in Manhattan, Kansas.[8]

NBAF site development before construction in 2013

The plan was controversial almost immediately when it was unveiled, following a cost assessment by DHS and prime contractor Booz Allen Hamilton in which the agency determined that the cost of maintaining or moving the facility would be comparable.

Those conclusions, as well as claims about the safety of the facility proposed were called into question several times, first by a 2009 Government Accountability Office study, which stated that claims by DHS that the work on foot and mouth disease performed on Plum Island can be performed "as safely on the mainland" is "not supported" by evidence.[9]

In 2012, DHS completed a risk assessment of the Kansas site that called the proposed facility "safe and secure".[10] In response, a 2012 review of the risk assessment by the National Research Council called it "seriously flawed".[11]

Despite controversy, the new facility is nearing completion, and transfer of laboratory contents from Plum Island to NBAF is to be complete by 2023. The USDA has named former director of Canada's Centers for Animal Disease Dr. Alfonso Clavijo as the director of the new facility.

Activities[edit]

PIADC's mission can be grouped into three main categories: diagnosis, research, and education.[citation needed]

Since 1971, PIADC has been educating veterinarians in foreign animal diseases. The center hosts several Foreign Animal Disease Diagnostic schools each year to train federal and state veterinarians and laboratory diagnostic staff, military veterinarians and veterinary school faculty.

At PIADC, the U.S. Department of Homeland Security (DHS) and U.S. Department of Agriculture (USDA) work together; DHS' Targeted Advanced Development unit partners with USDA, academia and industry scientists to deliver vaccines and antivirals to the USDA for licensure and inclusion in the USDA National Veterinary Vaccine Stockpile.[citation needed]

USDA Agricultural Research Service (ARS) performs basic and applied research to better formulate countermeasures against foreign animal diseases, including strategies for prevention, control and recovery. ARS focuses on developing faster-acting vaccines and antivirals to be used during outbreaks to limit or stop transmission. Antivirals prevent infection while vaccine immunity develops. The principal diseases studied are foot-and-mouth disease, classical swine fever, and vesicular stomatitis virus.

USDA Animal and Plant Health Inspection Services (APHIS) operates the Foreign Animal Disease Diagnostic Laboratory, an internationally recognized[citation needed] facility performing diagnostic testing of samples collected from U.S. livestock. APHIS also tests animals and animal products being imported into the U.S. APHIS maintains the North American Foot-and-Mouth Disease Vaccine Bank at PIADC and hosts the Foreign Animal Disease Diagnosticians training program, offering several classes per year to train veterinarians to recognize foreign animal diseases.

Research on biological weapons at PIADC ceased when the United States Biological Warfare program was ended in 1969 by President Richard Nixon.[12]

Biological weapons research[edit]

The original anti-animal biological weapons mission was "to establish and pursue a program of research and development of certain anti-animal (BW) agents".[13] By August 1954 animals occupied holding areas at Plum Island and research was ongoing within Building 257.[14] The USDA facility, known as the Plum Island Animal Disease Center, continued work on biological warfare research until the U.S. program was ended by Richard Nixon in 1969.[12] The bio-weapons research at Building 257 and Fort Terry was shrouded in aura of mystery and secrecy.[15][16] The existence of biological warfare experiments on Plum Island during the Cold War era was denied for decades by the U.S. government. In 1993 Newsday unearthed documents proving otherwise and in 1994, Russian scientists inspected the Plum Island research facility to verify that these experiments had indeed ended.[16]

Diseases studied and outbreaks[edit]

As a diagnostic facility, PIADC scientists study more than 40 foreign animal diseases, including classical swine fever and African swine fever.[3] PIADC runs about 30,000 diagnostic tests each year. PIADC operates Biosafety Level 3 Agriculture (BSL-3Ag), BSL-3 and BSL-2 laboratory facilities. The facility's research program includes developing diagnostic tools and biologicals for foot-and-mouth disease and other diseases of livestock.[3]

Because federal law stipulates that live foot-and-mouth disease virus cannot be studied on the mainland, PIADC is unique in that it is currently the only laboratory in the U.S. equipped with research facilities that permit the study of foot-and-mouth disease.[17]

Foot-and-mouth disease is extremely contagious among cloven-hooved animals, and people who have come in contact with it can carry it to animals.[6] Accidental outbreaks of the virus have caused catastrophic livestock and economic losses in many countries throughout the world. Plum Island has experienced outbreaks of its own, including one in 1978 in which the disease was released to animals outside the center, and two incidents in 2004 in which foot-and-mouth disease was released within the center.[6] Foot-and-mouth disease was eradicated from the U.S. in 1929 (with the exception of the stocks within the Plum Island center)[3] but is currently endemic to many parts of the world.

In response to the two 2004 incidents, New York Senator Hillary Clinton and Congressman Tim Bishop wrote a letter to the Department of Homeland Security regarding their concerns about the center's safety: "We urge you to immediately investigate these alarming breaches at the highest levels, and to keep us apprised of all developments."[6]

In 2012, two researchers at the facility, Dr. John Neilan and Dr. Michael Puckette, developed the first Foot-and-mouth disease vaccine which does not require live virus cultures in the manufacturing process, allowing vaccine development to occur safely and legally on U.S. mainland for the first time.[18]

Historic buildings[edit]

Building 257[edit]

Main article: Building 257

Building 257, located at Fort Terry, was completed around 1911. The original purpose of the building was to store weapons, such as mines, and the structure was designated as the Combined Torpedo Storehouse and Cable Tanks building.[19] Fort Terry went through a period of activations and deactivations through World War II until the U.S. Army Chemical Corps took over the facility in 1952 for use in anti-animal biological warfare (BW) research. The conversion of Fort Terry to a BW facility required the remodeling of Building 257 and other structures.[12] As work neared completion on the lab and other facilities in the spring of 1954, the mission of Fort Terry changed.[14] Construction was completed on the facilities on May 26, 1954, but Fort Terry was officially transferred to the USDA on July 1, 1954. At the time, scientists from the Bureau of Animal Industry were already working in Building 257.

Building 101[edit]

The structure is a 164,000-square-foot (15,200 m^2) T-shaped white building.[14] It is situated on Plum Island's northwest plateau on a 10-acre (40,000 m^2) site where it is buttressed by a steep cliff which leads into the ocean.[14] To the east of the building's site is the old Plum Island Lighthouse.[14]

Construction on Plum Island's new laboratory Building 101 began around July 1, 1954, around the same time that the Army's anti-animal bio-warfare (BW) facilities at Fort Terry were transferred to the U.S. Department of Agriculture.[19] Following the transfer, the facilities on Plum Island became known as the Plum Island Animal Disease Center.[19] The USDA's $7.7. million[14] Building 101 laboratory facility was dedicated on September 26, 1956.[19] Prior to the building's opening the area around it was sprayed with chemicals to deter insect or animal life from approaching the facility.[14] Upon its opening a variety of tests using pathogens and vectors were conducted on animals in the building.[14] Research on biological weapons at PIADC did not cease until the entire program was canceled in 1969 by Richard Nixon.[12]

A modernization program in 1977 aimed to update both Building 101 and another laboratory, Building 257, but the program was canceled in 1979 because of construction contract irregularities.[19] PIADC facilities were essentially unchanged until a new modernization began in 1990.[19] Two-thirds of the laboratory facilities inside Building 101 were renovated and operations from Building 257 were consolidated into Building 101.[19] Building 257 was closed, and a major expansion, known as Building 100, was completed on Building 101 in 1995.[19] According to the Department of Homeland Security (DHS), Building 257 currently poses no health hazard.[15]

Controversy[edit]

Conspiracy theories[edit]

Prolific but unfounded conspiracy theories have alleged that Lyme disease, first documented in nearby Lyme, Connecticut, was a biological weapon which originated in the Plum Island laboratory.[20] A discredited 2004 book entitled Lab 257: The Disturbing Story of the Government's Secret Plum Island Germ Laboratory fueled the conspiracy theories.[15][21] Archived specimens show that Lyme disease was endemic well before the establishment of Plum Island laboratory.[20] Additionally, Lyme disease was never a topic of research at Plum Island, according to the US Department of Homeland Security and Department of Agriculture. [22][15]

On July 12, 2008, a creature dubbed the Montauk Monster washed ashore at Ditch Plains Beach near the business district of Montauk, New York. The creature, a quadruped of indeterminate size, was dead when discovered, and was assumed by some to have come from Plum Island as a result of the currents and proximity to the mainland. Palaeozoologist Darren Naish studied the photograph and concluded from visible dentition and the front paws that the creature may have been a raccoon.[23] This was also the opinion of Larry Penny, the East Hampton Natural Resources Director.[24]

Terrorism[edit]

When American educated Pakistani neuroscientist Aafia Siddiqui, a suspected al-Qaeda member, was captured in Afghanistan in July 2008, she had in her handbag handwritten notes referring to a "mass casualty attack" that listed various U.S. locations, including the Plum Island Animal Disease Center.[25] In February 2010, she was convicted of assault with a deadly weapon and attempting to kill U.S. servicemembers and FBI agents who sought to interrogate her.

In popular culture[edit]

- Plum Island and PIADC are the subject of a fictional murder-mystery novel, Plum Island, by Nelson DeMille. DeMille has said, "How could anthrax not be studied there? Every animal has it." While addressing popular culture fears of a germ warfare lab at Plum Island, overall, the facility is presented as doing the job described by the Federal Government—research into animal diseases that would either decimate our national livestock or jump to humans and decimate us. The novel portrays the investigation into the murder of two Plum Island scientists. The motive, initially thought to be germs for terrorists or germs for a biotech company, is really the search for the lost treasure of Captain Kidd, who sailed the waters around Long Island prior to his capture. Kidd's treasure has never been found.
- Plum Island is also referred to in the 1991 psychological thriller The Silence of the Lambs, when the character of Hannibal Lecter is offered a transfer to a different psychiatric institution, as well as the promise of annual week-long supervised furlough to Plum Island, in exchange for his assistance in helping the FBI locate the whereabouts of the missing daughter of a prominent US Senator. It is later revealed in the film that the offer is bogus in the first place, used only as a ruse to elicit Lecter's cooperation.
- The Plum Island facility served as the inspiration for the Mount Dragon research facility in the 1996 techno-thriller Mount Dragon, written by Douglas Preston and Lincoln Child.
- The testing facility at Plum Island is the subject of a novel, The Poison Plum, by author Les Roberts.[26]
- Plum Island and the facility there figure prominently in the 2014 horror novel, The Montauk Monster, by Hunter Shea, in which a bizarre carcass found on a beach in 2008 is an early version of vicious creatures now terrifying the Montauk community.
- The Plum Island facility is mentioned in the television show Emergence as the take off point for a flight that crashes in Southold, New York. This is impossible, as there are no airstrips on Plum Island.

2015 (April) Motherboard video : Inside America's Only Foreign Animal Disease Laboratory: Plum Island

340,098 views•Apr 15, 2016

2016-04-15-youtube-motherboard-inside-plum-island.mp4

Motherboard

About the size of Central Park and a few miles off the coast of Long Island, Plum Island houses the nation's only laboratory that is capable of conducting live research of foot-and-mouth disease, a highly contagious animal disease that hasn't struck the US with an outbreak since 1929.

Because of this, visitors are strictly forbidden unless they've received security protocol from the Department of Homeland Security.

The lab's very location on an island was intentional when it was built in 1954: so nothing reaches its shore, and nothing leaves.

Motherboard gets a rare peek inside the Plum Island Animal Disease Center, and speaks to the scientists tasked with developing foot-and-mouth disease vaccines at one of the most protected labs in the world.

1999 (Sep 22) - NYTimes : "Long Island Lab May Do Studies Of Bioterrorism"

By Judith Miller / Sept. 22, 1999 / Source : [HN01LG][GDrive]

Alarmed at what the Clinton Administration views as the growing threat of biological terrorism to America's food supply, the Agriculture Department is seeking money to turn the Plum Island Animal Disease Center, one mile off Long Island, into a top security laboratory where some of the most dangerous diseases known to man or beast can be studied.

The Agriculture Department already operates here at Plum Island, just across Gardiners Bay from the wealthy Hamptons, a laboratory where such dreaded foreign animal diseases as foot-and-mouth and African swine fever are examined. But the department is seeking $75 million this year and $140 million over

the next two years to upgrade the center to handle even more dangerous animal diseases that can affect humans.

While there are four civilian and military laboratories in America equipped to study such diseases -- technically known as Biosafety Level Four facilities -- their work is focused on germs that primarily affect humans, not domestic animals or plants.

Officials say the proposed expansion and upgrading of Plum Island is part of a new effort by the Clinton Administration to deter terrorists who might spread germs to destroy American crops or livestock for political purposes or financial gain, a threat they now see as equal to that of terrorist attacks aimed at people.

"Given the contribution of crop and animal exports to the nation's prosperity, we must do far more to protect our plant and animal resources," said Senator Richard G. Lugar, the Indiana Republican and co-author of legislation in 1991 and 1996 that provided money to bolster defenses against unconventional terrorism and stop the proliferation of such weapons.

"This is not about food per se; Americans would not go hungry if we were attacked," said Floyd P. Horn, the administrator of the Agricultural Research Service, who helped persuade the Administration to include his agency in January in its counter-terrorism plans and programs. "But such an attack, or even a credible threat, would severely disrupt America's economic and social infrastructure for weeks, if not months or years."

Plum Island, which was once operated by the United States Army Chemical Corps, was designated as an animal-disease research center and transferred to the Agriculture Department in the early 1950's. It is already what scientists call an agricultural "Biosafety Level Three" center, which means that its containment areas, which hold germs dangerous to animals, have filtered air, sealed doors and negative air pressure that prevents germs from leaking out of the labs. Liquid waste is decontaminated.

All who enter the labs wear white lab coats and slippers. After leaving the containment areas, they are required to shower, shampoo their hair, scrub their nails and rinse their mouths, since lethal germs can live in human throats and infect animals up to two days later. To stop viruses or microbes from escaping to the mainland, no clothing or articles, even eyeglasses, are permitted to leave the labs without being soaked in disinfectant, said Dr. Alfonso Torres, the deputy administrator of the Agriculture Department's Veterinary Services Division and former director of the center, who conducted this reporter on a tour.

The building's perimeter is also tightly guarded. While Dr. Torres declined to discuss specific security measures, the shores of this pork-chop-shaped, 840-acre island are said by Federal officials to be monitored by electronic sensors and patrolled by boats and helicopters. **Once a year, deer and other animals that have swum across to the island are killed in what island officials call a controlled hunt.**

Despite an outbreak of foot-and-mouth disease on the island in 1978, which led Plum scientists to abandon their holding areas for large animals, "there has never been a leak of a dangerous pathogens to the mainland from Plum Island," Dr. Torres said.

Moving to the next level of bio safety would require that scientists working with dangerous pathogens wear the protective decontaminated suits portrayed in movies like "Outbreak," and breathe only filtered air pumped into their hoods. Such precautions would allow scientists to work with even more dangerous animal pathogens that can affect humans, like the Hendra virus, which afflicts horses, and the Nipah pig virus, named for the Malaysian village in which it was first isolated this year. The virus has already killed more than 100 people.

"We intend to work closely with local officials and community groups to allay any concerns about safety," said Dr. Horn, who acknowledges that Plum Island has long been shrouded in mystery and plagued by what he and Dr. Torres call unfounded rumors and fears.

The 850-acre island was opened to news organizations only in 1992 in response to concerns about safety at the center. In 1995, the Department of Agriculture was fined $111,000 for illegally storing hazardous chemicals here. Since then, the agency has changed the contractor who operates the island, and there have been no violations.

The extent of the threat posed by agro-terrorism remains in dispute, even within the Clinton Administration. Some scientists and terrorism analysts argue that there is little reason to believe that terrorists would attack American agriculture or livestock.

But intelligence reports increasingly conclude that several countries, including Iraq, have developed germs to attack the food supplies of their adversaries. And senior American officials now believe that an outbreak of screwworm, a parasite that afflicts animals and people, was spread deliberately 14 years ago in Mexico less than 50 miles from the Texas border by workers who were employed in a screwworm eradication program and feared the loss of their jobs.

Although no one was ever arrested or charged in the incident, John Wyss, an Agriculture Department veteran of 25 years who supervised the project from Washington, said that the agency's investigations showed that the outbreak, given its nature and location, had to have been deliberate.

In recent interviews in Russia and Kazakhstan, former Soviet scientists also disclosed that they had developed weapons specifically aimed at crops and livestock. Sadigappar Mamadaliyev, the director of the Scientific Agricultural Research Institute, now in the Republic of Kazakhstan, said that in Soviet times, his was one of four centers dedicated to developing lethal germs as weapons against foreign crops and animals.

"The Soviets here concentrated on cow and sheep pox and blue tongue," he said. "We also cooperated closely with the All-Russian Institute of Animal Health in Vladimir, Russia, which worked on foot-and-mouth disease, and with the Pokrov Institute of Veterinary Virology, which specialized in African swine and horse fevers."

Dr. Mamadaliyev said he had more than 200 strains of dangerous animal pathogens at his institute, whose former scientific staff of 150 has shrunk by half from budget cuts and which is struggling to survive.

There were more than 10,000 Russians working on plant and animal pathogens in the former Soviet germ warfare program, said Ken Alibek, a senior germ researcher who defected to the United States in 1992 and who recently wrote a book, "BioHazard" (Random House), in which he describes the vast scale and depth of the Soviet Union's illegal germ offensive warfare program. Many of those scientists are now without jobs.

Several Russian scientists said that Iranians had recently visited their institutes, some offering huge salaries to work in Teheran and specifically expressing interest in research on animal and plant microbes.

Fueled by growing concern about the proliferation of such expertise and such dangerous germs, President Clinton ordered the Government last year to prepare defenses against germ and other unconventional attacks on the nation's plants and animals. In January, Dr. Horn recruited four former Pentagon intelligence analysts and terrorism experts to form the Agricultural Research Services' first unit to evaluate such threats. In April, the White House formally included the Agriculture Department in the group of agencies that meet regularly under National Security Council aegis to weigh plans to deter or respond to unconventional terrorism, a $2.8 billion effort.

At a public meeting in September in Washington, Dr. Horn discussed his concern about the nation's growing vulnerability to agro-terrorism, mentioning his desire to upgrade Plum Island and make it a centerpiece of the Government's effort to protect the nation's food supply.

Senator Pat Roberts, Republican of Kansas, who is chairman of the Senate Armed Services Subcommittee on Emerging Threats and Capabilities, plans to hold hearings on agro-terrorism in October that will explore the Administration's plans for Plum Island.

Plum Island has 300 employees, 60 of whom are scientists, 70 buildings, many of them closed or deteriorating, independent power and water treatment plants, and a fleet of four boats. Dr. Torres calls the $14.5 million that the Government spends a year on Plum Island a "small investment" in the nation's food security given the $140 billion earned from commodities exports.

As disease after disease has been eradicated, Dr. Torres said, Washington has reduced the budget for veterinary services, which now stands at $116 million a year. Yet demand keeps growing. Agriculture scientists now conduct about 500 investigations of foreign animal diseases a year, more than half of them in birds brought back to the country by the millions of American travelers each year. "Our emergency response systems are becoming very, very thin," Dr. Torres said.

David R. Franz, a vice president of the Southern Research Institute and former director of the United States Army Medical Research Institute of Infectious Diseases, a Biosafety Level Four center, maintains that recent changes in the structure of American agriculture have heightened vulnerability. Increased trade and international travel, reduced genetic diversity in farm animals and the high concentration of animals in yards have increased the risk that highly infectious diseases will emerge and spread, "be they naturally or deliberately introduced, " Dr. Franz said.

The changing nature of terrorism also heightens the threat, says Thomas W. Frazier, president of a consortium of private companies called GenCon.

"There are now hundreds of attacks a year on agricultural targets in the United States, Canada and Britain as a form of violent protest by extremist environmental protection or animal rights groups," he said. Plus, the nation's intelligence analysts expect increased assaults by state-sponsored bioterrorists, militant religious cults and other extremist groups on such targets as food and agriculture.

The largest animal disease outbreak in America in recent history, wrote Corrie Brown, the head of the pathology department at the University of Georgia's College of Veterinary Medicine, was one caused by avian influenza that erupted in Pennsylvania some 15 years ago. A deadly viral variant spread quickly, prompting Agriculture officials to kill all exposed chickens at a cost of $63 million to the Federal Government. Economists estimated that had they not been killed, the cost to United States agriculture would have been as high as $5.6 billion. Even so, Dr. Brown concluded, the six-month outbreak caused poultry prices to rise by $349 million.

1999 (Nov 28) - NYTimes : "Microscopic Guests On a Small Island Raise Big Fears; A Tour of Plum Island, a Center for Study of Viruses That's Being Considered for Even More Deadly Bugs"

NOTE - WHY MENTION NIPAH HERE ?

By John Rather / Nov. 28, 1999 / Source : [HN01LH][GDrive]

IN a high-security laboratory suite at the Plum Island Animal Disease Center, Dr. Luis Rodriguez, a microbiologist, was explaining the "layer upon layer of precautions" that researchers took to contain the highly infectious animal viruses they study.

After samples of infected animal tissue arrive inside air-tight transfer boxes, Dr. Rodriguez explained, they go into a specially designed cabinet with an elaborate air-filtering system.

Donning a surgical smock and snapping on protective gloves, Dr. Rodriguez reached inside the cabinet, moving with all the care of an explosives expert disarming a bomb.

Every instrument, cleanser and container he would need was meticulously laid out so his hands could stay inside until he was done working with vials and bottles that might have contained virus samples. "Everything you do requires planning," he said.

And then, as he walked away from the cabinet, he dropped one of the bottles.

There was no harm done. The bottle was closed and empty, and should have withstood the short fall in any case. Even if a virus had escaped, the negative pressure in the room, and indeed throughout the entire biocontainment area of the Plum Island center, would have captured any contaminated air and routed it into the lab's air-filtering system.

But still, as the bottle clattered to the floor it sounded a reminder that even in the most careful hands, accidents do happen, and that even in the most controlled environment, uncontrollable events may occur.

As the federal Agriculture Department considers whether to seek congressional approval to make the 45-year-old Plum Island center the only government laboratory in the country to study extremely virulent animal diseases that can also kill humans, questions of safety and security are suddenly looming large.

The department and its highest-ranking experts have said that an animal disease center with labs that have the highest security rating, biosafety level four, are an absolute necessity for combating viruses that could attack cattle, pigs, sheep and other domestic herds, with the potential to devastate the country's $90 billion livestock industry.

Some of the diseases -- the kind scientists call zoonotic -- can also spread to humans with lethal effects, making them a double threat if they were used in a bioterrorist assault.

Fears of bioterrorism prompted the Clinton Administration to direct the Agricultural Department and other agencies to take steps to protect the country,

and changes at Plum island could be part of the response.

Because Plum Island is now rated at biosafety level three for studying foreign animal viruses, the department has made no secret that the island is its first choice for the level four labs.

As the wheels begin turning, critics are already questioning the wisdom of importing viruses for which there are no known cures to an island off crowded Long Island and 95 miles from Manhattan.

Robert S. DeLuca, the president of the Group for the South Fork, said the level four labs were a remarkably bad idea for an island less than 15 miles from the Millstone nuclear power complex in Waterford, Conn., in the path of hurricanes and in an area of Long Island that could not be evacuated in an emergency.

"Short of being on a geological fault, I don't think you could find a worse place," he said.

In anticipation of such criticism, the seldom-visited laboratory invited local officials and members of the news media for a tour earlier this month to learn more about the 840-acre island fortress, which is ringed with signs warning away intruders. Even before arriving on one of the laboratory's boats, from Orient Point or Old Saybrook, Conn., the visitors had been told they had to be prepared to strip naked before entering a realm of inner-sanctum labs and animal pens, to shower thoroughly upon exiting and to sign an oath promising to avoid all animals except domestic dogs and cats for five days.

In the lobby of the lab's main research building, displays posted on the crisp white walls told, among other things, of the center's genesis in the 1950's as the country's front line against foot-and-mouth disease, a disaster for American cattle herds in the 1920's and still a problem in the world today.

In a spacious conference room, Wilda Martinez, the area director for the Animal Research Service, one of two Agriculture Department agencies at Plum Island, extended a welcome but minced no words.

Recent news reports, she said, have been inaccurate in their details, and have blurred the reasons the level four labs are needed. "Bioterrorism aside," she said, "it is apparent that the protection afforded by ocean barriers and geographic separation will no longer prevent the introduction of foreign animal diseases."

Dr. Alfonso Torres, a native of Colombia and the deputy administrator of the Animal and Plant Health Inspection Service, the other Agriculture Department agency at Plum Island, followed with a slide lecture intended to leave no doubt about the importance of the lab in protecting agriculture, the county's largest industry.

[Dr. Peter Keith Murray (born 1946)], the director of the Animal Research Service national animal disease center in Ames, Iowa, said Plum Island was already equipped to protect the public from exposure from even so dangerous a virus as the Nipah virus. That virus, hitherto unknown, spread among domestic swine in Malaysia, and then to farmers and farm workers. More than 250 people died and millions of swine were slaughtered to eradicate the outbreak, he said.

[Dr. Peter Keith Murray (born 1946)], a former head of what is now the world's only level four animal disease lab near the Australian city of Geelong, said the Nipah virus could be studied now in level three labs at Plum Island without endangering the public because lab safety systems would prevent the virus from "escaping into the environment."

But safety level three was "not good enough," he said, to protect the laboratory's staff of 14 research scientists and more than 160 other employees, and therein lay the need for the upgrade to level four.

Researchers and others working with viruses in level four labs wear so-called "space suits" that are connected to external air supplies. The suits are not required in level three labs.

[Dr. Peter Keith Murray (born 1946)] and others said the need for the level four labs had been urgent and obvious for some time. "Nobody is sure why, and there's a lot of speculation, but we are encountering more and more of these new diseases over the past 15 years," said Dr. Murray, citing the Nipah virus and mad cow disease in England as examples.

"Frankly, given the nature of emerging threats from around the world and here at home, it is very clear that U.S.D.A. must have access to BSL4 facilities," he said. "We're all here today because of the talk Plum Island might be that site."

With that, and following a safety lecture by a Plum Island safety officer, Thomas Sawicki, men and women on the tour entered separate locker rooms to strip down for a naked walk into the biocontainment area.

There, the visitors were issued underwear, socks, Nike footwear and one-time-use filmy white Tyvek suits. Scientists and staff, who had been clad in jackets and ties or skirts and pant suits in the conference room, reappeared in informal attire including mechanic's jump suits and hospital-style tunics.

Group by group, the press contingent made the rounds through rooms and corridors that few outsiders ever see.

Among the most jarring were the pens where horses, hogs and sheep that arrived disease-free on the island are infected with viruses to study the result. A forlorn pig foraged behind a thick glass window in one of the sealed pens.

The animal supervisor, Jeff Babcock, ushered visitors into an empty pen with a floor drain. The metal door opened with a hiss as an air gasket sealing it deflated, revealing a barren, perfectly spotless cement room. A pair of ear plugs on a table told of conditions when the pen was occupied. About 250 large animals are brought to the lab each year. None leave.

Mr. Babcock said the animals met a common end: Death by a pistol bullet or drug overdose. Carcasses, dung and bedding are burned, and the ashes burned again, in specially designed double-chamber incinerators that vent, ultimately, to the atmosphere after extensive filtering.

Dr. Douglas Moore, a tour group leader and microbiologist, said there was no risk to the public from air emissions. "If anything escaped, it would be diluted to such an extent that it would not be considered a risk," he said.

The lab has its own drinking wells, oil storage tanks and sewer treatment plant. Under a state permit, it can dump 60,000 gallons of effluent into Long Island Sound each day. Now the lab is planning to build a five-megawatt power plant to rid itself of dependence on mainland power and its backup generators.

In an eerie birth-and-death sequence, visitors enter the biocontainment area naked and empty-handed and depart the same way. Even notes are left, to be faxed out from within.

All else that is to be removed or disposed of is baked in autoclaves or incinerated, treated in caustic baths, fumigated with formaldehyde or otherwise

All else that is to be removed or disposed of is baked in autoclaves or incinerated, treated in caustic baths, fumigated with formaldehyde or otherwise scoured or disinfected to kill any living cell.

The lab also says it pays close attention to what comes into the lab, and how.

On the tour Carmen Farrugia, a lab employee involved with shipping and receiving, demonstrated how viruses are shipped. First, a small amount of virus contained in a small vial was placed in a slightly larger vial with absorbent material, which in turn was placed in another container with more absorbent material.

The container was then packed in a box with a hard plastic liner, and capped with a spongelike material and often with dry ice. The box, she said, was designed to withstand a fall of 27 feet. The boxes, which bear labels warning of an infectious substance inside, are shipped by air.

"This gets shipped like cargo, like you were sending a package to grandma or something," Ms. Farrugia said.

In this way, viruses collected from other parts of the world were transported to Kennedy International Airport, where they are met by couriers with cell phones, decontamination kits and training in cleanup. The couriers then drove east on the Long Island Expressway "except when there are traffic jams," Ms. Farrugia said, eventually taking Route 25 down the North Fork to Orient Point; the packages then traveled by boat to Plum Island.

Dr. Michael Kiley, the Animal Research Service safety officer at the lab, said the packages were designed to withstand a plane crash. Dr. Kiley also said that other government agencies, including the Federal Bureau of Investigation, would be involved in assuring shipment and lab security if Plum Island was upgraded to a level four center.

At the conclusion of the tour, a young staff employee directed visitors to strip again, blow their noses, scrub under their nails and spit. Most managed the last step no better than Rose in the movie "Titanic."

After a minimum three-minute shower and hair washing under strong water pressure, visitors at last emerged from the biocontainment area.

Then, after a short tour of the island and its now crumbling gun emplacements and unused barracks and buildings -- including one building for the island's only fire truck -- the visitors boarded the boat back to the mainland, impressed by the island's raw beauty and sweeping views of Gardiners Island, Little Gull Island, Great Gull Island, Montauk Point, the North Fork and, on the Connecticut shore lighted up by the late afternoon sun, the Millstone nuclear power plants.

The surf had grown far rougher as the sun set, and the boat back to Orient Point rose and fell like a bucking bronco in slow motion, sending out huge billows of salt spray.

It was a cold comfort to know any virus aboard would perish along with the passengers if the boat sank.

Francis Allan Plummer (born 1952)

Wikipedia Frank Plummer

ASSOCIATIONS

- Dr. Gary Pignac Kobinger (born 1969)

Born 2 December 1952 - [HK001T][GDrive]

Saved Wikipedia - See [HK001T][GDrive]

Francis Allan Plummer OC OM FRSC (2 December 1952 – 4 February 2020) was a Canadian scientist, academic and HIV/AIDS researcher. He was "a recognized specialist in infectious diseases whose work influenced public health policy in Canada and abroad".[1] He was Distinguished Professor Emeritus of Medicine and Medical Microbiology at the University of Manitoba and Scientific Director General, National Microbiology Laboratory, Public Health Agency of Canada. From 1984 until 2000 he worked in Nairobi, Kenya studying sexually transmitted infections. During his time in Kenya, his research described the heterosexual epidemiology of HIV and the role of male circumcision in reducing HIV infection risk in men. While at the National Microbiology Laboratory, he led the Canadian laboratory response to SARS, the H1N1 pandemic and oversaw the development of the successful VSV EBOV vaccine for Ebola viral hemorrhagic fever. Dr. Plummer was working to develop an HIV vaccine[2] at the time of his death, and was believed to be the first recipient in North America to receive **DBS** (deep brain stimulation) to treat alcohol-use disorder, in an experimental trial.[3][4][5]

Honours

In 2006, he was made an Officer of the Order of Canada.[1] In 2009, he was made a Member of the Order of Manitoba in recognition for being "an internationally renowned physician-scientist and expert in infectious diseases who has significantly contributed to global health".[6] In 2014, he was awarded the Killam Prize for AIDS research.[7] In 2012, he was awarded the Royal Society of Canada's McLaughlin Medal, awarded "for important research of sustained excellence in medical science".[8] He was the recipient of the Canada Gairdner Wightman Award in 2016. As well as many other awards,[specify] Dr. Plummer has honorary degrees from the University of Calgary, McMaster University and the University of Windsor.

Virus lab kept busy

BY SCOTT EDMONDS
Canadian Press

WINNIPEG — Canada's only lab capable of handling the world's deadliest viruses has been mightily tested in the last few weeks, but its officials say it has passed with flying colours.

"It's been an incredibly hectic time," said Dr. Frank Plummer, head of the microbiology laboratory at the Canadian Centre for Human and Animal Health.

Scientists at the high-tech, high-security centre in Winnipeg have been working virtually around the clock, most recently to see if a woman visitor from Africa brought the dreaded Ebola virus into the country.

The woman remains critically ill in a Hamilton hospital, but health authorities no longer fear she may have carried Ebola or a similar disease to North America.

"There's never been an incident like this woman from Congo before," Plummer said Monday.

"There are contingency plans in place to deal with these kinds of things and I think we dealt with it well this time. I'm particularly proud of the job the Level 4 program did here."

The most deadly pathogens, such as Ebola, are classified as Level 4 viruses. They must be handled in special facilities that have the ultimate in safeguards to prevent accidental contamination.

About 16 Level 4 viruses have been identified worldwide so far, most originating in Africa or South America.

The Winnipeg centre, which opened in 1999, is one of only about 15 in the world.

"We were ready for this," said Dr. Heinz Feldmann, head of the special pathogens section.

"We hope it's not going to happen often or soon again."

The Hamilton incident followed on the heels of health scares in Toronto, Ottawa and Victoria posed by feared bioterrorist attacks.

Packages containing mysterious substances were sent to government offices in Toronto and Ottawa, and to a Wal-Mart in the Victoria area. In all three cases, the substances were examined at the Winnipeg lab and turned out to be harmless.

"Most of our colleagues in the United States . . . have handled many hoaxes," said Kathryn Bernard, the head of the special bacteriology section. "They're not very common in this country."

Mar 11, 2011 / TEDx Talks

Regarded internationally as a world- leading HIV/AIDS researcher and specialist in infectious diseases, Dr. Frank Plummer's work has influenced public health policy in Canada and around the world. He received his medical degree from the University of Manitoba in 1976 and studied internal medicine and infectious diseases at the University of Southern California, the University of Manitoba, the University of Nairobi, and the Centers for Disease Control in Atlanta. In 1984, Dr. Plummer took on a health research post in Nairobi, Kenya for over 17 years where his work led to some of the research fundamental to documenting the emerging HIV epidemic in Africa. Dr. Plummer's ground-breaking HIV/AIDS research, particularly on understanding natural immunities to the virus, is now the basis of work toward developing an HIV vaccine. He is currently the Chief Science Advisor and Scientific Director of the Public Health Agency of Canada's National Microbiology Laboratory in Winnipeg, Manitoba.

2016 (Nov) - Two of the world's leading HIV/AIDS experts are among the 2016 Gairdner Award recipients.

ArticleFigures & DataInfo & MetricseLetters PDF

Abstract

A new coronavirus has been implicated as the causative agent of severe acute respiratory syndrome (SARS). We have used convalescent sera from several SARS patients to detect proteins in the culture supernatants from cells exposed to lavage another SARS patient. The most prominent protein in the supernatant was identified by matrix-assisted laser desorption/ionization time-of-flight mass spectrometry (MALDI-TOF MS) as a ~46-kDa species. This was found to be a novel nucleocapsid protein that matched almost exactly one predicted by an open reading frame in the recently published nucleotide sequence of the same virus isolate (>96% coverage). A second viral protein corresponding to the predicted ~139-kDa spike glycoprotein has also been examined by MALDI-TOF MS (42% coverage). After peptide N-glycosidase F digestion, 12 glycosylation sites in this protein were confirmed. The sugars attached to four of the sites were also identified. These results suggest that the nucleocapsid protein is a major immunogen that may be useful for early diagnostics, and that the spike glycoprotein may present a particularly attractive target for prophylactic intervention in combating SARS.

2020 (Feb 04) Renowned Canadian scientist Frank Plummer dies in Kenya, where he led HIV breakthroughs

Plummer, 67, was infectious disease specialist who achieved international influence

CBC News · Posted: Feb 04, 2020 1:26 PM CT / Source - [HM0009][GDrive]

video - [HM000B][GDrive] <--- 1987 video , 5 minutes long

World-renowned scientist Dr. Frank Plummer of Winnipeg has died.

PHOTO - Frank Plummer was recently reunited with a group of women he worked with in the past on his last visit to Kenya in 2020.
[HM000A][GDrive]

Plummer, 67, was in Kenya, where he was a keynote speaker at the annual meeting of the University of Nairobi's collaborative centre for research and training in HIV/AIDS/STIs.

Dr. Larry Gelmon, who helped set up that meeting, said Plummer collapsed and was taken to hospital in Nairobi, where he was pronounced dead on arrival.

No confirmed cause of death has yet been released.

Plummer was born and raised in Winnipeg, where he headed up Canada's National Microbiology Laboratory for several years.

He was also involved in an innovative research partnership between the University of Manitoba and the University of Nairobi, established before the world was very aware of HIV/AIDS.

"He helped to identify a lot of the key factors that are involved in HIV transmission in the early days," said Keith Fowke, a professor in the medical microbiology and infectious diseases department at the University of Manitoba.

Before that partnership, scientists didn't know HIV could be passed on to women or to babies through breast milk.

"He developed a lot of interventions that helped save hundreds of thousands of lives across the world," Fowke added. "Frank was definitely a brilliant mind."

As a specialist in infectious diseases, Plummer's work influenced international public health policies.

"Frank dedicated decades of his time to Africa and led world-changing breakthroughs in HIV prevention," Matthew Gilmour, director general of the National Microbiology Lab, wrote in an internal email to staff of the Public Health Agency of Canada on Tuesday.

"Of course, the most noteworthy breakthrough that he and his team made was the finding of female sex-workers who were resistant to HIV. The gift these women have given science in the years since has been unparalleled.

"Frank had just had a joyful reunion with many of them a couple days before his passing."

Another colleague, Dr. Allan Ronald, said Plummer's death is tragic and a loss for science.

"He was so hopeful that he was on the path that would end with discovery of the HIV vaccine — the road he had started down almost 30 years ago," Ronald said.

University of Manitoba president and vice-chancellor Dr. David Barnard said Plummer had a great impact on global public health.

"He was admired and regarded highly by academics and researchers around the world, and his legacy of seeking to develop an HIV vaccine remains one of the landmarks of infectious disease prevention," Barnard said.

Dr. Theresa Tam, Canada's chief public health officer, took to Twitter to remember Plummer.

Plummer was most recently living in Toronto, where he underwent experimental brain surgery to fight alcohol addiction.

He was believed to be the first person in North America to undergo deep brain stimulation for that purpose.

"Frank was bigger than life. His physical presence and intelligence contradicted the fact that he was actually a fairly quiet and shy guy," Gilmour's memo says.

"Science will continue to build on his accomplishments and improve public health in the world for many years to come."

Plummer was in Kenya with his wife, Jo Kennelly, and his stepdaughter Imogen, and the family had just enjoyed time on safari, Gilmour's memo says.

2019 (Dec 15) Canadian scientist undergoes novel brain stimulation treatment for alcoholism

Article - [HM0006][GDrive] / Video - [HM0008][GDrive] <--- Great video !

Published Sunday, December 15, 2019 10:00PM EST

[HM0007][GDrive]

TORONTO -- Like millions of Canadians, Dr. Frank Plummer used alcohol simply to relax after work. Or so he told himself.

Only after he became ill with liver failure was he forced to confront a painful reality: he suffered from alcohol-use disorder.

“I guess I was in denial,” Plummer told CTV News. “It’s pretty obvious now that I look back that I had a problem.”

Plummer had an illustrious career as a physician, researcher and the scientific director of Canada’s National Microbiology Lab in Winnipeg. He worked on the front lines of medical crises such as the AIDS epidemic. His groundbreaking work studying HIV/AIDS in Nairobi revealed that the disease did not only affect gay men, as was thought at the time, but could impact heterosexuals and women. He guided Canadian public health through Ebola scares, SARS and the arrival of the pandemic swine flu strain, H1N1, in 2009. As a result of his decades of work the 67 year old has won multiple awards, including the Order of Canada.

But while he was working tirelessly to improve the lives of others, Plummer was also using whiskey -- up to 20 ounces a night -- to deal with the resulting stress.

“I used to think about alcohol all the time,” he said, admitting that part of his brain used to be constantly planning how he’d get more. He thought he was managing it because he never drank on the job.

“I think I was a high-functioning person with a problem with alcohol,” he said.

In 2012, he suddenly became sick: “My belly blew up, and I found I had cirrhosis and end-stage liver disease.”

He was given a liver transplant in 2014. The new organ was “magical,” he said, but the then-retired scientist soon discovered that without “that adrenaline from responding to some pandemic somewhere,” to distract him, he couldn’t stop himself from returning to drinking. And the problem simply became worse and worse from there.

His wife Jo Kennely told CTV News that at first she couldn’t comprehend it.

“I kept on thinking as we went through this, you know, he’s the smartest man in Canada,” she said. “He’ll be able to figure this out, we’ll get through this, he’ll want to survive, he’ll want to stop, he’ll want to do these things.”

Eventually, she realized “it doesn’t matter how smart you are, doesn’t matter how educated you are. It affects everyone. No one is immune from this disease.”

Plummer underwent therapy, alcohol treatment programs, AA meetings. Nothing, he says, worked for long, and he was not a candidate for a second liver.

“If I didn’t get the drinking under control, I was going to die,” Plummer said. “And I didn’t want to die.”

With his options running out, Plummer agreed to be the first person in North America to test an entirely new way of stopping alcohol addiction -- by treating it with deep brain stimulation.

THE TREATMENT

In December of 2018, doctors at Sunnybrook Health Sciences Centre implanted two electrodes into Plummer’s brain while he was still awake. He was able to talk and answer questions during the surgery.

The electrodes are connected to a device similar to a pacemaker in the upper right side of his chest. It sends electrical impulses deep into the brain to an area called the nucleus accumbens, which is linked to addiction and alcoholism and plays a central role in the brain's reward circuitry.

“So we’re inserting electrodes directly into that region of the brain in an effort to reset its activity, to recalibrate it in some way,” Lipsman said. The device is controlled by an external monitor that Plummer and his doctors can adjust and turn on and off.

The study’s goal, Lipsman says, is to raise awareness of the disease, and to validate the growing awareness that alcohol addiction is likely “a brain-based illness.

“And there should be no better way to treat a brain-based illness than a brain-based intervention.”

According to Lipsman, the pilot study now underway will test six patients like Plummer who have treatment resistant alcohol-use disorder, and for whom all other therapies have failed. [...]

It’s also the top cause for hospitalization linked to substance abuse across the entire country, accounting for more than half of hospital stays caused by

substance abuse. Ten Canadians die in hospitals per day due to substance abuse -- and three out of four of those deaths are due to alcohol, according to figures from the Canadian Institute for Health Information.

For Plummer, this new trial didn't just mean a chance to get help for himself, but a chance to contribute to the science aimed at minimizing those deaths.

"I spent my whole life doing research, and here's a different way of doing research," he said. "Be a participant, rather than the study director."

THE IMPACT

A year later, the stimulator is on 24-7 and Plummer reports that he no longer is obsessed with thoughts of drinking.

"It's given me my life back," he said.

His wife said that while the treatment may not be a "cure," it has acted as one for the family as a whole.

"It's a cure for us," she said.

Before, she said, the need for alcohol was like "an itch," that Plummer was compelled to scratch at, and had to address before he could think about anything else, but "now … that itch is gone.

"It's like night and day."

Lipsman said that their test trial only sought out subjects whose alcohol addiction had gotten so bad that it was verging on fatal.

"Frank is really a typical example," he said. "Somebody that has been through a transplant, been through medical treatment and despite that is still affected by his addiction. So those are the kind of patients that we enroll for this particular trial."

There are risks of infection and bleeding with brain surgery, but so far researchers say the treatment seems to be relatively safe and the first three patients treated are doing well.

"There are encouraging signs that we're having a meaningful impact on their drinking behavior and on their mood as well," Lipsman said.

Currently, Sunnybrook is the only centre in the world actively performing deep brain stimulation on patients with treatment-resistant alcohol-use disorder. As the study continues, researchers will also be monitoring changes in brain structures and activity. The study is currently being funded by philanthropic grants, which cover the cost of medical care and follow-up as well as the cost of the equipment. The stimulator alone can run anywhere from $15,000 to $20,000.

Deep brain stimulation is widely used to treat Parkinson's disease and also depression. It's also being tested for eating disorders, obsessive compulsive disorders and Alzheimers. Dr. Lipsman says there may soon be attempts to try DBS as a treatment for other forms of addiction outside of alcohol use disorder.

Plummer is a prime example that addiction can strike anywhere -- it targets not only those who are visibly struggling, but also those who appear to be successful in all avenues of their lives. The misconceptions surrounding who is affected by addiction are just one of the reasons that Plummer says "it's important to talk about alcohol-use disorder."

He told CTV News that there is "a stigma," surrounding the illness.

"Training as a medical doctor, I didn't think much of people that had problems with alcohol," he said. "And I never thought of myself like that."

Although he admitted to judging those who struggled with addiction in the past, he said his experience was eye-opening.

"[Alcohol addiction] will ultimately kill you if you don't deal with it," he said. "It just about killed me." He added that he thought long and hard about taking his story public, but decided to talk about his struggle with alcohol-use disorder, "to try to destigmatize it."

These days, Plummer, who now lives in Toronto, says he has a new zest for life. He has reconnected with family and -- most importantly -- is diving back into his passion: infectious diseases.

He is preparing to push ahead with an experimental vaccine against HIV infection, and is working on writing a memoir.

"I'm happier than I've been in many, many years," he said.

Source - [HN01B3][GDrive]

Ben T. Plymale, 55, a **vice president of the Boeing Aerospace Co.** and a former Pentagon official who was deputy head of the Reagan transition team at the Defense Department, died Aug. 8 in a hospital in Rivers Inlet, British Columbia, after a heart attack.

A resident of Seattle, Mr. Plymale was on a fishing trip in Canada when he was stricken.

He was deputy director for research and engineering for strategic and space systems at the Defense Department from 1968 to 1972. In addition to serving as deputy team leader of transition at the Pentagon, following Reagan's election as president in November 1980, he was also cochairman of Reagan's Defense Budget Committee.

Mr. Plymale joined the Boeing Co. in 1950 and became an authority in strategic defense systems. He was one of the Boeing managers who developed the Minuteman missile program. He was the author of technical works, dealing with gyro-dynamics and navigation systems of missiles, many of which are still used in university instruction.

After leaving the Pentagon in 1972, he returned to Boeing as space systems division vice president. From 1974 to 1979, he was vice president for business development, and was Boeing's vice president for advanced missile programs at the time of his death.

He was reared in Oregon and earned a bachelor's degree in physics and mathematics at the University of Portland. He served in the Navy during World War II.

Survivors include his wife, Susan, a sister, and 10 children, all of Seattle. [...]

Chapter 4 THE ASYMMETRIC WARRIOR

[...]

As one connection led to another, [Thomas P] Rona himself came to Washington a few years later**. Ben Plymale, a vice president at Boeing and former defense official from the Nixon administration, was Rona's friend and mentor.** Plymale introduced Rona to William van Cleve, a professor at the University of Southern California. Van Cleve had been an adviser to Ronald Reagan during the 1980 campaign and was directing the Defense Department transition team for the new administration. Rona started working for van Cleve, and soon caught the eye of [**William Robert Graham (born 1937)**], who was also working on the transition and was about to become Reagan's new director of the White House Office of Science and Technology Policy. Graham offered Rona a job as deputy director. [...]

Boeing, General Dynamics Join Bids

1973-01-09-the_miami_herald-sec-b-pg-1-clip-boeing

COCOA BEACH — Boeing officials announced Monday that they'll join with General Dynamics Corp. to bid on a contract to develop external fuel tanks for the space shuttle program.

The joint aerospace announcement makes them the first in the industry to make a bid for the project, which will be to design the fuel tank system on America's most advanced spacecraft.

Boeing Vice President and General Manager Ben T. Plymale made the announcement in Washington along with representatives of General Dynamics, who would act as subcontractors to Boeing on the project.

Ex-Test Pilot Gets New Job

SEATTLE (AP) — A former Boeing test pilot has been named vice president-general manager of the Boeing Aerospace Company's Strategic Systems Group.

Lionel D. Alford succeeds Ben T. Plymale, who will head a newly established Boeing unit, Requirements and Market Analysis.

Alford will head programs involving the Minuteman short range missile, air launch cruise missiles, Advanced Systems Development and Spacecraft Branch.

Boeing confirms Pentagon probe

SEATTLE (AP) — The security classifications of six Boeing Co. employees have been suspended pending a Pentagon probe of possible security leaks, the airplane manufacturer has confirmed.

Boeing spokesman Pete Bush said Thursday the firm was cooperating fully with the government's investigation, "but we aren't prejudging our employees because we question whether any criminal laws have been broken."

He confirmed that six Boeing employees, including a vice president, had lost their security clearances pending the investigation.

The Boeing vice president was identified as Benjamin T. Plymale, aerospace marketing chief and a former deputy assistant secretary of defense for strategic and space systems.

The Wall Street Journal on Thursday identified three other Boeing officials involved as William H. Jacaway, a Plymale assistant; Charles Welling, manager of Boeing's aerospace office in Washington, D.C., and James L. O'Rourke, a marketing representative in the Washington office.

1979-03-02-longview-daily-news-longview-washington-pg-9-clip-boeing-pentagon-probe

The Pentagon is referring the case to the Justice Department for possible criminal prosecution, the Journal said.

Boeing officials refused to confirm the names, but Bush said two of those involved were secretaries.

Jacaway was working in Boeing's Kent offices Thursday but couldn't be reached for comment. Welling and O'Rourke were on "administrative leave," said a Boeing spokesman in Washington, D.C.

Richard Albrecht, Boeing vice president and general counsel, issued a written statement saying the firm always demanded strict adherence to security regulations and that Boeing had "cooperated as fully as possible" with the probe.

"The investigation does not involve an attempt by Boeing to gain a competitive advantage in any overpayment program," and no classified information, to the best of the company's knowledge, was conveyed "to any unauthorized person," Albrecht added.

The Journal quoted unnamed investigators as saying the Boeing employees handled the classified information in such a way — transmitting it over a normal telephone line — that "Pentagon officials believe it probably was intercepted by Soviet intelligence agents."

The Journal also said the information involved came from a document the Pentagon was preparing last March for President Carter on whether the administration should build a new land-based intercontinental ballistic missile. Billions of dollars in potential business for Boeing hinges on the administration's ultimate decision.

The administration is still trying to decide whether to build a new missile, called the MX, or proceed with some cheaper alternative to modernizing the nation's strategic arsenal. The Air Force wants to deploy the MX and make it mobile.

At the time of the reported security breach, Boeing was competing to become the prime contractor for the MX contract. Another company later was chosen, but Boeing could still gain large contracts if the administration goes ahead with the mobile deployment program.

The Journal said that earlier this year, O'Rourke, testifying under a grant of limited immunity from criminal prosecution, told investigators he had read the secret draft of the document destined for President Carter, made notes and prepared a summary which was sent by telecopier from Boeing's Washington office to its Seattle headquarters.

Pentagon sources presume, according to the Journal, that the information "was routinely collected by Soviet agents, who, they say, monitor telephone lines to and from defense contractors."

The information in the memo seen by O'Rourke included a suggestion that involved placing the Lockheed Corp.'s Trident missile, designed for launch from submarines, into existing Minutemen silos. Such a move would reduce Boeing's opportunities to participate in the program.

Missile-X Data Available for the Asking, General Says

By ARNOLD MARKOWITZ
Herald Staff Writer

The Boeing Co. might have been able to use normal channels to get top-secret missile information that the Defense Department accuses it of obtaining and transmitting by unauthorized means, an Air Force general said.

The way a Boeing representative got the information and sent it to his office in Seattle has caused an investigation and the suspension of six Boeing officials' security clearances. It also has made the giant aerospace company vulnerable to possible criminal prosecution.

ACCORDING to the New York Times and the Wall Street Journal, the Defense Department believes the unauthorized transmission of the information by normal telephone lines probably permitted it to fall into Soviet hands.

All the same, Brig. Gen. Guy Hecker said his Pentagon office is, "not worried about it."

Hecker, in Homestead Wednesday for a speech, is the Air Force special assistant for Missile X matters.

Missile X, better known as the M-X missile, is planned as a potential replacement for Minuteman III.

A Pentagon investigative report described last Friday by The New York Times said Boeing marketing representative James O'Rourke learned a top-secret Defense Department memo about the M-X system was being prepared. He is said to have tipped off his boss, Benjamin T. Plymale.

AT THE time, Boeing hoped to become the missile system's prime contractor, a job later awarded to Martin-Marietta. O'Rourke persuaded an Air Force lieutenant colonel to let him see a copy of the memo, and to let him make notes.

O'Rourke, cooperating with investigators under a grant of limited immunity, said he wrote a summary of the memo and sent it to Boeing headquarters by telecopier. The Defense Department believes the Soviet Union is able to monitor microwave relays over which such messages are sent, and that the Soviets probably learned about the memo.

Last March 28, Deputy Undersecretary of Defense Seymour L. Zeiberg is reported to have talked with Boeing's Plymale. Plymale's statements made Zeiberg suspicious that Plymale had seen the secret memo. When Zeiberg asked him how he knew so much, Plymale reportedly replied that his information came from a brown envelope sent to Boeing by an unknown source.

ZEIBERG'sS suspicions about Plymale's story led to the investigation. According to The Times, the investigators charged Boeing employes tried to stymie them by destroying real documents and creating fakes. The report said the truth came out only when O'Rourke, Boeing's man in Washington, agreed to tell it.

Gen. Hecker said Boeing could have obtained information on the missile system through official channels.

He said there is a regulation outlining "how all information is treated. It outlines what the accessibility is, who has clearance and so on. It prescribes the proper way to give information to contractors. They have a right and a need to know what we're doing and the mechnanism allows that flow of information to exist."

Boeing reprimands workers for misleading government

SEATTLE (UPI) — The Boeing Co. Thursday took disciplinary action against five employees, including a vice-president, for mishandling sensitive information on a new missle project and misleading government and company investigations into the matter.

Boeing did not name the employees, but they are reportedly vice-president Benjamin T. Plymale; William H. Jacaway, a Plymale aide; Charles Welling, the company's Washington, D.C., office manager; and James L. O'Rourke, the Boeing employee whose actions allegedly led to the security breach.

An unnamed secretary also was disciplined, while a sixth employee was declared innocent of "improper conduct."

In a prepared statement, Boeing said some of the five employees had received substaintial pay reductions. The company said the discipline was a result of its own investigation.

The alleged security breach took place last March when O'Rourke reportedly transmitted a top-secret memo written for President Carter on a futuristic missle, the M-X, over a telecopier machine from Boeing's Washington, D.C., office to the company's aerospace headquarters in Kent, Wash.

The incident was first brought to light when the Pentagon suspended the top-secret security clearances of all six employees. Boeing has asked that it be restored for the one secreatary.

Reagan aide temporarily lost security clearance at Boeing

SEATTLE (AP) — A Boeing executive who is serving as a defense adviser to President-elect Reagan was once disciplined for breaching national security on a top-secret report on the MX missile system, a Reagan aide has acknowledged.

Ben T. Plymale, adviser on Reagan's Defense Department transition team, was demoted and temporarily lost security clearance in 1979 while serving as marketing vice president of the Boeing Aerospace Co. He improperly acquired and handled a top-secret report on the MX prepared by the Pentagon for President Carter.

The security leak was revealed in March 1979. A year-long Defense Department investigation showed that Boeing's Washington, D.C., representatives obtained a copy of the secret memo from Pentagon officials. The memo was sent by telecopier from Washington, D.C., to Seattle on an "open" rather than a "secure" phone line.

Results of the Defense Department probe were turned over to the Justice Department, but no criminal charges were filed.

Boeing spokesman Pete Bush said Tuesday that Plymale's security clearance was later reinstated by the Defense Department.

"Once it's restored, you're back where you were," Bush said.

Plymale was unavailable for immediate comment. He is on paid leave from Boeing, where he coordinates the development of flight instrumentation for the new 757 and 767 aircraft.

Plymale was deputy director for strategic and space systems in the Office of the Director of Defense, Research and Engineering, from 1968 to 1972 in the Nixon administration.

Charles Kupperman, assistant leader of Reagan's Defense Department 13-member transition team, said officials were aware of Plymale's involvement in the security breach, but "he's been fully exonerated of all that."

Kupperman said Plymale is a good engineer who knows defesne strategy and production. "If we're serious about this, then that's the kind of people we need," he said.

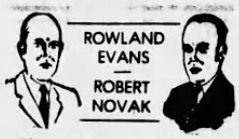
Inside Report

Weinberger Makes It Clear Who Is Boss

WASHINGTON — Unease within the defense community over Caspar (Cap) Weinberger has blossomed into panic now that the secretary of defense-designate has booted out "Reaganaut" military advisers, trashed their recommendations and at least opened the door for soft-liners.



The certain appointment of Frank Carlucci, the Carter administration's deputy CIA director, as deputy secretary of defense is the visible tip of concealed events. In a Dec. 20 shouting match, Cap the Knife fired defense expert William Van Cleave as transition chief, blackballed him and his team from Pentagon posts and consigned their reports to ash cans. Since then, a collection of personalities never connected with strong defense have been edging into the Reagan transition.

The most charitable explanation is that this is no conspiracy but the product of Weinberger's nearly total ignorance on defense questions, which was fully revealed in his Senate confirmation hearing. But assuming Weinberger finally learns the names and issues involved, he has lost valuable time in revising defense spending and lost invaluable experts he badly needs.

In this as in other transition wars these past two months, Ronald Reagan's presence is barely felt. There has been no gesture from either the president-elect or his chief aide, Ed Meese, that they regard a radical reconstruction of the nation's depleted defenses as top priority.

Consider the Reagan-Meese view toward Weinberger's insistence on Carlucci, a civil servant with no Defense Department background, as deputy secretary. Reagan's "kitchen cabinet" unanimously recommended against it, as did his defense transition team. The president-elect might then have suggested saving the deputy secretary's spot for an expert. Instead, Reagan acquiesced.

That was the situation when Van Cleave, Reagan's defense adviser throughout the campaign, went to California Dec. 20 to brief Weinberger. The secretary-designate was in an ugly mood. He unjustly believed Van Cleave was responsible for a press campaign against Carlucci.

An icy Weinberger informed Van Cleave that he and his team's services were terminated forthwith. The hot-tempered Van Cleave shouted that his responsiblity was to advise Reagan himself and Weinberger could not fire him. Weinberger shouted back that Van Cleave was deceiving himself; he was gone.

Weinberger was correct. Early in the transition period when Van Cleave crossed swords with transition overseer William Timmons, a Timmons aide asked Meese whether Van Cleave was under the president-elect's protection. No, replied Meese, fire him if you want. The trouble blew over temporarily, but Reagan has not come to his defense adviser's aid.

Van Cleave was not the only victim. His team's members, including some of the nation's leading military experts, are blackballed. That includes the highly-esteemed Ben Plymale of Boeing, who made the disastrous Dec. 20 trip west with Van Cleave. Plymale had been expected to be an adornment of the Reagan Pentagon as under secretary for research.

The defense plans fastidiously prepared by Van Cleave, Plymale and associates will never be read by Weinberger. That may well prevent any Reagan hurry-up plans for accelerated spending in the current fiscal year.

Pentagon offices formerly occupied by the Van Cleave team are now mostly empty. In charge of the skeleton crew there is an old Weinberger-Carlucci comrade from HEW days in the Nixon administration: William Howard Taft III, a Washington lawyer who knows even less about defense than Weinberger and Carlucci. Yet, incredibly, Taft has wound up on the list for the department's No. 3 post; under secretary for policy.

Taft has been conferring on defense matters with Richard Stubbing, a Carter administration anti-defense expert at the Office of Management and Budget (OMB) whose views generally coincide with Sen. George McGovern's. With Reaganauts exiled to oblivion, among those briefing Weinberger for his confirmation hearing were two Carter officials; Jack Stempler, assistant defense secretary for legislative affairs, and Brig. Gen. Carl Smith, military assistant to Defense Secretary Harold Brown.

Carlucci has been consulting with his close friend (another HEW old hand), John Rhinelander — who was a passionate arms-controller as a State Department lawyer. Carlucci told us Rhinelander will not go into the Reagan administration and denied he even knows Barry Blechman, a former Carter administration arms-controller now at the Carnegie Endowment. But a memo circulating on Capitol Hill lists Blechman as a possible assistant secretary of defense.

There are antidotes. Secretary-designate Alexander Haig has moved quickly to install a Reaganaut staff at the State Department. The National Securtiy Council (NSC) staff will be filled with Reaganauts, possibly including Van Cleave. Despite his less-than-reassuring confirmation testimony, Weinberger may soon learn enough to reflect Reagan's philosophy in personnel and policy. But for now, one Senate conservative is calling Weinberger "another Harold Brown with one difference — Brown knows something about defense."

Bible Digest

"A man's pride shall bring him low: but honor shall uphold the humble spirit." Proverbs 29:23 Pride is a killer that has slain many spiritual giants. When a person gets wrapped up in himself he makes a pretty small package.

"I am the bread of life." John 6:48 In an age of miracles and mechanism, it is a sad report that half of the world goes to bed with empty stomachs, because the other half retires with empty hearts.

2016 (Nov 02) Blog - "National Security Violations, Murder Cover-Ups, Secret Families and Corruption"

Source - [HW005F][GDrive]

Much of the above comes from the **1995 book When the Pentagon Was For Sale by Andy Pasztor**, in which Ben features prominently.

https://archive.org/details/whenpentagonwasf00pasz/page/n5/mode/2up

Ben [Playmale's] best friend was [Melvyn Robert Paisley (born 1924)], a colleague and fellow executive at Boeing. In the late 1960s, Melvyn lived on a farm in Kent, Washington and was married to his second wife, a younger woman named **Mary Lou** who enjoyed painting as a hobby. **Then on May 8, 1968, Mary Lou's dead body was discovered in their home in suspicious circumstances. She was found in the bathroom, lying face down and her head was surrounded by towels laced with carbon tetrachloride, a toxic cleaning fluid that she used to clean her paint brushes. The story that Melvyn gave was that she had gotten drunk and she took sleeping pills the night before and then accidentally asphyxiated herself with the cleaning fluid.** There was a police investigation and an investigation by the coroner. Her death was officially ruled an accident and the matter was officially dropped.

Despite the cause of death ruling, the matter was not dropped entirely; mostly because Mary Lou's sister didn't believe the official version of events. It became clear that there was more to the story, and the possibility of a cover-up and a murder became plausible. Twenty years later, when Melvyn was being investigated for separate corruption charges while working in the Pentagon, the case was reopened by King County. **It became clear that there were many inconsistencies and inaccuracies with the autopsy report, including the fact that the report found no traces of alcohol or sleeping pills in her system and the fact that the coroner who performed the report also worked for Boeing and somehow kept the report from review by his boss, the head coroner. There was also the revelation that not long before her death, Mary Lou had discovered or speculated that Melvyn was having an affair and had hired a private investigator to follow her husband. (Seven months later, Melvyn married the woman he was having an affair with.)**

Also damning was that – according to phone records – after Melvyn discovered his wife's body, the police was not the first number he called. The first number he called was his attorney and the second was his best friend, Ben Plymale. Then that morning, my grandfather's wife Susan went over to their house to clean it before the county authorities arrived. Susan apparently cleaned or threw away what the investigators assumed was vital evidence. That afternoon the investigators also noted that a fire was burning in the fireplace, which they remarked as unusual because it was May and not cold outside. The inference was that some evidence was probably incinerated in the fire.

Although the investigation was reopened in 1988, no additional charges were ever filed and Mary Lou's death still remains classified as an accident. However, given the circumstantial evidence, it is likely that there was more to the story. Was Mary Lou Paisley was murdered? If so, my grandfather and his wife were directly involved with covering up the crime. Interestingly, for decades after the fact, the case of Mary Lou Paisley was used an example by the King County Sheriff's Office as an example of how *not* to investigate a crime scene. [...]

GRATEFUL TRIBUTE TO BEN T. PLYMALE

HON. JACK F. KEMP

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 10, 1981

[HG008S][GDrive]

Mr. KEMP.

Mr. Speaker, on August 8, I lost a friend-and the United States lost a patriot. His name was **Dr. Ben T. Plymale**, a brilliant defense strategist and engineer. Ben's formidable talents were placed in service of the Nation on many occasions: From 1968-72, when he served as Deputy Director of Defense Research and Engineering, and most recently as second in command of the Defense transition team.

Ben's judgment in matters of national security was held in highest regard by his professional colleagues, bringing distinction to the Boeing Corp., which he served with singular dignity and loyalty for 30 years. But his friends will remember him best for his forthright honesty; his knack for seeing the essence of any issue or individual, and stating his opinions without hesitation or equivocation; and the special touches of humor that could come only from him,

reflecting both his sense of realism and the uncompromising principles by which he lived.

While critically ill from cancer and a failing heart, Ben devoted countless hours and bottomless energy to the campaign and transition work for Ronald Reagan. A leading candidateand my personal choice-for Undersecretary of Defense for Research and Engineering, Ben withdrew his name from consideration for the office because he feared that his poor health might impinge upon his ability to continue to serve in an official capacity. But his advancing illness did not detract from his unofficial, uncompensated service to the Nation, as he completed work on the alternative defense budget President Reagan commissioned his campaign task forces on defense to prepare, and he actively participated in internal debates over the future of U.S. strategic forces. With this, and much more, how can we begin to measure the contributions Ben has made to the security of our Nation?

I am proud to have known Ben Plymale, and to offer this tribute as a token of my gratitude for his advice and friendship and for the high service he rendered the United States.

At my request, just a week before his death, Ben prepared discussion papers on several key issues in the MX-ICBM debate. Now I believe it only fitting that I share this work with my colleagues, that the country might have the benefit of his counsel one more time:

ISSUE PAPERS BY DR. BEN T. PLYMALE

I. LAUNCH ON WARNING OF ICBM'S

"Launch on Warning" is being discussed as one of the possible options to ensure survivability of ICBM's against preemptive enemy arguments related to this option.

The Launch on Warning concept calls for launching our ICBM's following warning information to the effect that enemy missiles are actually on their way, and are aimed at our ICBM launch sites. In this sense, Launch on Warning <LOW) is not preemptive, since it will only take place upon reliable evidence that the enemy has actually fired its first strike.

On the pro side of the LOW issue, one must recognize that if our ICBM's are launched on warning, they will "survive", in the sense that they will destroy the intended targets (subject to the usual attrition factors due to reliability and penetration). It is also possible, although by no means proven, that the improvements in the warning and command and control systems which could make the Launch on Warning concept technically acceptable would result in somewhat lesser overall cost than looking to completely new systems to ensure survivability.

The arguments against the attractiveness of the LOW concept are many and interacting. For reasons of clarity, they are grouped here into four categories: Technical, Military, Policy and Cultural.

1. Technical

The LOW concept depends on sensors to detect that an attack is in progress, on communication links to relay the sensed information, on data processing equipment where sensed information is combined to gain increased confidence, and requires an override <or veto> function, to give the President or National Command Authority the option of circumventing automatic response.

Under many situations, many different types of sensors can be used to enhance strategic warning and increase system confidence. However, we must provide protection against a totally unexpected <surprise> attack or be vulnerable to its consequences. Only satellite sensors and early warning radars are useful in this context. In the LOW context, false alarms, due to equipment failures that report an attack are catastrophic in that they result in an unwarranted nuclear war, so a high degree of equipment redundancy is absolutely required. Failures that result in not reporting an attack when one is in progress are also catastrophic. When the attacker can cause such failure he is motivated to attack rather than be deterred. When these are not caused by the attacker, he may be deterred to some extent, but the survivability feature of LOW has, nonetheless, failed.

In any redundant systems, some form of "voting" mechanism is needed to reject or accept the inputs received from the sensors. While the sensors and communication networks can be made highly redundant, in the end the "voting" mechanism will be the weakest link in the confidence building chain. Within our ability to forecast and plan, the technology state of the art will not support a data processing mechanism with sufficient confidence to chance a nuclear war when one is not called for.

The LOW veto power given to the NCA is more cosmetic than real and may indeed be counterproductive as discussed below. If the NCA had any independent basis on which to execute a veto, such basis would be incompatible with the LOW mechanization to increase its reliability and confidence.

Even though the performance of the warning, command and control system can be tested to a certain degree in the field, the possible destruction by means of enemy attacks on key elements, or the possible degradation by means of enemy countermeasures cannot be accurately predicted or essentially precluded. This introduces a further element of uncertainty in the decision process implied in LOW approach to survivability.

2. Strategic

Our deterrent capability against the Soviet Union is further weakened by allowing the Soviet decision makers any room for doubt about the reliability of our retaliatory strikes. If it is possible for the Soviets to interfere with our warning, command and control systems even for the short time span required for the LOW to offer its alleged advantages, then such doubt becomes possible with possibly catastrophic consequences.

The short period preceding the irrevocable commitment of our missiles in the LOW mode precludes retargeting, i.e., changing the targeted aimpoints prior to launch. This, of course, deprives the ICBM force of one of its most attractive attributes, flexibility coupled to accuracy.

Retention of a secure reserve force, capa-· ble of supporting our national objectives over long protracted periods of nuclear warfare, is considered as a paramount requirement of our strategic posture. To various degrees, the other elements of our strategic TRIAD exhibit deficiencies in regard to this essential characteristic of endurance. Making the ICBMs dependent on LOW for survival would in effect deprive this segment of the TRIAD from any degree of enduring survival.

3. Policy

Our policy is, and is expected to remain, to endure any conceivable attack on our strategic nuclear forces and to decide the appropriate response following careful assessment of our then apparent national interests and objectives. Under no circumstances should the President be faced with the dilemma of either losing significant fraction of all strategic nuclear forces, or launching them against a previously established target set which may not at that time be consistent with our national interest. If for instance our ICBMs are targeted in the "counterforce" mode, they may be simply wasted on empty enemy

launchers. If our LOW salvo is even partially aimed at Soviet urban/industrial targets, we may precipitate a Soviet retaliatory strike against our own cities. This could result in excess of 100 million U.S. fatalities. If the original attack was limited to our ICBM force and we survived the attack, assessed damage and limited our response to a counterforce attack we might well be able to terminate hostilities with as little as 10 million fatalities. An automatic LOW response almost guarantees the deaths of half or more of our population.

The LOW concept implies that the President has the capability to effect a massive ICBM launch against Soviet targets by simply not exercising his veto power to stop and otherwise irrevocable LOW process. In effect then, the President can, by default, start a nuclear war on the basis of the (possibly automated) command and control decision process, overlaid by his personal judgment in regard to a matter of such momentous consequences. He may, if there is time, consult his personal advisers, but he is more likely to make the ultimate decision on the basis of his own deeply held standards, convictions and prejudices. The Cabinet may not be at hand on short notice; but consultation with Congress, as required by law in matters of exercising war powers, is certainly out of the question.

4. Cultural

Irrespective of the formally prescribed process for leasing nuclear weapons, the individual exercising the functions of the National Command Authority <NCA) faces a problem of unprecedented nature and magnitude when it comes to commit, or not to veto, the massive use of nuclear weapons. When the decision must be taken in a matter of minutes, when the views of the advisors are confused or conflicting, and when the outcome would result in certain death for tens of millions of human beings, it is almost certain that the NCA's decision will be against the launch of our weapons. This simple fact deeply rooted in our cultural background, is largely independent of the political persuasion of the individuals involved and cannot be changed by additional refinement in equipment or procedures. It is a massive argument against the alleged survivability afforded by the Launch on Warning concept.

II. BALLASTIC MISSILE DEFENSE OF ICBM'S

Introduction

Solutions to the ICBM survivability question, with major emphasis on basing alternatives, have been studied by the past four administrations, examined in depth by innumerable expert panels and committees, and further reviewed extensively by the Congress. Alternative survivable ICBM deployments were analyzed based on proposals from basement inventors, universities, "think tanks", major defense contractors, and the Armed services.

As a result of this exhaustive public review and the ongoing R&D program, the MX MPS system advantages and disadvantages are well understood. However, an uneasiness still persists with respect to some perceived disadvantages of MX MPS basing-such as the environmental impact. This continuing uneasiness has led to a compulsion to discover a quick and easy answer. An active defensive system or ABM is now a candidate to solve the ICBM survivability problem. But is the ABM technology ready and can the proposed ABM concept do the job? ABM systems have not been given serious consideration in recent years because of concern over < 1) adequacy of ABM technology in the nuclear environment, (2) effectiveness against a reactive threat, (3) MPS shelter proliferation cost advantage over ABM total costs, and (4) ABM treaty constraints.

LoAD's ability to improve MX survivability is doubtful

The LoAD system, proposed to defend MX MPS, may cause MX to fail catastrophically by contributing to compromise in Position Location Uncertainty <PLU) before an initial attack. LoAD also could cause MX to fail catastrophically if a low level "spoof" attack forces LoAD to reveal the MX location, even if pre-attack PLU is not compromised. LoAD was not designed to engage a responsive Soviet threat, which might include maneuvering RV's, anti-radiation homing RV's, jammers, decoys, or a myriad of other potential countermeasures.

The ability of ABM's to protect ICBM's launchers in known locations has not been proven adequately

An ICBM, in a silo of known location, will be subject to saturation attack, not only on itself, but also on any defensive system designed to protect it. The reason that no U.S. operational ABM system exists today is that no one has been able to show cost effectiveness and technological feasibility for such a system.

Abrogation or modification of the ABM Treaty will be done deliberately, not by default

There exists in Congress a significant number of members who look to SALT type treaties to guarantee a stable strategic balance with the Soviets. If the current ABM treaty is to be modified or abrogated, Congress will insist that such action be weighed and argued on its own "arms control" merits rather than backing into such a decision by committing ABM for the defense of our ICBM's.

Conclusion

At this point, it is premature to make a major commitment to ABM defense of ICBM's. However, ABM systems show sufficient promise to warrant aggressive R&D, within the confines of the existing treaty, to resolve the critical technical questions while the larger national security issues related to ABM undergo the test of public debate.

III. AIR LAUNCHED MX IN THE CONTINUOUS AIRBORNE ALERT BASING MODE ("BIG BIRD")

1. The continuous airborne alert basing mode for the air launched MX does not satisfy the major mission requirements

The continuous airborne alert basing concept calls for deployment areas over the oceans. Such deployment is, to a considerable extent, vulnerable to surprise attack. The Soviets are in position to develop specifically tailored "reactive threats," including surveillance and weapon delivery, which could in a time frame well within our planning horizon, preempt the MX force. Typical surveillance systems might be based on land or ship-based over-the-horizon <OTH> radars or satellite radars: weapons could be delivered by long-range strike aircraft equipped with terminally guided air-to-air semi-ballistic or cruise missiles.

The potential Soviet threat to the MX carrier aircraft over international waters does not require the use of nuclear weapons to be effective. Individually targeted air-toair or surface-to-air interceptor missiles have at present operationally demonstrated short miss distances which result in very high aircraft kill probabilities while using conventional warheads. The potential for attrition and even preemption is a destabilizing factor in the strategic balance.

The continuous airborne alert based aircraft are severely limited in postattack endurance. The airborne endurance of the currently contemplated carrier aircraft is, at best, six to eight days. With less than ten nuclear weapons the enemy can destroy the main operating bases provided for recovery; with a few hundred weapons the enemy can destroy dispersed emergency recovery airfields as well. In both instances, this is a very small price for him to pay to force us either to launch the MX missiles <which may result in immediate escalation to uncontrolled levels of general nuclear warfare, including attacks against

our cities), or to lose the whole MX system for lack of usable recovery bases.

Airborne deployment, especially when constrained to slow, low-flying (propeller) aircraft in the interest of fuel economy, has all the disadvantages of placing major nuclear assets over broad ocean areas not under sovereign U.S. control. In this sense, airborne deployment has the disadvantages of submarine basing without the corresponding unique benefits of submarines: relatively long on-station endurance <up to 60 days) and being essentially unaccessible to wide-area surveillance.

2. The effectiveness of the proposed implementation concept<s> is open to question

The current configuration of the MX missile has not been defined in keeping with the requirements for air launch. Its size, range, and_payload capability are not even close to that -needed for an air launch role. There is no evidence based on test programs to show that an MX-size missile can be launched from the proposed aircraft. No commitment to such a system should be made until this capability is verified by tests.

It is possible, and indeed likely, that other missile configurations <two Minuteman III missiles or several small, single reentry-vehicle missiles in the 20 to 25,000 lb. gross weight range) may be more suitable for the air launch deployment role.

In order to ensure even a minimal level of protection against surprise attacks, major defense assets (sea/air based air and antimissile defense) would have to be diverted from the U.S. general purpose forces. The cost of these defensive assets must be included when assessing the effectiveness of the airborne alert type deployment. Defensive assets will have to be provided from our heavily committed general-purpose forces inventory, if the enemy chooses to increase his preemptive threat against the MX airborne deployment.

The cost for the enemy to preempt an airborne alert based weapon system is considered to be much smaller than the resources required to preempt the MX in their landbased multiple shelter mode. The latter, for sake of comparison, imply the expenditure of 4,600 high-accuracy warheads or, alternatively, remarkably sophisticated intelligence/ surveillance, retargeting capabilities.

Air-deployed intercontinental missiles not having access to accurate azimuth references will have delivery accuracy significantly inferior to those associated with land-based ICBM's. This can be remedied at the additional cost of radio beacon based inflight updating, which in tum introduces its own vulnerability risks.

Relatively low altitude, fuel efficient flight profiles (5,000 to 15,000 ft.) and propulsion techniques are required in order to give a minimum level of airborne endurance (six days). Such flight profiles imply accident rates far exceeding those normally associated with modern jet aircraft, and certainly far in excess of those associated with land basing. Extended deployment ranges may require flight through turbulent atmospheric regions where the accident rate would be higher still.
